27 X Q. There was no special circumstance connected with the furnishing of the woods to Mr. Man in 1878, was there?

A. No, sir.

28 X Q. And you hadn't thought about the woods you furnished him in 1878 until he asked you about it eighteen months ago?

A. No, sir.

29 X Q. You made no written memorandum of the fact that you furnished Mr. Man those woods in 1878, did you?

A. No, sir.

30 X Q. And you testify wholly from recollection?

A. Yes, sir.

31 X Q. Have you now, or have you ever had, any business relations with Albon Man other than furnishing these woods?

A. Nothing but selling him fishing tackle.

32 X Q. When were you subpenæed?

A. I came on the application of Mr. Broadnax.

33 X Q. Have you received any fees as a witness?

A. No, sir.

34 X Q. Mr. Man is an old customer of yours and you came

voluntarily as a matter of friendship and regard for Mr. Man, I suppose?

2324 A. Yes, sir.

35 X Q. Do you mean to say that there has been no conversation between you and Mr. Man in which he referred to the different kinds of woods which your furnished him in 1878?

A. Well at the time that he spoke to me first, he asked me if I remembered the kinds of wood I gave him, and I told him yes, I named over the same woods I have spoken of in my testimony.

36 X Q. At that time or at any other time prior to this examination did Mr. Man mention the fact that he had obtained bamboo of you in 1878?

A. I acknowledged to Mr. Man at the time he asked me that I had given him bamboo among the other woods.

37 X Q. Did he also acknowledge that you had done so?

A. Yes, sir.

38 X Q. What did he say to you about getting bamboo of you in 1878, at the time of this alleged interview?

A. He said nothing at all about bamboo.

39 X Q. Then Mr. Man at the time of this interview of which you have testified, manifested no interest whatever in the fact that he had obtained bamboo of you in 1878?

A. No, sir.

EDWARD BERRY.

2325 NEW YORK, *April 26th*, 1889—10.30 a. m.

Met pursuant to adjournment.

Present: Counsel as before.

It is stipulated by counsel that the volume entitled "Report from the select committee on lighting by electricity; together with the proceedings of the committee, minutes of evidence and appendix," portions of which have been quoted by Mr. Pope in his answer to question 193, may be read from at the hearing in this case, with the same force and effect as if the volume had been duly offered in evidence, so far as the same relates to the matters referred to by Mr. Edison and Mr. Pope with respect to the evidence given before the parliamentary committee on the subject of the subdivision of the electric light.

Cross-examination of the witness by defendant's counsel:

202 X Q. In your answer to question 193, you have referred to three applications of the incandescent electric light. To which of those applications does Complainant's Exhibit Defendant's Lamp relate?

A. It relates to the first application; that is to say, central-station lighting. It might be used without any particular disadvantage for isolated lighting also.

203 X Q. It, however, is not adapted for the third application described by you?

A. It is not. A lamp for the third application should have a shorter and thicker carbon.

204 X Q. With regard to the Sawyer patent No. 194,111, referred to by you, do you consider that patent as describing a fundamentally correct system of distribution in parallel or multiple arc for incandescent lamps such as you seem to be of the opinion by your answer 193, had been described in the Sawyer or Sawyer & Man patents prior to September, 1878?

A. The patent referred to does not describe a system of
2326 distribution in parallel at all, but a system of distribution in
series.

205 X Q. Is it such a system as has been practically used in the first application of the incandescent lamp referred to by you, namely, "general domestic or house-to-house lighting, now generally termed central-station lighting," or for the second application of incandescent lamps referred to by you?

A. It shows one prominent feature of modern central-station distribution by direct currents, which consists in leading more than one conductor for supplying lamps from each terminal of the electric generator, but it does not show this system carried out in detail in any of the separate circuits supplied from a common generator.

206 X Q. What is the kind of electric lamp shown and described in this patent?

A. The only lamp shown in the drawings is an arc lamp, but in the specification this is referred to as an "electric lamp or other apparatus" and various other kinds of apparatus are elsewhere suggested in the specification as for electroplating, heating and motive power.

207 X Q. The electric lamp, however, specifically described and shown is an arc lamp?

A. Yes.

208 X Q. Do you consider that the Sawyer patent No. 196,834, referred to by you, describes a fundamentally correct system for incandescent lighting?

A. It certainly does so far as concerns the distribution of the current through parallel mains and parallel cross-branches, each of which can be opened and closed without affecting the others. It is not correct, or at least not in accordance with good practice to provide resistances for shunting the lamps, as these are of no use. Therefore I should express my opinion by saying that the system is correct in its general plan and incorrect in the details of the lamp connections.

209 X Q. Would not the use of the continuity-preserving
2327 switches, as shown in figures 1 and 4, involve a fatal error in
principle, which would be destructive of the operation of the
system for any practical purpose?

A. I would hardly be willing to go so far as that. The objection to the device is that practically the same amount of energy is consumed, irrespective of the number of lamps lighted, whether one or many. Subsequent to the date of this patent, means were invented or discovered of regulating the supply of current at the generator in accordance with the requirements of consumption, and as soon as this had been done, such devices as those shown in the patent now under consideration at once became useless and unnecessary.

210 X Q. Would not the substitution of a short circuit, such as would be formed by closing the continuity-preserving switch F G, for the resistance of the arc lamp B B, have the effect of short-circuiting the lamps in the system, so as to deprive them of a proper amount of current, and to cause an abnormal flow of current which might be destructive of the conductors which carry the current?

A. Such would probably be the case if it were applied in what is known as a multiple-arc system of distribution, such for instance as figure 4, or figure 5, if we assume the latter to be a multiple-arc circuit.

211 X Q. Is not the object of this patent No. 196,834, as shown by the matter beginning with the bottom of the second column of the first page of the specification, and continuing on the second page, to substitute a multiple-arc arrangement for the series arrangement of the earlier patent, No. 294,111?

A. Unquestionably.

212 X Q. Then this patent, No. 196,834, so far as the apparatus shown in figures 2, 4 and 5, is concerned, describes an absolutely inoperative arrangement?

A. Yes, I think it may be so considered.

2328 213 X Q. With respect to the apparatus shown in figures 1 and 3 of this patent, is that arrangement used in practice in multiple-arc systems of lighting by incandescence?

A. It is not. The modern arrangement is to place the lamp and the switch for turning it on and off, directly in the cross-circuit, and to omit the resistance E which bridges over the switch and the lamp in figures 1 and 3.

214 X Q. The effect of the arrangement of figures 1 and 3 is to cause the consumption of just the same amount of electrial energy when one lamp is burning, as when the total number in the system are burning?

A. Yes, nearly that.

215 X Q. Isn't it exactly that, as shown from the following quotations from the patent itself?

"The operation of my invention will be readily comprehended from the drawings, the current from the generator J having a constant flow through each of the branches, whether the apparatus in that branch is or is not operating."

A. If the words quoted mean that the flow is constant as to quantity, then the assumption in your question is correct. If it means constant as to time, which meaning would accord better with the drawing, then the consumption of current is somewhat greater when each lamp is in action than when it is not. Of course it is not an economical arrangement in either case.

216 X Q. I should have completed the quotation in my last question by adding the closing words of the sentence, which are as follows:

"So that a single generator may be used to operate any number of apparatuses without the interference of one apparatus with another."

In view of this language, which of the two assumptions of your last answer do you consider the more reasonable?

A. Evidently the first one, because such interference would 2329 not exist unless the currents in the several branches were maintained at a constant strength, or there was some means of regulating the current at its source, which last is apparently not contemplated by the patentee.

217 X Q. Then the system described in connection with figures 1 and 3 of the patent, is one in which the same amount of current would have to be generated when one lamp is burning as when a thousand lamps are burning?

A. Yes.

218 X Q. Would you consider such a system practicable?

A. It would be entirely so for some purposes, but of course not for general lighting. It might be applied for example, to the lighting of streets, squares, markets, railway stations, and the like, where a large number of lamps are to be turned off and on at the same time. Of course in general domestic lighting, in which the lamps must be individually under the control of the consumers, it would be impracticable for economical reasons.

219 X Q. What would make it applicable to the lighting of streets, etc.?

A. The circumstance that when one lamp in the system is required, all the lamps are required, and *vice versa*.

220 X Q. That is, the whole current would be cut off or turned on at the source, and the resistances E would not be used at all; is that your idea?

A. My idea is that it might be used as the system of arc lighting in series was first used, all the lamps being as a rule turned on and off together, but devices being provided whereby an individual lamp could be discontinued if desired, though not with any decrease in the cost. It was not an economical system, as I have said, but on the other hand it was not without utility in the state of the art at that time.

221 X Q. It is a fact though, is it not, that the patent contemplates the use of the system for general house to house distribution, as shown by the second page of the specification?

2330 A. Yes, that was no doubt the intention of the patentee among other things; it was evidently designed to apply under any circumstances in which electric lights fed from a central station might be required.

222 X Q. You would hardly call it then a fundamentally correct system of distribution, as we understand the requirements of such a system at the present day?

A. Not in its details, certainly. It only marks a certain stage in the gradual development of the art.

223 X Q. In the patent of Sawyer & Man No. 205,305, you find "for the first time an apparatus for automatically regulating the production of electricity at its source," which you think is "a plan

which is now in universal use," and which you regard "as lying at the very foundation of all the approved modern systems." Is it not a fact that in the Edison central station system, the regulation is performed by hand?

A. It is partially performed by hand, I think, in the Edison and in all other central stations. In my answer referred to, I did not mean to say that it was especially the automatic regulation which was important, although the language is open to that construction, but the regulation of the production at the source in accordance with the consumption. It should be stated also that after the date of the Sawyer & Man patent 205,305, improvements were gradually introduced in the construction, and especially in the proportions of dynamo machines, due to a better knowledge of the mathematical principles governing the flow of current, by which these machines were rendered self-regulating to a very large extent, by the law of their construction, thus rendering the use of special apparatus for the purpose less important, so that in practice the self-regulation of the machines, with occasional assistance from the attendant, is perfectly competent to deal with the widest range of variation in the consumption.

2331 224 X Q. Then as a matter of fact, aside from the capacity of the dynamos to regulate themselves, the regulation in central station systems is performed by hand and not automatically?

A. Yes, I believe that this is true of all incandescent systems in which the units of light are small and the changes in consumption consequently somewhat gradual. The automatic method of regulation has found its widest application in series lighting, especially with arc lamps in which the changes are comparatively sudden; it is, I believe, in very extended use in connection with such systems.

225 X Q. The apparatus of this Sawyer & Man patent 205,305 has not then had an extended use for incandescent lighting?

A. No, I do not know that the particular apparatus described by them is in use at all, but this patent, nevertheless, is the first of which I have any knowledge, which contemplates the regulation of the production of electricity at its source, in accordance with the requirements of consumption, whether by the means described, or equivalent apparatus of other construction.

226 X Q. The apparatus shown and described in this Sawyer & Man patent is not an operative one, is it?

A. If the description and drawings be literally followed, I do not think it is. The person who prepared the specification has inserted a misdescription in a certain part of the mechanism, apparently not fully understanding the principles involved, which strictly speaking vitiates the description, so that a machine made in literal accordance with it would not be operative. An exceedingly moderate degree of skill and intelligence would be sufficient to set this matter right and make the machine operative. As a matter of legal sufficiency it may be that the specification is defective.

227 X Q. What portion of the apparatus do you refer to as misdescriptive?

A. I refer to the pulley C and cap D, in figures 1 and 2, one of
which is described as carrying the other along with it, by
2332 direct magnetic attraction, the two not being in contact.
This is of course absurd, and no such action could take
place. If, however, the parts were permitted to come in frictional
contact, then I have no doubt the machine would be an operative
one.

228 X Q. And you think this change would be made by the application of an exceedingly moderate degree of skill and intelligence and without the exercise of invention?

A. I think so. It does not seem to me that any invention is required to set the thing right, in view of the fact that the description in the specification is plainly erroneous, inasmuch as it would seem as if any one having any knowledge of the laws of magnetic attraction would know that the result set forth could not be obtained when the parts were not in contact.

229 X Q. Is it your view then that by rectifying the mistakes as to the pulley C and cap D, the apparatus of the patent would become operative?

A. I am very well satisfied that it would, as I have seen it tried, and it did operate successfully.

230 X Q. Did you not testify as an expert for the complainant in the suits pending in the U. S. circuit court for the southern district of New York, entitled The United States Electric Lighting Company and The United States Illuminating Company, complainants, against The Edison Company for Isolated Lighting, defendant, in equity Nos. 3415 and 3419, in which the Sawyer and Man patent No. 205,305 was set up as an anticipation by the defendant of the Farmer patent sued upon?

A. I did.

231 X Q. Did you not in that case testify as follows, with respect to the said Sawyer and Man patent:

50 X Q. This patent No. 205,305 describes, does it not, the invention of the Farmer patent in suit, or all that is essential to it, in your opinion?

A. It describes substantially a similar invention which was evidently designed to accomplish the same result.

2333 51 X Q. It describes the same method of regulation applied to the same kind of an electric lighting system as that set forth in the former patent, does it not?

A. It purports to describe the same method, although I have not been able to discover how the result can be effected by means of the apparatus described by the patentees. Assuming the apparatus to be operative, then, in my opinion, the method of regulation is the same, and it is applied to the same kind of lighting system as that described in the patent of Farmer.

* * * * * * *

53 X Q. Assuming the Sawyer & Man patent No. 205,305 to antedate the invention of Farmer, and bearing in mind the fact to

which I understand you have testified, that the separate elements of the Farmer regulating apparatus were not new with Farmer, would it, in your opinion, have required the exercise of invention, as distinguished from mere mechanical skill, to produce the apparatus described in the Farmer patent?

A. I think it certainly would require invention to pass from the Sawyer & Man apparatus to that of Farmer. In the first place I do not see how it is possible to effect the result aimed at by means of the apparatus described by Sawyer & Man, and even if it be assumed that the apparatus is operative, yet the substitution of more suitable mechanical devices would exhibit invention. Of course, in a broad sense, it might be said that the invention had been made by Sawyer and Man, and in this sense it could not be made again by another party in the capacity of a first inventor.

* * * * * * *

84 X Q. In what respect is the apparatus of the Sawyer & Man patent 205,305, defective?

(Objected to as not open.)

A. It is stated on page 2 of the specification, seventh line from top of first column that "the flange A' pulley C' and hub C' also become magnetic, and the tendency of the hub C' is to att-act the cap D in the direction of rotation of the pulley C, and thus to overcome the retractile force of spring F."

2334 It is stated in the second column of page 1, about two-thirds of the way from the top of the column, that the hub C', here called a flange, does not touch the cap D. In my opinion the statement above quoted to the effect that the hub C' will tend to attract the cap D in the direction of rotation of the pulley C, and thus overcome the spring F, is not true. The attraction will not be in the direction of rotation, but will be parallel to the axis and cannot in any way act to overcome the retractile force of the spring F. This is an essential point in the operation of the apparatus, and I am perfectly satisfied that it cannot possibly be made to operate in the manner and by the means set forth in the specification and shown in the drawing.

* * * * * * *

"106 R. D. Q. Do you find in the Sawyer & Man patent the organization of circuits described in the Farmer patent and referred to in the claim, or any equivalent therefor?

"A. The patent of Farmer describes a number of circuits in parallel or multiple arc, each containing a lamp, and one containing an electro-magnet, which acts to control, simultaneously, the current in all the branches of the system, without producing any other effect upon the branch in which it is itself situated than it does in any other branch. There is no circuit in the Sawyer & Man apparatus which fulfills this condition. The operation of the controlling device, assuming it to be operative, which it is not, would act to vary the resistance, and consequently the strength of the current in its own branch of the circuit independently of its action upon the system as a whole, and it would thus introduce an element of error and uncertainty in the regulation. There is no controlling branch of uniform resistance in the Sawyer & Man apparatus.

"107 R. D. Q. Would this difference, in your opinion, be a material one so far as the action of the regulator is concerned? You may assume for the purpose of this question that the controlling device of the Sawyer & Man patent operates to open and close the local circuits in the manner described in the specification.

2335 "A. I think it would. I think it would introduce an error into the regulation, that is to say, it would permit of a variation in all parts of the system, above and below the normal strength of currents, which would be fatal to the successful operation of incandescent lamps.

* * * * * * *

"112 Re-D. If the controlling device of the Farmer apparatus were substituted for the controlling device of the Sawyer and Man apparatus; would the Sawyer and Man apparatus be, in your opinion, operative, without any further changes? In this connection I call your attention to cross-question 87?

"A. My answer to cross-question 87 was based upon the assumption which I have since discovered to be an erroneous one, that the Sawyer and Man apparatus was an operative one, except in the particulars specifically pointed out in my answer to cross-question 84. As I said in my answer to cross-question 85, I had not then minutely examined the patent in its other details. I now give it as my opinion that the substitution of Farmer's controlling mechanism for that described by Sawyer and Man, would not be sufficient to render the Sawyer and Man apparatus an operative one.

* * * * * * *

"118 Re-X Q. I understand from your cross-examination that at the time you gave your answer to cross-question 44, you were of the opinion that the Sawyer and Man patent described 'the invention of the patent in suit or all that was essential to it,' that later on in your cross-examination you modified your opinion to the extent that you found the primary controlling device of the Sawyer and Man patent inoperative, but that if it were replaced by the primary controlling device of the Farmer patent (which you admitted was old before the patent in suit), the Sawyer and Man apparatus would then be operative. Then when it comes to your redirect examination you had still further changed your opinion with regard to this Sawyer and Man patent, and had made up your mind that
2336 the arrangement of circuits in the Sawyer and Man patent
was also inoperative. This last opinion is expressed in your answer to redirect question 106. Am I safe in assuming that you have now reached your ultimate conclusions in regard to the Sawyer and Man patent?

"A. When making my answer to cross-question 44, I was aware of the inoperative character of the primary controlling device of the Sawyer and Man patent, and I ought to have stated explicitly in my answer that it was based on the assumption that the apparatus operated in the manner evidently contemplated by the patentees. I had not at that time observed the effect of the peculiarity in the arrangement of the controlling circuit referred to in my answer to redirect question 106. My study of the specification has not as yet developed any other essential defect in the construction and intended mode of operation of the Sawyer and Man apparatus. I am willing to let my answer to redirect question 106 stand as my ultimate conclusion in regard to this patent.

"119 Re-X. Q. To what specific features of the Sawyer and Man apparatus do you refer in your answer to redirect question 106?

"A. To the branch circuit, which contains the resistances *q r* and *s*, and the lamp X. These resistances are placed in series in the branch, and two of them, that is to say *r* and *s*, are bridged or shunted by the operation of the regulating device in either direction, and this operation disturbs the relation of the current in the regulating branch to the other current in the other branches every time it takes place."

* * * * * * *

"126 Re-X Q. Taking the arrangement and connection of the apparatus as shown in the Sawyer and Man patent, and assuming the primary controlling device to be an operative one, please state explicitly why the Sawyer and Man apparatus would not be operative in your opinion?

"A. If the current from the generator U should tend to become too strong, this abnormal strength of current would tend to distribute itself equally between the several branches. 2337 The regulating mechanism would be brought into action, shunting out the resistance *r*, thus diminishing the total resistance of the regulating branch to a certain extent, and then the rheostat *s* would also be shunted out, still further decreasing the resistance and increasing the current in that branch, so that before the regulating apparatus could be brought into action at all to diminish the current, the current in the regulating branch would become considerably stronger therein than in the other branches, and thus the lamp or lamps in that branch would receive too much current. This inequality of division would continue so long as the regulator was at work diminishing the total supply. Hence when the current in the regulating branch had been reduced to the normal point, there would be too little in the other branches. Again, as soon as the current in the regulating branch had been brought to the normal point, the shunt would be taken off the rheostats *r* and *s* again, increasing the current in that branch only, which would, of course, set the regulator at work again to still further reduce it. In this way a series of fluctuations would occur, and it would be impossible to keep the apparatus steady at any one point.

"127 R. X Q. The apparatus would regulate, but not regulate very closely, is what I understand your opinion to be, am I correct?

"A. I hardly think it could be made to regulate at all, simply for the reason that the moment the current in the regulating branch is brought to normal, the taking off of the shunt introduces a variation, and this must necessarily take place every time the current is brought to the desired strength. In other words, the apparatus has no position of equilibrium.

"128 R. X Q. With the magnets and resistances properly proportioned, the parts would act to decrease the flow of current when it increases beyond a certain point, and to increase the current when it drops below a certain point, would they not?

"A. Yes; it would in a general way, but I do not think it could possibly act to keep the current at any fixed point. That is to say,
the strength of current would, owing to the action of the ap-
2338 paratus, fluctuate up and down somewhere in the vicinity of
the normal point.

"129 R. X Q. That is, it would regulate, but, in your opinion, not so efficiently as to maintain the current at a definite strength?

"A. I do not think such an apparatus can properly be said to regulate at all, inasmuch as it does not allow the conditions to remain unchanged when the current has been brought to the normal point. It may, perhaps, be said to regulate to this extent, that it would tend to diminish very great irregularities in the strength of the current, but the fact that it cannot remain in a condition of equilibrium prevents it from effecting anything like an accurate regulation."

A. I did.

232 X Q. Are the improvements in dynamos referred to in answer to 223 X Q. in the direction of providing the armatures with a lower internal resistance and constructing the field magnets of greater magnetic power than in the early forms of dynamos?

A. Yes, both these modifications are very important factors in attaining the result sought for.

233 X Q. Are not all the dynamos used in incandescent lighting at present constructed on that general plan?

A. They are.

234 X Q. Were not machines of this character first publicly proposed for use by Mr. Edison?

A. I cannot say positively that he was the earliest but he was certainly one of the earliest to propose them and to employ them in practice.

235 X Q. You never heard that Sawyer and Man or either of them, had produced machines of this kind?

A. Not to my knowledge.

236 X Q. With reference to the Sawyer meter patent No. 210,151, has such a meter as that described in this patent been introduced commercially?

A. Not in the United States; I think that I have heard of such a
meter being used to a limited extent in Europe. Other more
2339 economical, or rather, less expensive and more convenient
devices have been introduced since that date.

237 X Q. Is it not a fact that in all systems of electric lighting employing direct currents and covering large areas, feeding circuits

are employed, such as are described in Mr. Edison's patent No. 264,642, as well as indicators for indicating at the central station the pressure at the outer ends of the feeders, and regulators for regulating the flow of current upon the feeders, as described in Mr. Edison's patent 266,693?

A. I believe so.

238 X Q. Are not such features at present considered essential in general systems of lighting by direct currents, in order to effect the proper distribution of current to all the lamps?

A. They are in very extensive use for that purpose, although I should think it might be possible to do without them; probably they form the most economical arrangement known in respect to first cost of conductors in a direct system.

239 X Q. These features are not indicated by the Sawyer-Man patents, are they?

A. They are not.

240 X Q. Is it not a fact that in all systems of electric lighting employing direct currents and covering large areas, electric generators employed connected in multiple arc as described in Mr. Edison's patent 369,280?

A. I believe so.

241 X Q. And is it not a fact that the generators employed in such system have each an armature of low resistance, revolving in a magnetic field of great strength, as described in the same patent of Mr. Edison?

A. It is.

242 X Q. Are not the features referred to in my last two questions essential to a practical and economical system of the character referred to?

2340 A. A generator having an armature of small resistance in a strong field is essential or at least highly important in any system of incandescent lighting by direct currents. The arrangement of these armatures in parallel, two or more, is useful, convenient and economical, when the district to be lighted exceeds a certain size, and is perhaps essential when the district is very large in order to effect an economical distribution.

243 X Q. Are not the feeders, feeder regulators and indicators described in Mr. Edison's patent- No. 264,642 and 266,793 essential in direct-current systems, as a means of producing a uniform pressure over an extended area of distribution, irrespective of the number of lights in use?

A. Yes, I think it may be said that it would be a difficult matter to do this without these or equivalent appliances.

244 X Q. Do you find these or equivalent appliances in Sawyer and Man's patent 205,305?

A. No.

245 X Q. Your sixth criticism of Mr. Edison's position in the art, refers to his statement that at the time he undertook to produce a system of electric lighting, it was necessary to devise an economical dynamo machine; is it not a fact that for multiple-arc lighting it is essential to ecomony that the dynamos should have

armatures of low internal resistance, and the field magnets of great magnetic strength?

A. It is essential to a high degree of economy; that is to say, the nearer the dynamo approximated this ideal type of a field of maximum strength and an armature without resistance, the greater the economy.

246 X Q. Do you know of a description of such dynamo machines prior to February 5, 1880, the date of filing of the application upon which Mr. Edison's patent No. 369,280 referred to by you, was granted?

A. I do not recall any instance of a specific statement to that effect at an earlier date, although it was well known and had been pointed out by others, that the conditions of maximum
2341 efficiency in working with dynamos depended upon the diminution of the resistance of the armature as much as possible, proportional to the external working resistance. My impression is, without assuming to have exact knowledge on the subject, that Mr. Edison and his associate, Mr. Upton, pointed out at least as early as the date of this specification, the importance of modifying the proportions of the dynamo machine in the direction of increasing the strength of its field and of diminishing the resistance of its armature.

247 X Q. Was not the generally accepted theory of construction before that time, based upon the erroneous notion advanced most notably by Werner Seimens, that the most economical conditions under which to work a dynamo machine were reached when the internal resistance and the external resistance were equal?

A. This unfounded and erroneous notion prevailed very generally prior to 1878 and in many quarters for several years later. The fallacy of it was pointed out by Profs. Elihu Thomson and Edwin J. Houston, in 1878, in their discussions of a series of experimental tests made with dynamos of various constructions at the Franklin institute in Philadelphia.

248 X Q. With reference to the seventh criticism of Mr. Edison's position, you do not desire to be taken as stating that the use of safety fuses in electric circuits was original with Sawyer & Man, do you?

A. Broadly speaking, I do not think it was, as equivalent devices, that is to say, pieces of thin wire interposed in the circuit had long been in common use, as for example, for protecting telegraphic apparatus and submarine cables from discharges of atmospheric electricity. It was only new with Sawyer and Man in its application to electrical distribution circuits.

249 X Q. What was the announcement referred to by you at the end of answer 193?

A. I had in mind the announcement in the New York
2342 Herald in evidence herein, describing Edison's apparatus at Menlo Park.

Defendant's counsel offers in evidence copies of the specification and drawings of the three patents of Thomas A. Edison, on electrical distribution system, No. 264,642, dated September 19, 1882; No. 266,793, dated October 31, 1882, and No. 369,280, dated August 30, 1887, before referred to, and the same are marked Defendant's Exhibit Edison Distribution Patent No. 264,642; No. 266,793 and No. 369,280, respectively.

Adjourned to April 27th, 1889, 10.30 a. m.

NEW YORK, *April 27th*, 1889.

Met pursuant to adjournment.
Present: Counsel as before.

Cross-examination of FRANKLIN L. POPE continued:

250 X Q. Returning to the question of the operativeness of the apparatus described in the Sawyer & Man patent No. 205,305. You state in answer 229, that you have seen the apparatus tried. Did you refer to the whole apparatus, or only to the primary controlling element?

A. The apparatus that I saw tried embraced the series of machinery shown in the patent from the primary controlling element to the shaft O, which is intended to control the admission of steam to the driving engine. But in making my answer to X Q. 229, I inadvertently overlooked the fact that other changes had been made in the apparatus which I saw, in addition to the correction of the defect in the controlling element. These changes consisted in operating the electro-magnet, Q R S and T, not by currents derived from the wire in which the controlling magnet is
2343 included, but from a separate source. Therefore, I was in
error in saying in my answer to X Q. 229 that the apparatus of the patent would become operative upon rectifying the mistake as to the pulley C and cap G, inasmuch as the further change which I have just described had also been introduced into the apparatus.

251 X Q. You still adhere to the opinion, then, expressed in the testimony quoted in X Q. 231, that the apparatus of the Sawyer and Man patent 205,305, would not be operative, even if the defect in the primary controlling element C. D. were rectified?

A. Yes, I have re-read the testimony referred to, and see no reason to modify the conclusions at which I then arrived.

252 X Q. In your answers to X Q. 202 and 203, you have stated that Complainant's Exhibit Defendant's Lamp, is not adapted for the third application of the incandescent light which you have set out in answer 193; is it not a fact that the lamp of the patent in suit, by reason of the large size and low resistance of the carbon conductor would not be adapted for use in the first application set out by you in answer 196?

A. It would not be unless the length and thickness of the carbon filament were modified; that is to say, it would need to be much longer and thinner than that shown in the drawing in order to work successfully under such conditions.

253 X Q. That is, the carbon conductor would have to be given the filamentary form described in Edison's patent 223,898?

A. Yes.

254 X Q. In your second criticism of Mr. Edison's position in the art, set out by you in answer 193, you refer to Mr. Edison's statement that it was necessary for him to devise a suitable electric lamp for use in such a system, (which I understand is a fundamentally correct system) of distribution in parallel or multiple arc. You do not mean that the lamp of the patent in suit would be adapted for use in such a system without change, do you?

2344 A. Not if the precise dimensions shown in the patent were retained; what I meant by my statement was that the type of lamp in the patent fulfills the conditions; not necessarily the construction in detail there shown, for as I have said, that would not answer the purpose in a system of general multiple-arc distribution. The incandescent conductor of the lamp requires to be adapted in its length and thickness to the character of service required of it, precisely as does the wire which forms the actuating helix on an electro-magnet.

255 X Q. That is, the carbon conductor would have to be given the filamentary form described in Mr. Edison's patent No. 223,898?

A. Yes.

256 X Q. In your answer to question 196 you have referred to an article published in the Telegraphic Journal and Electrical Review, as showing that "the construction of an incandescent lamp of very high resistance" was not first disclosed in the Herald article of December 21, 1879. How does the paper in the Telegraphic Journal and Electrical Review anticipate that disclosure of the construction of individual lamps of very high resistance?

A. I do not mean to be understood as saying that it does. The article referred to points out the necessity for economical working, of making the resistance of the apparatus in which the work is done, what we nowadays call the translating device, as high as possible in proportion to that of the generator; that is to say, it tells us what ought to be done, but does not tell us how to do it.

257 X Q. It does not tell us that by making individual lamps of very high resistance, a multiple-arc arrangement of the lamps can be employed, does it?

A. It does not; but then I consider that that was a part of the common knowledge of the art. It was well known that whatever kind of translating devices might be employed, their resistance should be made high if they were to be connected in multiple arc,
and made low if they were to be connected in series, upon
2345 the assumption, of course, that the electrical energy to be
expended in each device was equal in either case. It was at that date a simple and ordinary matter of mathematical calculation.

258 X Q. The conditions of the article, however, would be fulfil-ed by securing the high external resistance by arranging arc lamps or low-resistance incandescent lamps in series, would they not?

A. They could be so fulfilled. The law laid down is a general one, and equally applicable to series or multiple-arc distribution.

258 X Q. Incandescent lamps having individually a very high

resistance not being known at the date of the article, it is a fact that to reach the conditions of high external resistance set out in the article with such incandescent lamps as were then known, it would have been necessary to arrange the lamps in series, would it not?

A. It would if any considerable number of them were to have been used. A moderate number might probably have been successfully arranged in parallel or multiple under the conditions then known, but not a very large number.

260 X Q. In answer 196 you refer to the Lane-Fox patent, No. 3988 of 1878. I understand your position to be that this Lane-Fox patent describes lamps of high resistance in a multiple-arc system. You do not pretend, of course, that the Lane-Fox patent describes suitable and operative apparatus for carrying out the general principle referred to, do you?

A. No, I don't think it does; it simply marked a certain stage of progress in the development of the art.

261 X Q. The lamp described is not a practicable lamp, is it?

A. It is practicable in the sense that it might be used so as to be serviceable in an electric-lighting system. It is impracticable in that the cost of the light produced by it would probably be more than the consumers would be willing to pay for it.

262 X Q. Such a lamp has never been used practically, has it?

2346 A. Not to my knowledge. That is to say, not commercially.

263 X Q. Would you consider it feasible to make a high-resistance lamp of platinum-iridium wire for the incandescent portion?

A. No, I think not.

264 X Q. The regulator described in the patent is not operative, is it?

A. I think not. It is little more than a suggestion, and in my opinion not a practical suggestion.

265 X Q. The system of conductors described does not have the feeders necessary for producing substantially equal pressure throughout the system, does it?

A. There is no systematic organization of the circuits, as shown in the drawings, for the purpose of securing uniform distribution, although such distribution would be largely secured by the interconnection of the conductors in the manner shown. The general principles of arranging each lamp so that it draws an independent portion of current from the central station, which does not pass through any other lamp, and the interconnection of the main wires to aid in the uniformity of distribution, are both plainly present in the diagram; but the interconnections are made in a haphazard way and not as the result of any orderly and systematic computation. I therefore consider that while the distribution in such a system would be fairly uniform, it would not be as much so as if it were systematically arranged, nor would it be done with so great an economy, either in first cost of conductor, or in subsequent working, as if — had been properly organized.

266 X Q. In the conclusion of your answer 196, you state:

"In view of these publications"

(which I understand you to mean the paper published in the Telegraphic Journal and Electrical Review, and the Lane-Fox English patent, No. 3988 of 1878).

"I cannot concur with Professors Barker and Brackett, in 2347 the opinion that the idea of making the incandescent conductor of very high resistance was first made known in the New York Herald article and in Mr. Edison's patents No. 233,898 and 227,229."

Is it not a fact that the article from the Telegraphic Journal and Electrical Review does not describe an incandescent conductor of very high resistance, and that the Lane Fox patent does not describe such a conductor which can be practically made and used?

A. It is true that the Telegraphic Journal article is general in its terms and only points out the desirability of high resistance in the consumption circuit, without attempting to inform us how it may be accomplished. The Lane Fox patent is more specific and points out the necessity and desirability of high resistance in incandescent lamps for multiple-arc circuits most explicitly, but does not inform us how to make a lamp which shall have a high resistance which can be practically or at least commercially, made and used.

267 X Q. Two other patents of Lane Fox have been referred to by Dr. Morton on behalf of complainant, namely, No. 4043 of 1878 and No. 4626 of 1878. The first patent describes the use of an incandescing conductor, "made of asbestos or similar non-conducting material saturated or impregnated with some refractory conducting material, such as carbon or iridium." The second patent No. 4626 describes an incandescent conductor of platinum-iridium alloy or of the impregnated asbestos. Have lamps of these kinds ever been practically made and used?

A. Not within my knowledge.

268 X Q. In what respects, if at all, do you desire to change the testimony given by you in making out the *prima facie* case for complainant?

A. I do not now recall anything that I wish to change or modify in said testimony, other than the answer to X Int. 130, which, as I have once before stated, was made under the misapprehension that there were only three claims in the original specification, the 2348 fourth one having been overlooked by me at the time of making the answer, because it was on the other side of the leaf. I have already explained this matter and will therefore not repeat the explanation.

269 X Q. What specific material named in the original specification itself do you consider is referred to by the fourth claim?

A. Carbonized paper and wood carbon.

270 X Q. If the material referred to by the fourth claim is the wood or paper of the specification, how can the fact that you overlooked the fourth claim change your opinion as to what is described in the specification?

A. In X Q. 130, I was asked as to what there would be in the original specification and claim, to indicate such and such things if all mention of paper were left out; the answer related to the specification and claim, which term I understand to include all the clauses of the claim, and what I now say is that my answer then would have been different if I had had the fourth claim under consideration, which I did not, because the fourth claim embraces an incandescent arc made of carbonized fibrous or textile material. The use of a textile material necessarily implies that it would be formed before carbonization and that it would possess other qualities which are essential and which give it its value for an incandescent conductor.

271 X Q. Then if you were asked over again question 130 with the words "and claim" omitted, so that you would be referred to the original specification and not to the claims at all, your answer to question 130 would be a correct answer to the question as amended?

A. So far as I can now see it would be.

272 X Q. In your answer to Q. 200 you agree with Prof. Cross and Dr. Morton, that the word charcoal has a certain technical meaning to electricians, different from its ordinary meaning. Does such technical meaning exist with practical electricians at the present time?

A. I do not think it can be said to. Within ten years the practical application of electricity has grown into an enormous in-
2349 dustry, and the technical terms employed in connection with
it have, of course, received well-defined meanings, which was not the case prior to that time, when the whole matter was rather a laboratory experiment than anything else.

273 X Q. When did you first learn that any confusion existed in the art with reference to the use of the word charcoal?

A. My attention was first particularly directed to it in the course of a careful examination of the patents and publications in evidence in this case. I have been aware for many years that the word charcoal was loosely used and applied to hard carbon, but I did not know the extent to which this misapplication of the term prevailed in the literature of the art until I came to examine it carefully.

274 X Q. It did not occur to you as a practical electrician that such a confusion existed in the minds of electricians at the time you gave your testimony in the *prima facie* case?

A. I was aware at that time that the term charcoal was more or less used in patents and in text books when the thing actually meant was hard carbon; but I did not know that the use of the word with that meaning had been common. It has not been common among practical electricians since arc lighting came into ordinary use.

275 X Q. What is the date referred to in your last answer?

A. No exact date; say about 1878.

276 X Q. Is it not a fact that in many of the publications which have been referred to by yourself and the other experts for the *the* complainant, the text itself does not show that word charcoal has

other than its ordinary meaning, but that you and the other experts infer that it refers to gas-retort carbon, because you believe gas-retort carbon or other forms of hard carbon completely superseded the use of wood charcoal or wood carbon, for the production of the arc light?

A. I have made that inference in some, at least, of the publications cited, and I think myself warranted in doing so, for the reason that so far as I have been able to discover there is no instance on record in which an arc lamp having an automatic or self-operating feeding mechanism has been supplied with anything but electrodes of gas carbon, either cut out of the solid mass or moulded and baked.

277 X Q. Is it not a fact that gas carbon is exceedingly difficult to work?

A. It is.

278 X Q. And it does not produce so brilliant an arc light as one formed from wood-carbon points?

A. I do not know how that would be, but I should expect to find that the softer-wood carbon gave the more brilliant illumination.

279 X Q. Is it not a fact that down to the date of commercial arc lamps, which you fix at about 1878, the arc light was frequently produced as a lecture-room experiment and for popular illustration, by means of simple apparatus similar to that shown by figure 2, of Dr. Morton's lecture upon the electric light, and that on account of the difficulty of working gas carbon, wood-carbon points were frequently used for the purpose?

A. I do not think that they were used to any great extent, if at all, so recently as that, but still they may have been. Hard-carbon pencils have been regular articles of manufacture in France since 1845 or 1850, and they began to be made in this country at least as early as 1859, so that I should suppose, as the hard carbons are much the most convenient and could be obtained without much difficulty that wood carbon would hardly have been used after 1859 or 1860.

280 X Q. Under the head of "Electric Light," in the work on "Electricity," by Robert M. Ferguson, Ph. D., F. R. S. E., of the Edinburgh Institution, published in London in 1873, occurs the following statement: "The various forms of carbon are well suited to this purpose; the more compact forms of charcoal answer very well; baked carbon (85) answers better; but the coke that is sublimed inside of the retorts in the distillation of gas, both for durability and conducting powers, makes by far the best poles. What is meant by the expression "compact forms of charcoal" in this quotation?

A. The natural inference from the context would be, I think, that it meant wood charcoal made of hard and compact wood, boxwood, for instance.

281 X Q. This statement also indicates, does it not, that wood carbon was in 1873 in Dr. Ferguson's opinion, at least, suitable material for exhibiting the electric light?

A. Yes, although he expressly says that it is the least suitable of the various forms of carbon which were then known to be applicable to the purpose.

282 X Q. In the extract you have quoted from Pynchon's Chemical Physics, what material do you think is referred to by the words "well-burned charcoal"?

A. Apparently wood carbon.

283 X Q. Referring to Sawyer and Man's patent, 211,262, which describes what has been called the hydrocarbon treating process, does not this patent indicate a clear preference on the part of Sawyer and Man for use in incandescent lamps of exceedingly hard dense carbon?

A. A statement occurs in the specification to the effect that pencils of carbon which have been moulded and baked are not sufficiently hard and dense, and the patent describes a process by which the exterior of such carbons is increased in hardness and density. Accurately speaking, I should say that the patent indicated a preference for carbons having a hard dense exterior.

284 X Q. Does not the patent refer to the two kinds of carbon used for arc lamps, namely, gas-retort carbon and moulded carbon, and then state that neither of these is suitable for lighting by incandescence, because there is a lack of homogeneity, and the pencil is not sufficiently hard and dense?

A. Yes, that is the substance of the statement.

2352 285 X Q. And do you not gather from the patent that it was the notion of the patentees that a carbon harder and more dense than gas-retort carbon, was the proper kind of carbon for lighting by incandescence?

A. It is perhaps possible to infer from the statement of the patentees that such was their notion, but the process which they describe is stated to deposit a perfectly homogeneous layer upon the external surface. There is no doubt that this increases the hardness and density of the surface, but the general tenor of the specification seems to be that the principal object sought for is to obtain homogeneity and that the hardness and density are incidental to this.

286 X Q. I call your attention to a publication in the New York Tribune of January 2, 1880, which purports to be an interview with W. E. Sawyer, and is as follows:—

Mr. Sawyer Skeptical.

His views in regard to the practicability of the new Edison lamp.

Mr. W. E. Sawyer, of No. 78 Walker street, in this city, who has made long and careful researches into the problem of the electric lamp, was found at his office yesterday busily engaged in the perfection of a new invention designed for illumination. He is very much interested in the new claims of Mr. Edison and was quite willing to express his opinion in regard thereto. He said:—

"The public has received from Menlo Park the following positive assertions. (1) That Mr. Edison's new lamp consists of a horseshoe of carbon about two and a half inches long, clamped in

platinum holders and hermetically sealed in a glass globe from which the air has been exhausted. (2) That the horseshoe consisting of carbonized bristol-board is so tough and flexible that it can be twisted nearly half way round without breaking. (3) That the horseshoe of carbon, no oxygen being present in globe, will last an ordinary lifetime; that it has already been run over 100 hours
without suffering deterioration. (4) That the light from
2353 each lamp is about equal to an ordinary gas-jet, or say ten
or twelve candles. (5) That no dynamo machine known
can generate sufficient electricity to destroy one of Mr. Edison's horseshoes. (6) That the chief point of advantage in the new lamp is the high resistance—140 ohms. There are other statements, but the foregoing cover the ground pretty thoroughly. Having during the past three years made the most complete series of experiments respecting electric lighting by incandescence that have probably ever been made, I am enabled to speak positively about many points that to those unfamiliar, or only partially familiar with the subject may seem uncertain, or else correct, when entirely wrong."

"First then" asked the reporter, "what is your idea about the use of platinum for conducting wires?"

"The use of platinum as a holder for the incandescent carbon conductor" replied Mr. Sawyer, "is fatal to the durability of a lamp. Carbon only, of larger section than the incandescent carbon can be employed, for the reason that at a white heat the carbon combines with the platinum to form the platinic carbide and disintegration takes places with great rapidity. The same is true of any metal. I have welded carbon pencils in all shapes, and the best way to establish the connection of the incandescent carbon with its holder is to weld the two together. This I have done by first clamping the horseshoe in carbon-holders, then inverting the lamp and immersing horseshoe and holder in any hydrocarbon, preferably pure olive oil; finally turning on a torrent of electricity so that the horseshoe is made intensely incandescent. With great violence the oil is decomposed the hydrogen escaping and the carbon being deposited most rapidly at the points of contact of the horseshoe and its holders, the weld is so perfect that the horseshoe will break anywhere else rather than at the joints.

"Mr. Edison's paper carbon is very much longer than yours, Mr. Sawyer?"

"Yes; and when a length of incandescent conductor of
2354 one-half inch is reached the current can no longer be econom-
ically used because to increase the radiating surface, and the
short carbon can be made to give all the light desired, viz., from 25 to 250 candles."

"What do you think of the kind of carbon which Mr. Edison employs?"

"The denser, harder and more homogeneous the *the* carbon the tougher it is and the more durable the lamp for the reason that the whole action of the current (that very action which produces light, an intense vibration of the atoms or molecules of *of* the carbon amounting to several hundred millions of vibrations per second) is

to disrupt and disintegrate the carbon. The carbon formed by the process discovered in my experiments is the only one thus far that offers hope of permanency—a fine pencil of carbon being immersed in olive oil or any hydrocarbon gas or liquid and electrically heated as in the process of welding before described, whereby it is built up with carbon so hard and homogeneous that it may be polished like jet. As we descend from this we get less durable material, the order of durability being, *a* carbon deposited by electric action; *b* the hardest retort carbon, *c* the best artificial carbon, *d* hard coke, *e* dense charcoal (charcoal impregnated with syrup and the syrup carbonized), *f* willow, paper and other fine charcoal, *g* ordinary charcoal, *h* graphite. Mr. Edison's carbon belongs to the class *e* or *f*, and as carbon in all its forms is exceedingly brittle, his statement that his paper carbon is so tough and flexible that it can be twisted half way round, etc., without breaking, is open to criticism. The best carbon of the charcoal order we have produced by impregnating with syrup the finest French willow charcoal used by artists and carbonizing the same, repeating this process a sufficient number of times. This is substantially the process of Peyret and of Gaudoin. In pencils of one-eighth in diameter and one-half in length, with perfect carbon connections, and in an atmosphere of pure nitrogen, not even the 100,000,000 of oxygen being present, these carbons will last as follows under the action of the electric current: *a* at red heat
giving a light of perhaps ½ of a candle, 100 to 200 hours; *b*,
2355 at between a red and a white heat, giving a light of 1 or two
candles, 20 hours; *c*, at a white heat, light 4 candles, 5 hours;
d, at true carbon incandescence, when the pencil has the limpid appearance of the sun to and gives a light of 25 or 30 to 250 candles, 2 to 5 minutes, or even less than 1 minute, disintegration occurring very rapidly, but no consumption taking place. The smaller the section of the pencil the shorter its life. The larger the pencil the more current required. The longer the pencil the more current required."

"Do you think the horseshoe lamps are liable to be injured by an accidental and sudden increase in the strength of the current?"

"When a carbon is in high state of incandescence," replied Mr. Sawyer, "double the current invariably ruptures or disintegrates the carbon. If Mr. Edison will only bring the current necessary for ten of his lamps, suddenly into one of them he will be surprised at the beautiful manner in which it will disappear. Experience has demonstrated that within reasonable bounds the less the resistance of an electrical circuit—which includes the resistance of the wires, of the machine and that of the lamps outside of it—the less the power required for effective work. The arrangement of Mr. Edison's lamps in multiple circuit, so as to lessen the external resistance where a large number of lamps are to be run, is hazardous. In running 2,500 lamps by a single generator, the mean will be found in a square of fifty in series and fifty in multiple. This would make the external resistance of Mr. Edison's circuit 140 ohms, requiring an intensity of current that would give violent shocks to those who might by accident touch the conductors, and a most costly insulation of the main wires. To place less of the lamps in series and more in multiple is as hazardous as to go the other way, inasmuch as it would increase the chances of a short circuit extinguishing lamps in other series. No lamps can be practical unless of low resistance."

Does not this publication contain the statement tending to confirm the idea contained in the Sawyer & Man patent No. 2356 211,262, that hard, dense carbon, similar to gas carbon and deposited carbon, is better for incandescent lighting than soft carbon such as would be made from paper or wood?

Objected to as incompetent, hearsay, irrelevant, immaterial, not subject of cross-examination, and motion will be made to strike out the newspaper account of the alleged interview, at the hearing.

A. Yes, I think the statements made in the article referred to as coming from Sawyer tend to support that opinion.

287 X Q. What is the process described and claimed in the Sawyer & Man patent No. 211,252, with regard to the character of the hydrocarbon from which the deposit is to be made?

A. The electrical heating of the carbon while immersed in a hydrocarbon liquid; the specification says that almost any hydrocarbon will answer.

288 X Q. Do you consider the electroplating process referred to near the top of the second column of the second page of the patent an operative one?

A. I am unable to say whether it is or not, I know nothing about it.

289 X Q. Have you ever heard of a process of this kind being practiced?

A. Not so far as I now recollect.

290 X Q. From your knowledge of electrolysis, do you consider it possible to deposit carbon in this manner?

A. My knowledge of electrolysis is not very extended nor complete, and I do not feel that it justifies me in expressing an opinion on this point.

291 X Q. In your answer to question 198, you disagree with defendant's experts in the opinion expressed by them that the lamp structure shown and described in the patent in suit would be unsuitable for practical use, and you think that it would be immeasurably superior to any of those which are described in prior patents and publications. You also express the opinion that an incandescent lamp may be made in accordance with the de- 2357 scription of the patent, which would have sufficiently long life to be of value for many practical purposes. How long a life do you think would be necessary to make the lamp of value for many practical purposes.

A. I can conceive of useful purposes to which the lamp might be adapted even if it did not last twenty hours, but speaking in the ordinary acceptation of the term, a lamp which would run 50 or 100 hours would have a considerable degree of utility.

292 X Q. Would a lamp which continued to burn not more than five minutes be of value for many practical purposes?

A. I should say not.

293 X Q. What connection, if any, did you have with the writing or publication of the book entitled "The Speaking Telephone, Electric Light and Other Recent Electrical Inventions," by George B. Prescott, published in New York in 1879, which I now hand you?

A. I had no connection whatever with the preparation or publication of the book, although it contains considerable matter which was written by me for other purposes, among which I recognize the portion from page 183 to 205, and 235 to 259 inclusive. All this matter relates to telephones and harmonic telegraphy. I also wrote the description of the Jablochkoff system, commencing with the bottom of page 481, and ending in the middle of page 495. I think this embraces all the matter in the book which I had anything to do with in any way.

294 X Q. Do you consider the book to be substantially reliable in its statements?

A. I think it is, as a general thing, although I cannot undertake to vouch for it in every particular. It is a compilation of the views and opinions of a good many different persons, and naturally some of them are more careful in their statements than others.

295 X Q. Is not the following statement made with reference to the Sawyer-Man lamp at page 510 of this book?

2358 "We have seen five or more of these lamps in operation at one time, and were much pleased with their performance. Our investigation of the various details connected with their construction and maintenance was, however, too limited to enable us to judge of them from an economical standpoint. One or two things which came under our observation did not impress us quite so favorably as we had reason to anticipate from what we had heard of them. Possibly a poor adaption of means to ends, which is so often noticeable with new and hastily introduced apparatus, is in part responsible for this, but it is certainly remarkable that the continuance of the light on the occasion of our visit was not prolonged beyond five minutes at the most; and this fact, taken in connection with the sound from the dynamo-electric machine, which indicated both a high rate of speed and the production of a powerful current, was not calculated to greatly astonish any one familiar with the subject of electric lighting."

Objected to as incompetent and immaterial.

A. Yes.

296 X Q. The lamps which you say you have examined in answer 199, were lamps lately built, were they not for the purposes of this case?

A. I understood that they were partly old lamps, originally made by Sawyer and Man, and partly new ones recently constructed; all the incandescent conductors being of recent make.

297 X Q. They are the lamps which have been testified about by the witnesses Packard, Shallenberger and Smith?

A. The same.

298 X Q. Is your opinion that the lamp structure of the Sawyer-Man lamp is immeasurably superior to any of those described in prior patents and publications, in harmony with the following statement, quoted from page 199 of Du Moncel on electric lighting trans-
lated by Routledge and published in London in 1882; the
2359 same being apparently a translation of the statement con-
tained in the original French publication published in Paris
in 1880 at page 226?

"Sawyer-Man's Lamp.—This lamp is nothing more than King's or Lodyguine's in all its simplicity, except some insignificant arrangements for lessening the calorific radiation, and we are surprised at the long accounts we read in the English journals about this lamp, which is probably not better than the older ones. In this system, the vessel containing the incandescent carbon is filled with nitrogen to avoid combustion and the deposition of volatile products on the surface of the vessel. The carbon itself is rather short; its resistance does not exceed 0.95 ohm, and each light is supplied with a derivation, in order that the conditions of the distribution of the current may not be changed when any one of the lamps is extinguished. The commutator used for lighting and extinguishing the lamp is, moreover, arranged in such a manner that the current gains its full intensity only by degrees, and after having passed through successively weaker resistances. It is, according to Sawyer-Man, from neglect of this precaution that the carbons of incandescent lamps are so soon spoiled. Finally, an electro-magnetic register is included in the circuit, and has the same effect as a gas meter."

"We shall not speak of the system of distributing the current among all those lamps, for it is founded on the principle of derivation, and is identical with that of Werdermann, which we shall presently consider. A detailed description of this lamp may, however, be seen in the Telegraphic Journal of 1st January, 1879. We think it unnecessary to say more about it, than to express our surprise that English and American inventors trouble themselves so little about the earlier inventions."

Objected to as incompetent and immaterial.

A. No, I do not altogether agree with the statement of the author of the extract.

299 X Q. I call your attention to a publication in the New York World of December 24, 1879, the same purporting to be a letter from W. E. Sawyer and being as follows:

2360 *Edison's Electric Light.*

Mr. Sawyer questions the novelty and the practical value of the discovery.

To the editor of the World:

SIR: My attack upon Mr. Edison in the Monday's Sun was provoked by his constant appropriations of the credit due to others, not that he never accomplished anything himself, for we know that he has done a great deal in the advancement of science. It does not follow because he has made some correct deductions that all he says must be correct; nor because he has made many failures that he is not, as I believe him to be, a mechanical genius. What I claim is that he is not what he professes to be, an electrician.

"The credit of electric lighting does not belong to any one man. Its present degree of perfection is due to the labors of a hundred experimenters as brilliant as Mr. Edison, and probably more so than I am. My own position in the matter is that which follows three years of study, and in that time I have taken out a dozen or fifteen patents on electric lighting alone, so that when Mr. Edison made his startling announcement fifteen months ago, he must have known from the printed records of the Patent Office, with which he never fails to provide himself, that what he claimed was not his own. His system of distribution, his means of regulating the current in his lamp, etc., had been fully covered by my patents. The very platinum lamp that was so noised about had been made a years before Edison's announcement of it, shown to everybody and cast aside as worthless by Mr. H. S. Maxim of this city. It was cast aside because platinum shortly disinte*rg*ates, and because it takes three horse power to produce the light of a first-class gas jet from it with the best machines known. Mr. Edison afterwards secured a patent upon it because Mr. Maxim had not considered it worth patenting himself.

"I would not dare to allege that Mr. Edison's scheme
2361 was not a genuine one; nor that it has been used to humbug
the people in subscribing to worthless interests; nor that the gasmen are at the bottom of the whole scheme, and mean to show by the failure of a gentleman popularly supposed to be supernatural, that no one else can ever accomplish anything to injure the gas interests. I simply point out the facts that the Sawyer-Man lamp and various improvements upon it, as fast as made, have been successful for more than a year, and that the brilliant lamps of other inventors are notoriously in practical use in our streets to-day, while all we have heard from Menlo Park is that Mr. Edison, a great and eccentric genius, who divides his time between eating herrings, wearing old hats, rolling tar abstractedly in his fingers, going without his dinner and finally founding his great achievement upon, as has always really been the case, cotton thread and paper.

"This does not prove, however, that Mr. Edison may not some day do something. I only allege that up to this time he has done absolutely nothing that is new or valuable in electric lighting, and I am prepared to stake my reputation as an electrician upon this statement.

"The immediate cause of my challenge to Mr. Edison was my information that friends of his saw in my laboratory months ago the identical horseshoe lamp that is set up as his latest and grandest achievement, and my belief that he could not have failed to know that it was my invention. I object decidedly to his claiming my invention as his own, especially when it seems clear that the object of the announcement was to raise money. Over a year ago I experimented with the horseshoe lamp, and found it a failure even with the carbon much harder and more tenacious than paper carbon. Some dozen of these lamps were constructed. The average life of the horseshoe was an hour. One of these lamps, with the horseshoe complete (except at the point where rupture occurred when the lamp broke down), is still hermetically sealed in its glass tube, and still charged with nitrogen just as it was taken from the bracket in January last. I handed it to Messrs. Arnoux 2362 and Hochhausen, 2 Howard street, yesterday morning at nine o'clock, in order that no loop-hole may be left for prestidigitation at Menlo Park. If this does not settle the question of priority, I don't know what will settle it. A further fact about the horseshoe lamp is that it is so complete a failure that we decided nearly a year ago it would be wasting money to spend thirty-five dollars for a patent upon it.

"The time has passed for any more electric light sensations. The only thing that can revive the subject is proof—practical demonstration, with the lamps kept out of the hands of those whose interest it may be to manipulate them. I accept the situation; I am more than anxious to try conclusions with Mr. Edison; I reiterate my challenge to him, and I don't propose that Mr. Edison shall escape the issue he has drawn upon himself.

"He says he proposes to exhibit his light at Menlo Park, next week. Next week I shall exhibit my light in New York in practical household use. The public can then judge for itself whether my system is a failure, and whether Mr. Edison has not been either himself deceived or persistently deceiving the community. Until then I shall have no 'more last words' on the subject."

Respectfully yours, W. E. SAWYER.

New York, December 23d.

Are the statements contained in this letter as follows:

"Over a year ago I experimented with a horseshoe lamp, and found it a failure even with the carbon much harder and more tenacious than paper carbon. Some dozen of these lamps were constructed. The average life of the horseshoe was an hour. * * * A further fact about the horseshoe lamp is that it is so complete a failure that we decided nearly a year ago it would be wasting money to spend $35 for a patent upon it,"

in harmony with your opinion that the Sawyer and Man 2363 lamp would be immeasurably superior to those which preceded it?

Objected to as incompetent and immaterial.

A. My statement as to the superiority of the Sawyer and Man lamp referred to in this question was intended to apply to the lamp structure, as the question shows. The quotations from Mr. Sawyer's letter relate to a certain horseshoe carbon, which I judge from his description was a hard carbon, although he does not state expressly what it was. The fact that the life of the horseshoe was only an hour is not necessarily due to defects in the lamp structure, for a defective carbon will often give way soon after the current is turned on, even in the most perfect lamp structures known in the art at the present day; hence I do not see anything in Mr. Sawyer's statements in the above letter which necessarily conflict with the opinion I expressed with reference to the lamp structure.

300 X Q. If the lamp structure were defective, the life of the carbon would be shortened, would it not?

A. Certainly.

301 X Q. Does not the statement contained in this letter, that the horseshoe lamp was found to be a failure, "even with the carbon much harder and more tenacious than paper carbon," show a preference in Sawyer's mind for the harder carbon as being a more perfect carbon?

A. Yes, I think that inference may be drawn from the language.

302 X Q. Do you agree with Professor Cross in the definition he gives of an arc incandescent lamp in his answer to 97 X Q. of his deposition in this case?

A. Yes.

303 X Q. Does not the lamp described and shown in the Sawyer and Man patent No. 205,144, come within Professor Cross's definition of what constitutes an arc incandescent lamp?

A. I should say that it did.

2364 304 X Q. Would not a lamp having a burner constructed of two pieces of carbon with their lower ends secured to their respective supports, and having their upper ends brought together so as to form an inverted-V-shaped burner, be an arc incandescent lamp?

A. If the light were produced, as I understand from your description it would be, at the point of mechanical contact between the two carbons, then it might properly be regarded as an arc incandescent lamp. It would fall within the definition of Professor Cross, which seems to me to be an accurate one.

306 X Q. If the pieces were simply brought together into surface contact, without being so perfectly united by a connecting clamp as to convey the current from one to the other without arcing, then the lamp would operate upon the arc incandescent principle, would it not?

A. Yes, I think it would fall within that class.

306 X Q. Referring to the description of the V-shaped burner contained in the patent in suit, beginning at line 78 second column first page. Is there anything contained in this statement of the patent which necessarily excludes the idea that a lamp working on the arc incandescent principle is intended?

A. There is nothing in this specific statement which necessarily excludes that idea, but in the general statement of invention, the invention is said to relate more especially to the incandescing conductor, which implies a continuous conductor of greater or less length rendered uniformly incandescent. In speaking of the upper ends being united, the patentees may have referred to the process of uniting by hydrocarbon deposition described in one of their earlier patents, which would unite the conductor in such manner as to form one continuous conductor.

307 X Q. That is, the character of the union would probably determine the character of the lamp?

A. Yes, that is my idea of the matter.

2365 308 X Q. Where, in any earlier patent of Sawyer and Man, do you find any description of producing such a union by hydrocarbon deposition?

A. I was under the impression when I made the above answer that I saw this in one of the patents examined to-day; I now find this an error and that it is not described in any of the prior patents, so far as I can discover.

309 X Q. There is nothing to indicate by the language of the patent in suit itself, what the character of this union is to be?

A. No; it is entirely a matter of inference from the general statement of the invention.

Defendant, by its counsel, gives notice of record, that it wishes, without delay, and at the convenience of complainant's counsel, to call and examine John C. Tomlinson and Richard N. Dyer, referred to in the cross-examination by Mr. Griffin of the witness Church, for the purpose of impeaching the credibility of said witness, and as to the matters set forth in said cross-examination, more particularly the interviews between said Church and Messrs. Tomlinson and Dyer. Defendant requests that complainant consent to this examination, so as to avoid the otherwise necessary delay of a motion to the court for leave to so examine said Tomlinson and Dyer.

Adjourned subject to notice.

NEW YORK, *May 4th*, 1889.

Met pursuant to agreement.
Present, counsel as before.

Cross-examination of F. L. POPE continued:

310 X Q. I call your attention to the following extracts from English and other periodicals:

Extract from a paper entitled "The Electric Light. By W. H. Preece, memb. Inst. C. E., V. P. Soc. T. E., electrician general post office, &c." Philosophical Magazine, vol. 7, page 29, 1879.

2366 After discussing the mathematical theory of the electric light as applied to light by incandescence, and to the electric arc, the paper concludes:

"We have assumed W′ to be constant; but this is only the case when a certain limit is reached, and when the velocity of the rotating coils in the dynamo machine has attained a maximum. This limit will vary with each dynamo machine and each kind of lamp used. With the Wallace-Farmer machine, the limit appears to be reached when six lamps are connected up in series. With the Gramme alternating machine and the Jablochkoff candles, the limit appears to be five lamps. Beyond these limits the above laws will be true. It is this partial success in multiplying the light, that has led so many sanguine experimenters to anticipate the ultimate possibility of its extensive subdivision—a possibility which this demonstration shows to be hopeless, and which experiment has proved to be fallacious.'

Also the following extracts from a lecture delivered by Preece, at the United Service institute, on the electric light, and published in The Electrician for February 22, 1879.

"It is, however, easily shown that in a circuit where the electromotive force is constant, and we insert additional lamps, then when these lamps are joined up in one circuit, *i. e.*, in series, the light varies inversely as the square of the number of lamps in circuit, and when joined up as in multiple arc, the light diminishes as the cube of the number in circuit. Hence the subdivision of the light is an absolute *ignis-fatuus*.

Also the following extract from a lecture delivered by John Tyndall, before the Royal institution, on the electric light, and published in the New York Times for February 16, 1879:

After describing what he understands to be Mr. Edison's system, Mr. Tyndall states:

"Knowing something of the intricacy of the practical problem, I should certainly prefer seeing it in Mr. Edison's hands to having it in mine."

2367 I call your attention also to a report on the electric light at Westgate-on-Sea, signed by W. H. Bennett and William A. Valon, dated June 17, 1879, 22 Great George street, Westminster, S. W.; wherein among other things it is stated:

"The liability of the machinery to derangement at any moment, the defective character of the candles, the incessant variation of the illuminating power, want of diffusibility and means of storage, the constant care and attention the lights require, and the enormous cost of producing the light, all unfit it for a general public illuminating agent. We have seen all the systems that have been introduced in the last eighteen months, and we have no hesitation in speaking that if electricity is to be the light of the future, it must be produced by a radically different system to any yet brought before the public, a system, in *your* opinion, that remains undiscovered."

Also the following extract from lectures delivered by Dr. Redwood in the theatre of the Pharmac*eu*tical Society, Bloomsbury square, and published in the Iron for February 3, 1879. After referring to his lecture delivered thirty years before in the same institution, in which he had pronounced the electric light impracticable, he states:

"What new laws have been discovered to render that practicable now which was pronounced impracticable thirty years ago, he was not aware of any such discovery having been made."

Also the following extract from an article on "The Brush Electric Light," from the Engineering of January 2, 1880:

"More than a year has passed by since the scientific world was startled, and a panic struck into the breasts of the gas companies

by the cablegram announcing that Mr. Edison had solved the problem of the divisibility of the electric light and that he would speedily supply such light to all households at a cost far below that of gas. Enthusiasts in his rare and inventive faculty were disposed to believe this announcement; but more prudent critics throw doubts upon its reliability; as time went on without
2368 bringing with it the promised lamp the public at large began to be skeptical of the alleged discovery; and even the sanguine confidence of Mr. Edison himself and the highly colored reports of Yankee correspondence, could not shake the opinion which gradually gained ground that he had discounted success."

Also an extract from an article in the Engineering of April 16, 1880:

"The grand idea of the divisibility and distribution of electricity in the same manner as gas or water, viz., having large leading wires or mains running through the principal streets with small branches for each consumer—has not for a moment been entertained by any of the electricians, though this is the plan the anxious public are waiting for; the reason being that you cannot have storage for your supply as with gas. * * *

Now, as it is impossible to store electricity in any appreciable quantities, we say the object must be to utilize its power as it is being generated; therefore the greatest difficulty is in the distribution as produced."

Also the following extract from an article in Engineering, volume 29, page 113. After referring to the excuses which the article states had been advanced for delaying the introduction of Mr. Edison's system into public use, it proceeds:

"However, this may be, the public will be glad when the real practical trial comes off and reveals how each of these glowing anticipations are destined to failure or fulfillment. And although there is in all this nothing new in favor of Mr. Edison's wilful choice of an incandescent light, to which he obstinately adheres, we cannot help admiring his ceaseless perseverance in developing the system which he has adopted for better or for worse as his own."

Also the following extract in an article in Engineering for February 21, 1879, p. 161:

"Whether Mr. Edison's system for utilizing electric current can only be satisfactorily demonstrated by actual experiment and
2369 experience, it will be severely handicapped against all electric arc systems by the visible drawback common to all incandescent systems, namely, that for each addition to the number of lights in circuit an enormous reduction is made in the intensity of the light produced. We therefore cannot but believe that we have not yet seen the system by which Mr. Edison states in his more recent letters to this country that he is able to place 678 electric lamps in one circuit."

Also the following extract from a letter written by Silvanus P. Thompson and published in the Engineering for December 27, 1878, p. 517:

"Any system of lighting depending upon incandescence will utterly fail from an economic point of view, and will be the more uneconomical the more the light is subdivided."

Also the following from the Engineering for February 13, 1880, p. 136, the same being a criticism of Mr. Upton's article on Mr. Edison's light published in Scribner's for February, 1880:

"Either as we have said, Mr. Edison and Mr. Upton know little or nothing of electric light, or else they have put forward statements which are in advance of fact and that knowingly and of set purpose. * * * But he understands so little the questions involved in the production of the electric light that he has failed to see the controversies which must ensue from the fact that if the resistances be increased, the power must be increased also."

After referring to specific statements contained in the Upton article the Engineering continues:

"Thus at every turn, the moment Mr. Upton's statements are submitted to the test of calculation, they break down, or appear in the light of wild vaticinations, hardly deserving serious attention."

Also the following extract upon an article on the electric light published in the Engineering for January 10, 1879, p. 30:

2370 "Electricians who are not commercially interested in any form of electric lamp or machine, show that this subdivision could only be effected at an enormous expense for light and material, owing to causes which we need not stop to explain * * * Before the electric light can be subdivided with facility and economy, the operation of some new law must be discovered, and this we hold to be extremely improbable."

Also the following extracts from an article on the Edison electric light published in the Engineering for February 14, 1879, pages 113 and 114:

"All anxiety concerning the Edison light may be put on one side. It is certainly not going to take the place of gas * * * Mr. Edison will no doubt attain much success at Menlo Park where everything will be under his control; but for the ordinary purposes of lighting our houses, the electric lamp is probably yet to be invented. If the current can be successfully divided among dozens of lamps, then the gas-makers quake; but nothing of the kind can be done."

Also the following extract from an article in the Engineering for December 26, 1879, p. 470 entitled "Mr. Edison's Ultimatum:"

"Heated paper is an impure charcoal, and Mr. Edison might just as well use a charcoal from a willow switch as that from his paper horseshoe. Carbon in all its forms has been tried over and over again, and electricians know precisely what can and what cannot be done with it."

Also the following extract from an article by Weisendanger, published in the English Mechanic for February, 1880. Speaking of Edison's light, the article says:

"With our present means and methods of producing the electric current and the knowledge we now possess of utilizing the same, subdivision entails an enormous loss of light. The new Edison light—a vision—a terror to the timid holders of gas shares, a phantom of mischief to ignorant speculators—is such a short-lived incandescent system, a baby, harmless indeed though not innocent, if compared to the giant systems of Siemens, Brush and Gramme."

2371 Do not the foregoing publications form a reasonable basis for the statement made by Mr. Edison and which you have quoted and criticised in answer to Q. 193, with regard to the scientific opinion in 1879 as to the practicability of subdividing the electric light?

Objected to as irrelevant and immaterial.

A. In a general way perhaps this may be the case, but nevertheless I think that the extracts you have cited agree very well in the main with my own statements with reference to the matter. Mr. Preece, whose adverse testimony before the parliamentary committee was quoted by me, placed himself on record many times with the positive assertion that the subdivision of the electric light was an impossibility. At that date Mr. Preece was an experienced telegraph engineer, but it is easy to see that his knowledge of electrical science in its broadest sense could not have been very profound.

The extract given from Mr. Tyndall's lecture is the one which I had in mind in making my answer, when I said he had made substantially the statement attributed to him by Mr. Edison.

Bennett, Valon and Redwood cannot be considered as representative electricians; in fact I don't remember to have ever heard their names before.

Professor Sylvanus Thompson is now considered a very good authority; at that time he was a young man and comparatively unknown.

The various articles quoted from Engineering were the work of some anonymous newspaper writer of the class to which I referred who "create an amount of noise out of all proportion to their real importance." I think it is very probable that the majority of the opinions which were brought to Mr. Edison's notice, which would naturally be those of the journals and publications referred to, may have been such as to have afforded him a basis for his statement; at the same time, I do not think that the authorities thus referred to properly constitute "scientific opinion."

2372 311 X Q. Is not the Engineering a leading English technical journal and was it not such in 1879?

A. It has always been considered excellent authority on matters of engineering and in fact of general science, so far as relates to its own field. The articles relating to electrical subjects at the time now under consideration, were generally understood to be written by Conrad W. Cooke, a civil engineer, but not in any way prominent as an electrician, either at that time or since. Nevertheless I have no doubt that in the minds of the majority of people, Engineering would have been considered good authority upon any subject upon which it undertook to treat.

312 X Q. Was Mr. Cook one of the persons whom you referred to as creating an amount of noise out of proportion to their real importance?

A. Yes, I think that is true to a considerable extent. He appears to have been better informed than many who wrote upon the subject, but not so well as he ought to have been for the position he undertook to fill.

313 X Q. Under the head of notes, in the Telegraphic Journal, February 1, 1879, appears the following:

"American electric lights.—A leading American electrician writes as follows: 'I know of no one here (whose opinion is worth anything), who has any confidence in the practical success of Edison's scheme. The way that the world stands agape waiting for the Edisonian mountain to bring forth its mouse is really absurd. I think you will be safe in not taking much stock in the greatly bepuffed electric light inventions of which the American newspapers are full. I have seen nothing yet as far advanced as what I saw at the Paris exposition.'"

Who is the leading electrician referred to in this extract if you know?

A. The person referred to is probably myself. Although I do not set myself up as a leading electrician. I recognize the extract as
containing the substance, though not the words, of a private
2373 letter which I wrote at that time to a friend in London, not
connected with any journal, so far as I know.

314 X Q. I call your attention to the U. S. patent of J. W. Swan on electric lamps, No. 233,445, dated October 19, 1880, in which appears the following statement:

"The second part of my invention has for its object to prevent the rupture of the carbon within the exhausted glass bulb, as the results of its unequal contraction.

"I have found that when the carbon employed within the lamp is formed of a horseshoe-shaped plate, produced by cutting out the horseshoe-shaped piece from a sheet of cardboard, and afterwards carbonizing it by heat, the horseshoe-shaped carbon plate so produced is liable to become distorted and ultimately to break, in consequence of the unequal contraction caused by the unequal heating of the inner and outer portions of the arch during the use of the lamp."

Do you agree with the statement made by Mr. Swan in this patent?

A. I differ with him to this extent, that the objections set forth by him are not necessarily inherent in a paper carbon cut out in the manner described. My opinion is that the objection is largely, if not wholly a theoretical one.

315 X Q. Whether the objection is an important one or not, depends upon the amount of difference in length between the inner and outer edges of the arch or horseshoe, does it not?

A. I should say it depended upon the effect it had upon the life of the lamp. The difference in length between the inside and the outside of the horseshoe might have no material effect, either upon the life or the efficiency of the lamp.

316 X Q. The unequal contraction and expansion will be greater

the greater the difference in the length between the inner and outer edges of the arch or horseshoe?

A. Undoubtedly.

317 X Q. Who is the patentee, J. W. Swan, and do you 2374 consider him a person of practical experience in incandescence lighting?

A. He is an English inventor of incandescent lamps. I should say that he had had a very extensive experience, experimental and otherwise, in incandescent electric lamps.

Defendant's counsel offers in evidence the extract from Ferguson's work on electricity, published in London in 1873, and the same is marked Defendant's Exhibit Extract from Ferguson's Electricity. Defendant's counsel also offers in evidence the publication in the New York Tribune of January 2, 1880, purporting to be an interview with W. E. Sawyer, and the same is filed in evidence and marked Defendant's Sawyer Tribune Interview, January 2, 1880.

Objected to as incompetent and immaterial.

Also, the extract from Prescott's book on The Speaking Telephone, Electric Light and Other Recent Inventions, published in New York, in 1879, and referred to in X Q. 295, and the same is marked Defendant's Exhibit Extract from Prescott's Book.

Also, the extract from Du Moncel on electric lighting, published in London in 1882, entitled "Sawyer-Man's Lamp" and referred to in cross-question 298, and the same is marked Defendant's Exhibit Extract from Du Moncel's Electric Lighting.

Also, a copy of the publication in the New York World of December 24, 1879, purporting to be a letter from W. E. Sawyer, and referred to in cross-question 299, and the same is marked Defendant's Exhibit, Sawyer's World Letter of December 24, 1879.

Objected to as incompetent and immaterial.

Also, an extract from a paper entitled The Electric Light, by W. H. Preece, published in the Philosophical Magazine, volume 7, page 29, 1879, and the same is filed in evidence and marked Defendant's Exhibit, Preece's Philosophical Magazine Article.

Also, an extract from a lecture delivered by Preece at the United Service institute on the electric light, published in the Elec- 2375 trician, February 22, 1879, and the same is filed in evidence and marked Defendant's Exhibit, Preece Electrician Extract.

Also, an extract from a lecture delivered by John Tyndall before the Royal institution on the electric light, published in the New York Times, February 16, 1879, and the same is filed in evidence and marked Defendant's Exhibit Tyndall Extract, February 16, 1879.

Also, report on the electric light by W. H. Bennett and William A. Valon, January 17, 1879, and the same is filed in evidence and marked Defendant's Exhibit Bennett and Valon Report.

Also, extract from a lecture by Dr. Redwood, published in the

Iron, February 3, 1879, and the same is filed in evidence and marked Defendant's Exhibit Redwood Extract.

Also, an extract from an article, on the electric light, from the Engineering, of January 2, 1880.

Also, an extract from an article from Engineering of April 16, 1880.

Also, an extract from an article in Engineering, volume 29, page 113.

Also, an extract from an article in Engineering, February 21, 1879, page 161.

Also, an extract from Engineering, February 13, 1880, page 136.

Also, an extract from an article on the electric light published in the Engineering, January 10, 1879.

Also, an extract from an article on the Edison electric light published in Engineering, February 14, 1879, pages 113 and 114.

Also, an extract from an article published in Engineering, December 26, 1879, and the same are all filed in evidence and respectively marked, Defendant's Exhibits Engineering Extracts, No. 1, 2, 3, 4, 5, 6, 7, and 8.

Also, extract from a letter written by Silvanus P. Thompson, published in Engineering, December 27, 1878, page 517. The same is filed in evidence and marked Defendant's Exhibit Thompson Extract.

2376 Also, an extract from an article by Weisendanger, published in the English Mechanics for February, 1880, the same is filed in evidence and marked Defendant's Exhibit Weisendanger English Mechanic Extract.

Also, an extract from the Telegraphic Journal, February 1, 1879, on "American electric lights," and the same is filed in evidence and marked Defendant's Exhibit Telegraphic Journal Extract.

Also, copy of U. S. letters patent of J. W. Swan, No. 233,445, and the same is filed in evidence, and marked Defendant's Exhibit Swan Patent.

Complainant's counsel admits that the various publications and papers referred to were published and circulated at the dates mentioned, and consents that copies of the original publications or documents may be used in place of the originals, subject to the correction of any errors that may be found therein, and subject to objections to incompetency and immateriality.

Complainant's counsel objects to all of the above exhibits as incompetent, irrelevant, and immaterial.

NEW YORK, *May* 6, 1889.—2.30 p. m.

Met pursuant to agreement.
Present: Counsel as before.

Redirect examination by Mr. CURTIS:

318 R. D. Q. In the quotation from the Telegraphic Journal contained in X Q. 313, which you say you recognize as containing the substance, although not the words of a private letter written by you, reference is made to general lack of confidence in the practical suc-

cess of Edison's scheme; to what scheme did you refer, and in the light of present knowledge, would you desire to express any different opinion in regard to the probable success of a system of lighting like that to which you then referred?

2377 A. I am at the present time perfectly satisfied of the justice of the opinion which I expressed in the letter from which the publication purports to be a quotation. In justice to myself, I ought to state that the letter was written in answer to an inquiry from a party in England who proposed to interest himself in the matter, and who asked me for a candid opinion. While the manner of expression is not such as I should have chosen, had I supposed that the letter was to be made public; nevertheless the substance of it embodies my opinion, and I think is a true statement as to the opinion of others. The scheme referred to was that upon which Edison was engaged in the early part of 1879, and comprised lamps of incandescent platinum, such as those shown in figures 1 and 2 of the article in the New York Herald in evidence herein, in which each lamp was designed to be controlled by a thermostatic regulator. I was at that time entirely familiar with the work which had been done by Professor Moses G. Farmer some years earlier, and with his apparatus in which he had placed some 30 or 40 incandescent lamps of platinum wire in multiple arc with a dynamo-electric machine, the system being provided with an automatic regulator common to the whole system, for regulating the current at its source. I knew that the "scheme upon which Mr. Edison was then engaged was much less practical than that of Professor Farmer, for the reason that although he employed the multiple-arc distribution as Farmer had done, he combined with it the impractical idea of an automatic regulator at each burner. The justice of my criticism is, I think, shown by the fact that within a year Mr. Edison completely and definitely abandoned the entire scheme upon which he was then at work as commercially impracticable, with the exception of the general idea of distribution in multiple arc, which in itself, as I then supposed, and as I now believe, formed no part of his invention.

319 R. D. Q. Please examine British letters patent No.
2378 4705, dated Nov. 19, 1878, to Frederick John Cheesbrough, a communication by William Edward Sawyer of New York, and Albon Man of Brooklyn, and state whether or not in the automatic regulating apparatus there described, any of the defects referred to in X Q.'s 226 to 231, inclusive, and your answers thereto, including the quotations from your testimony in the suit on the Farmer patent.

A. I am familiar with the patent referred to, and in my opinion the apparatus described therein, although embodying the same general principle, is wholly different in the details of its construction from the one to which my testimony in the Farmer case had reference, and is free from the defects which appertain to the latter. I think the Cheesbrough patent describes beyond question an operative and practical apparatus, if constructed with ordinary mechanical skill.

Complainant's counsel offers in evidence a Blue Book copy of the British patent No. 4705, of 1878, referred to, and the same is marked "Complainant's Exhibit Sawyer and Man British Patent 4705, of 1878."

Defendant's counsel consents that a typewriter copy may be used in place of the Blue Book, which forms part of a bound volume.

320 R. D. Q. I notice that X Q.'s 237 to 243 inclusive, referring to Mr. Edison's patents No. 264,692 and No. 266,693 and No. 369,280 for feeders, feeder regulators and connecting dynamo machines in multiple arc, are confined to systems of electric lighting employing direct currents and covering large areas. Is there any system for central-station lighting in use which does not employ direct currents, and if so, how largely is it used?

A. Another system differing very materially from that known as the direct distribution is in very extensive use at the present day, and is called the alternating system. It does not employ feeders for distribution over large areas, nor are the dynamos placed in multiple arc. This is the system employed by the Westinghouse Electric Company, lessee of the complainant company, 2379 and also by the Thomson-Houston, Fort Wayne and Jenny and United States Electric Lighting Companies, for central-station work. I suppose there are nearly, if not quite as many central-station lights now in operation in this country on the alternating, as there are on the direct systems. Two of the largest stations in the world now being erected in London both make use of the alternating system; and of the central stations erected during the past two years in this country, the greater portion have been fitted up on the alternating system.

321 R. D. Q. Are you familiar with the apparatus used by the complainant and the Westinghouse Electric Company, in central station work for lighting large areas?

A. I am.

322 R. D. Q. Does either company employ feeders, or indicators for indicating the pressure at the outer ends of the feeders, or regulators for regulating the flow of current upon the feeders, feeder regulators, or connect its dynamos in multiple arc in such apparatus?

A. I think not; I have examined a number of the stations, among them some of the very largest ones, and so far as my observation went, nothing of the kind is employed. I am informed and believe that none of these devices are used in any of the plants referred to.

323 R. D. Q. Are these devices, or any of them, so far as you know, employed by other companies, in the alternating system?

A. I think not.

324 R. D. Q. Please describe briefly the difference between the alternating system and the direct system?

A. The essential difference between these two systems is in the manner of distribution. In the direct system, the electric current is produced and conveyed through the conductors, at a pressure differing but little from that at which it is utilized in the lamps. In the

alternating system, the electric current is produced and conveyed to the place where it is to be used, at a pressure usually twenty
2380 times as high as that required in the lamps. At the place of consumption a device known as a reducing converter is employed, which operates by the principle known as electric induction, to reduce the pressure of the current to a point corresponding with the requirements of the lamps. The reducing converter cannot conveniently be operated by a direct current, and this is the principal reason why the alternating current is used.

Now as the electric energy developed, or work done by any current, is the product of its pressure multiplied into its volume, and as the percentage of loss of energy in a given conductor from resistance or electrical friction is in proportion to the volume of the current, irrespective of its pressure, it is evident that a given percentage of a certain volume of current will involve a far smaller loss of energy at a high pressure than at a lower one. For this reason a percentage of loss in the volume of current which would be disastrous in a system of direct distribution, becomes a matter of comparatively little importance in an alternating system of this character, and the careful regulation of the pressure at all points of the system is unnecessary and may be dispensed with, without inconvenience or appreciable loss. For example, dynamos arranged in multiple arc, special feeder wires and feeder-regulator devices, are all dispensed with in the alternating system, in which the electrical pressure is from ten to twenty times as high in practice as in the direct system, while the volume of current is only from one-tenth to one-twentieth as great for the supply of an equal number of similar lamps.

325 R. D. Q. Who first introduced the alternating system into practical use, and about how long ago?

A. So far as I know it was first reduced to practice as a method of subdividing the electric light, as it was called, by Paul Jablochkoff in Paris. He showed it to me in experimental operation in his laboratory in that city one evening in July, 1878. I afterwards read of its having been exhibited by him in England, within a
2381 year from that time. He employed semi-incandescent lamps, as Professor Cross has called them, and used a pressure in his lamps equal to and sometimes in excess of that produced by the generator. In October, 1881, Messrs. Gaulard & Gibbs exhibited in London a system of this kind, in which modern incandescent lamps were employed and a reducing converter, enabling a high pressure to be used in the conductors and a low pressure in the lamps. This was installed on a large scale on the Metropolitan railway in the following year, and from this has been developed the system of distribution by alternating currents, which I have referred to as being in extensive use in this country and abroad.

326 R. D. Q. Who first introduced the system into this country?

A. The Westinghouse Electric Company. The United States patents of Messrs. Gaulard & Gibbs were purchased by myself in behalf of Mr. Westinghouse for the Westinghouse Electric Company in the early part of 1886, and the first central station plant was got into operation in this country before the close of the same year.

327 R. D. Q. Is it as important in the alternating system, as in the direct system, that lamps of very high resistance should be used, and as a matter of fact, what is the practice in that regard?

A. It is much less important in the alternating system, and as a matter of fact the most favorable results are found to be attained by the use in that system of lamps having a resistance less than half that which has proved to be most advantageous in the direct system of multiple-arc distribution.

328 R. D. Q. Referring to your answer to X Q. 240, was the connection of electric generators in multiple arc new in the art on February 5th, 1880, the date of the application for Mr. Edison's patent No. 369,280?

A. I think not. In the number of the Telegraphic Journal and Electrical Review of Nov. 29, 1884, is a reprint of a paper
2382 by Mr. H. Wilde of Manchester, England, which was originally published in the Philosophical Magazine, vol. 37, p. 54, and in the proceedings of the Literary and Philosophical Society of Manchester, vol. 7, p. 62, both published in 1869, in which is described in detail a series of experiments, in the course of which both direct-current dynamos and alternate-current dynamos were connected in multiple arc and applied to the work. The connection of batteries in multiple arc was a very well-known expedient at that date, having been very frequently employed in the telegraphic service.

Complainant's counsel offers in evidence an extract from the paper of H. Wilde referred to, published in the London, Edinburgh and Dublin Philosophical Magazine and Journal of Science at London in 1869, vol. 37, p. 54, and the same is marked "Complainant's Exhibit Extract from Philosophical Magazine."

329 R. D. Q. In your answer to cross-question 263, you say you do not think it would be feasible to make a high-resistance lamp of platinum-iridium wire for the incandescence portion, as described in the Lane-Fox English patent. In what sense would it not be feasible?

A. Purely in a commercial sense. A platinum lamp is an expensive means of producing light as compared with a carbon lamp, because it requires far more mechanical energy to bring it to the required degree of incandescence, while its life is uncertain, and at the best is comparatively short. I did not mean to be understood that under conditions in which economy is unimportant, it would be impracticable and without utility, because I do not think that such is the case.

N. Y., *May* 7, 1889—10.30 a. m.

330 R. D. Q. Taking into account the state of general electrical knowledge prior to 1880, and particularly the discussion of the Franklin institute test by Professors Thomson and Houston in the

article in the Telegraphic Journal and Electrical Review, to
2383 which you have referred, and the Lane-Fox English patents
in evidence, would it, in your opinion, require invention or involve any particular difficulty on the part of a person skilled in the art, to make the carbon conductor of the patent in suit long and thin, or, as defendant's counsel puts it in Q. 253 and 255, give the conductor the filamentary form described in Mr. Edison's patent, and so adapt the lamp for use in the first application set forth by you in your answer 196?

A. The law laid down by Professors Thompson and Houston was a general one, and pointed out the thing which needed to be done and the direction in which the inventor should work. The fact that high resistance is desirable and necessary in the individual lamps of a general system of multiple-arc distribution, is laid down most clearly in the patents of Lane-Fox, with a sufficient explanation of the reasons therefor. The one thing lacking in the organization of Lane-Fox to render it a commonly practical scheme, in the ordinary sense of the term, was a proper incandescent conductor. Lane-Fox ought to make a lamp of high resistance with a metallic incandescent conductor. Such a lamp could be worked to a limited extent in the multiple-arc system, and was not without a degree of utility, if nothing better had ever been found. In short it seems to me, that the patents of Lane-Fox describe a practicable and commercially useful system of incandescent lighting by multiple-arc distribution in every respect, except the material of his incandescent conductor. Hence it seems to me, that when a material had subsequently been discovered which was capable of withstanding a higher temperature in the lamp than the metallic conductor, and also capable of having any required form given to it in the process of its manufacture, no invention in the strict sense of the term, would be required to give to this the same properties which Lane-Fox had already given to the metallic conductor to as great an extent as that material was
capable of. Of course I do not mean to say that there might
2384 not have been room for invention in details of construction,
by which, I mean such things, for example, as particular methods of cutting, shaping and carbonizing or tempering the conductor, or enlarging it at the ends, or the like. I think, therefore, that a person skilled in the art and knowing how to prepare a carbon conductor, would not need to exercise invention in view of the knowledge contained in the Lane-Fox patent to make the conductor long and thin, as distinguished from short and thick, to any extent within the capacity of the material.

331 R. D. Q. Would it, in your opinion, be feasible, commercially, to make lamps of high resistance with conductors made of carbonized-tar putty, as described in Mr. Edison's patent No. 223,898, referred to in X Q. 251 and 255, and have lamps of that kind ever been practically made and used, so far as you know?

A. I do not think it would be commercially practicable in the ordinary sense. I think such a conductor might perhaps be made which would do some service. But it would be difficult, and the life of the lamp would be uncertain and probably short. I have no knowledge of any lamps having been practically used with incandescent conductors of this d*i*scription.

332 R. D. Q. In X Qs. 283 and 284 your attention was called to certain statements contained in the Sawyer and Man patent No. 211,262, in regard to the defects of ordinary carbons. Do you find any other defects of ordinary carbons referred to in this patent which the process there described was particularly intended to remedy?

A. The general defect which the inventors, according to their statement, were seeking to remedy is what they term "lack of homogen*ie*ty;" in explanation of which they say among other things, "that carbons of the ordinary sort, when heated by the electric current, exhibit points and lines of unequal brilliancy. Carbons prepared by our process, when so heated, glow with a uniform brilliancy throughout." I judge from the general tenor of the specification that this effect or result, that of unequal brilliancy,
2385 was the one which they were seeking more particularly to
avoid.

333 R. D. Q. In various ones of the publications referred to in X Q. 310, reference is made to a panic caused in English gas stocks by the announcement that Mr. Edison had invented a system of electric lighting, which would soon supply such light at a cost far below that of gas. When did this occur, and what system was referred to?

A. The panic referred to occurred in October and November, 1878, and the system referred to was that of platinum lamps with thermal regulators placed in the multiple-arc system of distribution, which was afterwards found impracticable and was abandoned without ever having been put in practical use.

334 R. D. Q. How far are the general statements contained in the publication quoted in cross-question 310, in regard to the inability of the incandescent light to supplant gas as a general illuminant, incorrect at the present time, even taking into account all of the improvements that have been made up in electric lighting, since the time of the publications referred to?

A. My own opinion is, although I have never looked up the statistics especially, that in a broad sense the electric light has not thus far supplanted gas at all; that is to say, that it has not materially diminished the number of gas lights in service or the actual profit of the gas industries. It has largely created a new field of its own. It is supplied at a considerably higher price as a rule, and while, no doubt, it has replaced the gas lights and caused their discontinuance in very many instances, yet this loss has been made up, and perhaps more than made up by the general demand which has been created in the public mind for better general illumination. I am quite sure that the returns of the gas companies taken as a whole, would show that their profits had not, as yet, been sensibly diminished by the competition of the electric light.

335 R. D. Q. Is it still true, as stated in these publications,
2386 that a considerable loss is incurred by subdivision, that is to
say, that less light is produced with a given amount of energy,

or for a given expenditure, with a great number of small lights than with a few large lights?

A. It is just as true as it is ever was, and it is true in one sense, not only of electric lights, but of gas lights and even of tallow candles. The same amount of energy which is required to produce say ten 16-candle lights would produce an amount of light much greater than 160 candles if it is all concentrated in one lamp. But this is not important. The question is, whether or not a thousand 16-candle lamps can be lit by the expenditure of 1,000 times as much energy as that required for one lamp or *vice versa.* And this we now know to be the case. In other words, the loss of light by subdivision is not sufficient to make the light cost more than the consumer is willing to pay for it. It might have been argued in the same way, that the steam engine is an impracticable machine because it wastes 80 or 90 per cent. of the energy contained in the coal which it consumes. The comparisons which were in the minds of the authors of the extracts quoted, were obviously between the arc light and the incandescent light. It is true to-day that with the arc lamp we can get at least ten times as much actual light per horse power as with the incandescent lamp, and we may say, if we please, that this 90 per cent. or more, of loss is due to subdivision. But on the other hand a large proportion of the light actually produced by the arc light is wasted after it is produced, because it is not usefully distributed; so that after all the amount of light which is actually utilized is probably as great in the case of the incandescent lamp as in the case of the arc lamp.

Defendant's counsel by consent of complainant's counsel, makes the following objections to redirect questions and answers of the witness, and to exhibits filed in evidence in connection with such examination; viz: objects to R. D. Q. 320 and answer thereto, as immaterial, irrelevant and incompetent. Same objection to R. D. Qs., and answers thereto, 322, 323, 324, 325, 326, 327, 328, 330 and 331.

2387 Also objects to R. D. Q. 319, and answer thereto, and Complainant's Exhibit Sawyer-Man British Patent 4705 of 1878 as new matter, not growing out of or relating to the cross-examination, nor is the same proper redirect examination. Same objection to R. D. Q. 328, answer and exhibit.

Recross-examination by Mr. Donnelly:

Counsel states that he does not intend to waive his objection by cross-examining the witness, but makes such recross-examination, *de bene esse.*

336 R. X Q. In answer to R. D. Q. 325, you state among other things, that so far as you know, the alternating system was first introduced into practical use as a method of subdividing the electric light, by Paul Jablochkoff in Paris. State whether or not such system was introduced into public use and what commercial success, if any, attended it.

A. The Jablochkoff apparatus never went into public use as distinguished from experimental use, so far as I am aware. It only became a commercial system after having been modified and improved by Gaulard and Gibbs.

337 R. X Q. When was the Jablochkoff system modified and improved by Messrs. Gaulard and Gibbs?

A. In 1881 and 1882.

338 R. X Q. When and where was the system of Gaulard and Gibbs introduced into public use, so that it was recognized, if at all, as a commercially useful system?

A. It was put in use on the Metropolitan railway in London, on November 17, 1883, and was continued in operation for several months. A great deal of discussion arose at this time as to whether the results were commercial, that is to say, whether it was a more costly method of distribution than by direct currents, or not: a question which was not satisfactorily determined by the results in this installation. In 1885, early in the year a commercial installation on quite a large scale was put up in London, and the results were such that from that time on, the success of the broad
2388 idea of distribution by high-tension currents and induction coils may be said to have been established. Other improvements have been made since that time in the direction of increased efficiency and perfection of regulation, which have largely added to the utility of the system.

In this connection I wish to correct my answer to redirect question 325. The exhibition in London was in October, 1882, instead of October, 1881.

339 R. X Q. Then if I correctly understand your answer, the practical commercial success and utility of the alternating system was first recognized about the year 1885?

A. That I think is substantially true.

340 R. X Q. When was the alternating system for incandescent lighting first introduced into the United States for practical commercial use, and by whom?

A. The first apparatus was imported by Mr. George Westinghouse in the summer or early in the fall of 1885. The first central station plant erected and sold was at Buffalo, N. Y., and this plant was started on the 30th of November, 1886, by the Westinghouse Electric Company.

341 R. X Q. In redirect question 319, your attention has been called to British letters patent, No. 4705 of November 19, 1878, and you have stated in substance that the automatic regulating apparatus therein described, does not contain the defects embraced in the automatic regulating devices of the United States patent 205,305. Will you please refer to said English patent and indicate by page, or otherwise, that portion of the specification of said patent which describes such automatic regulating mechanism?

A. Provisional specification, page 4, line 23, to page 5, line 8, inclusive, and complete specification, page 12, line 46, to page 13, line 33. The description in the provisional and complete specification appears to be identical. The description is as follows:

"By figures 5, 6 and 7 of the drawing is shown an adjunct of the distributing apparatus by means of which and its connections with the motive power actuating the electric generator, the supply 2389 of current is increased or decreased according to the wants of the lamps or other apparatus in operation. Figure 5 is a side elevation of this apparatus; figure 6, a top view; and figure 7, a cross-section. A is any suitable base piece; B, an electro-magnet; C, an elongated armature upon the end of a T-shaped cog bar D arranged to slide in grooves cut in piece E, which piece is pivoted at P in standard F; H and I are pinion wheels meshing in the cogs D, according as that bar is tipped one way or the other. These pinion wheels are in constant motion (motive power not shown) rotating in opposite directions as indicated by the arrows. When the magnet B is not of sufficient power, the spring M by means of roller L which it carries, depresses the rod D so to cause its cogs to mesh with pinion I. When the magnet B is strong enough to overcome the spring M the cogs of rod D are thrown out of gear with pinion I and into gear with pinion H; G is a steam chest containing valves operated by a rod K jointed at O with rod J, and rod J is jointed at N with the cog bar D. The rod K moves to the right or left and opens or closes the steam valve according as the spring M or magnet B preponderates in power; Q is the generator of electricity; the points *x* and — represent the working parts of the circuits of the conductors R S T. The magnet B is constantly in the circuit of the conductor. When the supply of current is about right the cog bar D will be in a state of vibration over the pinions I and H. When the circuit of conductor S is made, but half the current originally flowing in R passes through R and the effect upon magnet B is lessened; the armature C then rises and rod D meshes into pinion I whereby the valve is moved and more steam let into the engine and the generator correspondingly actuated. When the circuit T is established the flow through R is again diminished and a similar operation of the parts results.

It will be seen that the generator so controls the steam or 2390 other power actuating the generator of electricity, that the power is increased or diminished as the demand for the current is increased or diminished, and while I have shown the result as accomplished in one way, I do not intend to limit the invention to the precise apparatus and the manner of its operation shown and described. It is preferred, as shown and described, to place a sensitive magnetic apparatus in the circuit of the generator, which when a lamp is lighted, so as to speak, automatically takes cognizance thereof and supplies that quantity of steam to the engine which is necessary to drive the generator at that speed which will give the exact required volume of electricity. The apparatus is so constructed, however, that the regulator may be made to start different generators or couple different parts of a single generator in circuit, as may be required to supply the current, or the regulator may be arranged to control the current by the automatic changing of resistance. There are in fact many ways naturally suggestive to vary the application of the invention, and hence the invention is not limited to the employment of any special form of apparatus, but includes also the substance of the form."

342 R. X Q. In making your answer to R. D. Q. 319, do you mean to be understood as saying that an automatic regulating apparatus made in strict accordance with the drawings of said patent No. 4705, would be a practically operative automatic regulating device?

A. I see no reason why it should not; I think it would.

343 R. X Q. Is your opinion based upon the practical use of such an automatic regulating device, or the observation of such an apparatus in actual operation?

A. It is not; I have never seen a regulator of the precise mechanical construction described, though I have seen several embodying the same mechanical principles. The apparatus is so simple that a mere inspection of the drawings would seem to be quite sufficient to determine the question.

2391 344 R. X Q. Have you any knowledge that an automatic regulating apparatus like that shown and described in said British patent was ever constructed or used?

A. No.

345 R. X Q. You have referred to the fact that in the year 1886 you purchased U. S. patents of Messrs. Gaulard & Gibbs in behalf of Mr. Westinghouse for the Westinghouse Electric Company. Were you then in the employ of Mr. Westinghouse, or the Westinghouse Electric Company, and if so, in what capacity?

A. I was not, except from time to time upon special commissions, as my services might be required.

346 R. X Q. How long is it since you were regularly and steadily employed by the Westinghouse Electric Company, and what is the character of such employment?

A. Since the middle of last summer, July 1888, I think it was. Since that time I have been employed a considerable portion of the time in connection with business in Europe, most of my time while in this country has been occupied in miscellaneous service as an expert, making examinations of patents and inventions and giving testimony in suits in the court, and assisting in the prosecution of applications in the Patent Office.

347 R. X Q. Are you a stockholder in the Westinghouse Electric Company, the lessee of the complainant in this suit?

A. Yes.

348 R. X Q. Referring to redirect question 331, wherein you have stated that lamps of high resistance with conductors made of carbonized tar putty, as described in Mr. Edison's patent No. 223,898, would not be practical commercially; state whether your opinion is based upon actual experiment and observation of the behavior of such a conductor in a lamp or lamps.

A. It is not.

FRANKLIN L. POPE.

Subscribed and sworn to before me this 7th day of May, A. D. 1889.

CAROLINE E. DAVIDSON,
Special Examiner.

2392 And now, Lehighton, Pa., March 29, 1889, in pursuance of notice the taking of testimony on part of the complainant is proceeded with. T. B. Kerr, Esq., appears for complainant and H. D. Donnelly, Esq., for respondent.

Defendant's counsel desires to state that while he appears in behalf of defendant under the annexed notice, he reserves the right to cross-examine the witness further at some future day before the plaintiff closes its proofs, for the reason that the notice does not name the witness or witnesses who are to be examined at this hearing, and the defendant has had no opportunity to prepare for the cross-examination of the witness or witnesses under said notice.

Testimony of Tillie J. Sawyer.

TILLIE J. SAWYER, a witness on behalf of complainant, being subpœnaed, produced, and sworn, testifies as follows:

1 Q. State your name, age, residence, and occupation.

A. My name is Tillie J. Sawyer, am twenty-three (23) years of age. I reside at Lehighton, Pa. Have no special occupation. Am the wife of Geo. W. Sawyer, recently deceased.

2 Q. When did Mr. Sawyer die and where?

A. Mr. Sawyer died in New York city at the Mitchell house, February 26th, 1889.

3 Q. When did he go to the Mitchell house?

A. January 24th, 1889.

4 Q. Did you accompany him, and remain with him while he was there?

A. I did.

5 Q. Where was he buried?

A. In Lehighton.

6 Q. Who bore the expenses of bringing his body home to Lehighton, and of his burial?

Object- to by defendant's counsel as immaterial, irrelevant, and incompetent.

A. There are two answers to make to that, if you want me to answer that. The funeral expenses here were paid by the Independent Order of Odd Fellows here, of which he was a 2393 member in good standing. The funeral casket, I suppose was paid for by Mr. Russell. When Mr. Sawyer was dead I told Mr. Russell that if he would get a casket I would get the money here and send to him, and the lodge met the corpse at the station and took care of it after that.

Defendant's counsel seasonably objected to the statement of the witness that she "supposed that the casket was paid for by Mr. Russell." Also that part of said answer relating to what Russell said as hearsay and as a statement by a stranger to this suit, and moves to strike out those portions of the answer for those reasons.

7 Q. Did you send Mr. Russell the money for the casket?

Objected to by defendant's counsel as immaterial and irrelevant and as incompetent, because the question calls for testimony to a transaction between strangers to this suit.

A. I have not. I wrote Mr. Russell one letter, and have received no answer as yet.

Same objections continued as to answer, and motion to strike out the same.

8 Q. When did you first see Mr. Russell?

Same objection as to last question.

A. January 19th, 1889.

Same objection to answer with motion to strike it from the record.

9 Q. When and under what circumstances?

Same objections as — the last questions.

A. He came to Lehighton to visit Mr. Sawyer.

Same objection to answer and motion to strike it from the record.

10 Q. For what purpose?

Same objections as to last questions, also as incompetent and improper, because no sufficient foundation has been laid for the question or the evidence which it calls for, if it is intended 2394 thereby to impeach or contradict the evidence of Geo. W. Sawyer, deceased, the said Sawyer's attention not having been called or directed to the subject-matter inquired about specifically or otherwise when he was on the stand as a witness.

A. I do not know.

11 Q. Did Mr. Sawyer receive any money from Mr. Russell either directly or by remittance from New York, before he went to New York on January 24, 1889, accompanied by you?

Objected to as immaterial and irrelevant, and as incompetent because the question calls for a transaction between the witness and a stranger to the suit. Also that no foundation has been laid for the introduction of testimony concerning a transaction between the witness George W. Sawyer and said Russell, it not having been shown that said Russell had any connection or relations to or with the defendant in this suit. Also for the same reasons stated in the objections to the last question.

A. He received money but I don't know where from: I don't know from whom, I don't know who the money came from.

Same objections to the answer and motion to strike the same from the record.

12 Q. Do you know of his getting one or more post-office orders from New York?

Same objections as to last question.

A. He got one, I think.

Objected to and motion to strike same from the record.

13 Q. What was the amount of that post-office order?

Same objections as last, also as incompetent because the question calls for secondary evidence and not the best evidence.

2395 A. I don't know that it is necessary for me to state that.

Objections repeated with motion to strike the same from the record.

14 Q. Question 13 repeated?

Objections continued.

A. Fifty dollars.

Same objection to the answer and motion to strike same from the record.

15 Q. Did Mr. Sawyer receive any money from Mr. Russell in New York.

Same objections continued.

A. I do not know.

Objections continued.

16 Q. When were you married to Mr. Sawyer?
A. February 24, 1884.
17 Q. Was Mr. Sawyer sick for any considerable period after you were married?
A. He was for a year off and on.
18 Q. Was he able to work during that period?
A. At times.
19 Q. How much of the time?
A. About half of the time I suppose.
20 Q. Have you told one or more persons that during that period of sickness he received several hundred dollars from the Edison Electric Light Company, or from Mr. Russell?

Objected to as immaterial and irrelevant, and because the question calls for hearsay evidence, and the only apparent purpose of the question seems to be to contradict or impeach the complainant's own witness, or to lay a foundation therefor, which is not proper or admissible. Also that the question is leading. Also that the question is improper, in that it does not call for the witness's knowledge concerning a fact but for what she told somebody, which is not competent.

2396 A. No, sir. Not to my knowledge.
21 Q. How much money did he receive at or about the time of that sickness from Mr. Russell, or from the Edison Company?

Objected to as incompetent and improper because it assumes that Geo. W. Sawyer did receive money at or about the time of his sickness from Mr. Russell or from the Edison Company, and assumes that the witness knows that fact, which has not been shown. Also as immaterial and irrelevant. Also as incompetent if offered for the purpose of contradicting or impeaching the testimony of Geo. W. Sawyer, because no sufficient foundation was laid for the question when Geo. W. Sawyer was examined as a witness in this suit.

A. His sickness has been in the last year and he has received no money. It was in 1888 his sickness.

Same objections to the answer, and motion to strike it from the record.

22 Q. Was that the only sickness he has had since he was married?

A. No, sir.

23 Q. When was he sick before and for how long?

A. He was sick for two months in the spring of 1886.

24 Q. Do you know of his having received any money at or about that time from Mr. Russell or the Edison Company?

Same objections as to question 21 continued.

A. No, sir.

25 Q. Do you know of his having seen Mr. Russell about that time and giving him a statement as to his testimony in this case?

Same objection as to last question.

A. No, sir.

26 Q. Who paid your expenses and those of Mr. Sawyer at the Mitchell house, New York?

Same objections continued.

2397 A. I don't know.

27 Q. Is it a fact, or not, that you have informed, either by personal communication or by letter, one or more persons that you are offered instruction in stenography and typewriting, and then to have a place provided for you by Mr. Russell or by the Edison Company?

Same objections as to Q. 20.

A. I think not.

28 Q. Was such offer made to you by Mr. Russell, or on the behalf of the Edison Electric Light Co.?

Same objections as last.

A. No, sir.

Counsel for complainant hereby notifies counsel for respondent that the witness is here for cross-examination, and that he can cross-examine her now, and that complainant denies his right to call the witness for further cross-examination at any other time.

Cross-examined:

29 X Q. Please state when your husband died.

A. February 26th, 1889, at the Mitchell house in New York city.

30 X Q. Of what disease did he die?

A. Pneumonia, I think.

31 X Q. How long was he ill in his last sickness?

A. Six weeks.

32 X Q. Was he suffering from pneumonia during the whole of this six weeks' sickness?

A. No, sir; his disease was cancer of the stomach, pneumonia set in three days before his death.

33 X Q. Before the pneumonia set in, how long had he been ill of cancer of the stomach?

A. He had been doctoring here for consumption. The doctors in New York told him he was suffering from cancer of the stomach.

2398 34 X Q. Was he a great sufferer during the last six months of his life?

A. Yes, sir.

35 X Q. How long before his death was he conscious of the fact that the disease of which he was suffering was incurable and that his recovery was hopeless?

A. Two days.

36 X Q. Prior to that time had he been advised that the nature of this disease was such that he probably could not recover?

A. No, sir.

37 X Q. You say he was a member of the Odd Fellows' lodge here in Lehighton. How long had he been a member of such lodge previous to his death?

A. Nearly four years.

38 X Q. I understand you to have stated on your direct examination that he was a member of that lodge and in good standing therein; was that the fact?

A. Yes, sir.

39 X Q. Prior to your husband's decease, and while he lived in this community was he well known by the members of the lodge of which he was a member?

A. Yes, sir.

40 X Q. And stood well as a citizen and a man, did he?

Objected to as incompetent.

A. Yes, sir; he did.

41 X Q. During the last two months of your husband's life, did he suffer a great deal of pain from cancer of the stomach?

A. He did.

42 X Q. What led you to think that he suffered a great deal of pain?

A. He told me so.

TILLIE J. SAWYER.

2399 Circuit Court of the United States for the Western District of Pennsylvania.

THE CONSOLIDATED ELECTRIC LIGHT COMPANY
against
MCKEESPORT LIGHT COMPANY.

NEW YORK, *May 6th*, 1889.

Testimony Taken under the Order of the Court, Dated May 4th, 1889, *in Impeachment of the Testimony of the Witness Church.*

Present: Amos Broadnax, Esq., for complainant; Walter K. Griffin, Esq., and Grosvenor P. Lowrey, Esq., for defendant.

Deposition of the witness RICHARD N. DYER, on behalf of defendant, taken under the order of the court, dated May 4th, 1889.

By Mr. GRIFFIN:

1 Q. What is your name, residence, age and occupation?

A. Richard N. Dyer; East Orange, N. J.; lawyer; age, 31, and one of the counsel for the defendant in the above suit.

2 Q. Are you acquainted with the witness William H. Church, who has testified on behalf of complainant herein, and if so, state generally the nature of your acquaintance with him?

A. I first met Mr. Church in 1881, I think, about the time the testimony was being taken in the interference case between Sawyer & Man on paper carbons. He was present once or twice at the examination of Edison; witnesses and I met him there. Since
2400 that time my acquaintance with him has simply been a nodding acquaintance, with the exception of an occasional inquiry on his part after the health of my father, whom I believe he met at the same time.

3 Q. Have you read the cross-examination of the witness William H. Church, conducted by Mr. Griffin, being questions 42 to 188 inclusive, with the Defendant's Exhibit "Church Statement of Facts," and the Complainant's Exhibit "Tomlinson Telegram," and "Church's Letter to Tomlinson" offered during the conduct of such examination?

Objected to on the ground that there was no cross-examination of the witness Church.

A. Yes, I read the entire deposition of Mr. Church, taken in this case this morning, including the copies of the exhibits offered with his deposition.

4 Q. In the cross examination of Mr. Church various questions were asked as to interviews had by him with yourself and Mr. Tomlinson, beginning early in the year 1887. Please state generally how those interviews came about and your recollection as to the same.

Same objection.

A. Some time, I think, in the month of May, 1887, Mr. Church called at my office, No. 40 Wall street, and being shown into my private office made a statement to me of the matters covered by the interviews. At that time Mr. John C. Tomlinson occupied the same offices with me. He, Mr. Tomlinson, had charge, as solicitor for the Edison Electric Light Company, of the patent litigations of that company, including the defense of the suit brought in the southern district of New York by the complainant herein against the Edison Electric Light Company on the patent in controversy in this case. I assisted Mr. Tomlinson in work upon these litigations. Mr. Tomlinson having charge of the litigations, I told Mr. Church, 2401 before he had proceeded very far with his statement, that time would be saved if we saw Mr. Tomlinson, and the statement was made to both Mr. Tomlinson and myself. Thereupon I took Mr. Church into Mr. Tomlinson's private office and introduced him to Mr. Tomlinson and a further interview was had lasting for some time.

5 Q. Did Mr. Church come voluntarily, or did he come by invitation or suggestion of yourself or Mr. Tomlinson in any way?

A. Entirely voluntarily.

6 Q. Had you been directly or indirectly cognizant of the subject-matter of his conversation prior to his coming to you?

A. His statement to us on the occasion of his first visit was the first I had ever heard of the matter.

7 Q. After this first interview, how many subsequent interviews were had by Mr. Church with you or Mr. Tomlinson, and up to about what time did those interviews continue?

A. At the first interview Mr. Church made a proposition which he desired taken under consideration. He called frequently at our offices after that time inquiring whether we had reached any conclusion in the matter, and on the occasion of these calls he would sometimes go after a few minutes' conversation, and sometimes prolonged the interview to half an hour. He called so frequently that he finally asked us to telegraph him when we had reached any conclusion in the matter. A final interview was had in response to a telegram from Mr. Tomlinson. This took place in the latter part of June, 1887. The interviews might be stated to consist of two principal interviews, one at the beginning and one at the end, and a number of intermediate interviews arising from Mr. Church's calls to inquire if we had reached any conclusion.

8 Q. At the first interview as to which you have testified, what were the propositions and statements made by Mr. Church to you and Mr. Tomlinson?

A. Mr. Church said that the Sawyer & Man patent on fibrous carbon which had been secured as the result of the interfer- 2402 ence with Mr. Edison was absolutely invalid, and that he possessed information which when proved would make it so. He had with him a statement in his handwriting which appears as "Defendant's Exhibit Church Statement of Facts," and also copies of some of the agreements referred to in that statement. Mr. Church stated to us that the various matters covered by the Sawyer and Man patents, including the fibrous carbon patent in suit in the

New York case, had been invented by Mr. Sawyer before he met Man, but had been concealed from Flanagan, who was entitled to an interest in the inventions under his agreement. Mr. Church also stated that the fact that such an agreement existed between Flanagan and Sawyer was not known to Mr. Man when he became acquainted with Mr. Sawyer, but that experiments were conducted by Mr. Sawyer at Mr. Man's expense with the intention of securing patents in the name of Mr. Sawyer alone. One morning Mr. Church was at Sawyer's shop when he showed Man for the first time the Flanagan agreement. Church stated that Man seemed very much incensed and put out about the agreement, and said that some plan would have to be devised for getting around it. Church stated that Man proposed as one plan that they should give Flanagan some kind of notice or reimburse him under his agreement, but that Man, in discussing that matter, concluded that that plan would not work because the inventions had been concealed from Flanagan, and if the concealment was continued any such settlement would be ineffective. Church also stated that Man suggested the plan which was finally adopted—namely, that he and Sawyer should take out the patents as their joint inventions and in that way the obligation to Flanagan would be avoided. That suggestion Mr. Church stated was adopted by Sawyer, and the result was a certain agreement between Sawyer and Man to which Mr. Church called our attention, in which they agreed to take out the patents as joint inventors. Mr. Church stated that since the patent, including the patent in suit, had been taken out as the joint invention of Sawyer and Man, when they were 2403 really the sole invention of Sawyer, and were taken out in that way to defraud Flanagan under the contract, he thought the proving of those facts would invalidate the patent, but he suggested that in order to take advantage of those facts the Edison Electric Light Company ought to own the Flanagan interests under the contract with Sawyer. That, Mr. Church said, could be purchased, and he would undertake to do it for us. Mr. Church also stated that he had certain other very important information which of itself would be sufficient to invalidate the patent in suit, but which he could not tell us about because the minute he told us what it was we would be able to take advantage of it and would not require his services. That information he stated was not the Flanagan interest, but was an entirely distinct source of information which we knew nothing about. As a part of this interview a discussion of the experiments of Sawyer and Man took place, and of the testimony of Mr. Church in the interference case, and Mr. Church stated to us that he had not actually seen the things done which he testified to in interference case, or at least at the time he testified did not recollect having seen them done, but that Albon Man had told him that such were the facts and had gone so far as to dictate to him memoranda of what the facts were and that he, Church, had gone on the stand and testified upon the information given him by Albon Man and without any recollection himself of the facts. Mr. Church then proposed that the Edison Electric Light

Company should pay him $5,000 down in cash and $10,000 contingent upon the patent of Sawyer & Man on fibrous carbon being declared invalid. He said that Mr. Schuyler, of No. 44 Broadway, had in his possession papers which would show the invention by Sawyer before he met Man, and Mr. Church left us with the understanding that he would make an appointment with Mr. Schuyler for us to see the papers in his possession.

9 Q. State what occurred at the last principal interview after the sending of a telegram to Mr. Church which you have mentioned. I mean the interview that took place at the end of June, 1887?

2404 A. Mr. Tomlinson was about to *be* begin, or had begun, the cross-examination of Albon Man in the New York suit and he telegraphed Mr. Church to call with a view of securing such additional information, if any, that he could make use of in the cross-examination. At this interview the same ground was gone over as at the first interview, but in more detail, as I now recollect it, with regard to the falsity of Mr. Church's deposition in the interference case. In discussing this matter with Mr. Church, Mr. Tomlinson turned over the pages of the interference record, which was before him, and asked Mr. Church in detail with reference to his own deposition as to whether he had at the time of giving the deposition a personal recollection of various important matters about which he testified. One point I recollect was with regard to whether he knew himself, or had only been told, that paper carbons had been employed, and that paper had been carbonized, and that paper had been prepared for carbonization by cutting it out. As to all of these matters Mr. Church replied that he had no recollection at the time of giving his deposition in the interference case, nor had he at the time of our conversation of seeing these things himself, but that Mr. Man had told him that they did occur and he had testified from Mr. Man's statement. With regard to accepting Mr. Church's proposition, Mr. Tomlinson told him in substance that we could not put ourselves in a position of purchasing testimony and could not accept any proposition of the character proposed by Mr. Church. Mr. Tomlinson asked Mr. Church if he could not name a moderate sum for which he would make a statement of the truth, whether in our favor or against us, not only as to the Flanagan interest but as to his own testimony in the interference case, and as to the information which he withheld and which he insisted was of so great importance and would alone be sufficient to invalidate the patent, and after having made such a truthful statement, whether the facts were for us or against us, that we would then, provided we concluded to use his services, arrange with him for a reasonable *per diem* compensation for any time he
2405 might give to obtaining information or testifying in our behalf. Mr. Church did not accept this proposition, but replied that this very important information which he withheld could be used by us without his assistance the moment he gave it to us, and that we would not need his services after he had made the statement, and hence he could not name any moderate sum which would be a sufficient inducement to him to make such a statement. In

return he made a proposition that the Edison Electric Light Company should pay him $2,500 in cash and $15,000 contingent upon the patent being declared invalid. He said that he was willing to leave the much larger sum as contingent upon our success in the litigation because he felt absolutely certain that the patent would be declared invalid if the testimony was given of which he had information. We told Mr. Church that we could not even undertake to carry such a proposition as the one he made to the officers of the Edison Company, but he insisted that we should do so, and left without definitely settling the matter.

10 Q. Was any statement made by either you or Mr. Tomlinson in your presence to Mr. Church as to any intended disclosure by you of any arrangement you might make with him in the event of his testifying?

A. Yes. Mr. Tomlinson and myself both stated to Mr. Church, as an additional reason why any such proposition as that he made could not be accepted, that in using him as a witness we would state fully on the record what our arrangement was with him, so that the court could see the precise conditions under which he was testifying. We thought this explanation might appeal to him even if the explanation based on the moral question did not.

11 Q. What explanation, if any, did you or Mr. Tomlinson in your presence, make to Mr. Church as to the position he would legally be put in by testifying that his previous deposition in interference was either in whole or in substantial part false?

A. We called Mr. Church's attentien to the fact that if he went on the stand to testify as a witness he would be obliged to state that his testimony in the interference case was false. 2406

12 Q. What did Mr. Church say to this?

A. Mr. Church admitted that that would have to be his attitude as a witness. Mr. Church said that he could be of value to us as a witness and we told him that as a witness he would have to confess to having testified falsely in the interference case, and that if he did so testify it was so not likely that the court would believe him anyway; and we told him that before using him as a witness we desired in fairness to him to explain what his attitude must be.

13 Q. What do you mean by your expression in the last answer that Mr. Church would have to admit on the stand that he had previously perjured himself: what compulsion, if any, did you explain to him there was in the matter?

A. We understood that he was ready to tell the truth, and having told us that the things testified to in his interference deposition were not true we explained to him that in order to tell the truth he would be compelled to admit that he had before sworn falsely.

14 Q. Was any proposition at any time made by you or Mr. Tomlinson, or so far as you know by the Edison Company, to Mr. Church, or any inducement direct or indirect held out to him in these matters to testify or to give any information?

A. No, none whatever.

15 Q. In respect to the matter that you have mentioned, of his naming a moderate consideration for giving a statement to you of

the facts, was any inducement direct or indirect of any nature made or held out to him as to what that statement should be?

A. No, none whatever. He was simply to make a statement of the truth, whether the facts were favorable or unfavorable to the Edison Company.

16 Q. I call your attention to X Q. 74, by Mr. Griffin to William H. Church in this suit, and ask you to read in connection therewith X Qs. 71 to 73, with the answers thereto, and state
2407 whether or not the statements of the witness Church, in the answer to X Q. 74, is true or not?

Objected to on the ground that there was no cross-examination of the witness Church.

A. It is not true, as I have already stated, the most important information apparently which Mr. Church had was that which he withheld because he thought we would not require his services, in order to take advantage of it after he had disclosed it to us, and that information he insisted at all his interviews was sufficient to render the patent absolutely invalid.

17 Q. Did you learn from him whether this undisclosed information had any reference to the Flanagan interest?

A. He told us that it was an entirely separate matter from the Flanagan interest. The facts as to the Flanagan interest we understood he fully disclosed to us.

18 Q. I ask you similarly whether the statements of the witness in answers to X Qs. 76, 77 and 78, are true as to the facts?

Same objection.

A. They are not true. Mr. Church always insisted that the proof in his possession was clear that the invention of the patent in suit was made by Sawyer alone before his association with Man.

19 Q. I ask you to read Re-X Qs. 96 to 99 inclusive, and to state whether or not those answers are true as regards the interference records left by Mr. Church with you and Mr. Tomlinson. Please state what interference records Mr. Church did leave with you or Mr. Tomlinson?

Same objection.

A. At the first interview Mr. Church left a statement of facts, Defendant's Exhibit "Church Statement of Facts," and copies of some or all of the agreements referred to in his statement. He
2408 also left a copy of the Sawyer and Man record in the interference of Sawyer and Man *vs.* Keith *vs.* Maxim.

20 Q. Is the statement of the witness Church in answer to Re-X Q. 100 true?

Same objection.

A. This statement is absolutely false. These are the points as to which the statement appears to be untrue; we did not request him to engage in our services in trying to defeat the patent in suit, but he urged himself upon us, insisting that he could defeat the patent. He did not tell us that he did not see how he could be of any service to us, but we told him that we did not see how he could be of any service to us unless he would disclose the truthful information which he said he had and then leave us to judge as to whether the information would be such as we could use. Mr. Church's statement that Mr. Tomlinson produced a printed record of his testimony in that case—which I understand to mean the interference case between Sawyer and Man and Edison on paper carbon—and "he agreed with me that I could not testify in their behalf," contains elements of truth and elements of falsity. The fact is Mr. Tomlinson produced the record of Mr. Church's testimony in the interference case and asked Mr Church whether a number of things he had testified about were true or false, and Mr. Church replied that they were false. Thereupon Mr. Tomlinson explained to Mr. Church what his attitude must be when testifying as a witness, and that since he would have to admit that he swore falsely before, the court would probably not believe him now, and for that reason Mr. Tomlinson thought that he, Mr. Church, could not testify in our behalf so as to be of any value to us. Mr. Church's statement that Mr. Tomlinson then wanted him to think the matter over and see if he could not see some way in which he could be of service to us is entirely unwarranted by anything that occurred within my recollection, since throughout these interviews Mr. Church continued to urge that he could be of value to us and 2409 our effort was to see how he could be. Mr. Church's statement that a compensation of $1,000 a day was named is entirely without foundation. My recollection is that no definite compensation was offered to Mr. Church for his services, even if we should require them. The only discussion as to paying him a *per diem* for his services was in connection with the request I have already spoken of that we made of Mr. Church to name a definite moderate sum for which he would make a statement of the truth whether for or against us, and that then if we should need his services after reading over the statement we would pay him a fair compensation for the time employed. But he never accepted this proposition and never went far enough to name either the sum for which he would make the statement or the *per diem* which he would accept if we should conclude to employ him after the statement was made. There may be other particulars in which Mr. Church's answer to Q. 100 is untrue, but the above are what occur to me at the present time.

21 Q. This statement of Mr. Church—to what matters was it to relate? To the Flanagan matter or the undisclosed information, or to what?

A. More particularly to the undisclosed information. But it was also to include, as I understood it, all matters relating to the case which were within Mr. Church's own knowledge, including the facts as to his testimony that he had given in the interference case.

22 Q. Is Mr. Church's answer to R. X Q. 101 true?

Same objection.

A. It is not true. The Flanagan contract seemed to be a very small portion of the matter which Mr. Church had for sale, an element of larger importance being the other information which he could put us in the way of getting, and in the furnishing of which he seemed extremely desirous to enter our service. His attitude was not at all what he says it was, of being willing to serve, 2410 provided we could show him wherein he could be of service, but he always insisted that he could readily prove that the patent in suit was invalid, and was exceedingly anxious to make an arrangement by which his services could be used for that purpose.

23 Q. Similarly are the statements in the answers to R. X Qs. 102 and 105 true?

Same objection.

A. They are not true. Mr. Church came to us with a proposition that we should pay him $5,000 down and $10,000 contingent upon the defeat of the patent. His statement that our "scheme" "appeared to be feeling around as to whether I could recollect anything that would be of any service to them" carries with it an entirely false impression, since all the interviews were based upon a scheme that Mr. Church had to defeat the patent by the Flanagan interest, by the falsity of his own testimoney and, more especially, by the undisclosed information. We never tried to get Mr. Church to recollect whether he could be of any service, since his attitude always was that the information which he withheld would be entirely sufficient to invalidate the patent. Having forced that fact upon us a great many times we naturally were desirous of getting that information and so proposed to him that he should suggest a moderate sum for which he would make a statement of the entire truth as to the matter. The proposition referred to by Mr. Church in answer to R. X Q. 100 I assume to be the one he speaks of in answer to R. X Q. 100, and which I have before stated has no basis in fact at all.

24 Q. Did Mr. Church ever ask you to pay $60,000 for the Flanigan interest, and did you ever decline said proposition, as stated by the witness Church in R. X Qs. 106, 107, 112 and 113?

Same objection.

2411 A. Mr. Church never made any such proposition, and we never declined any such proposition. In fact, Mr. Church never made a separate proposition as to the Flanagan interest, but his proposition that he should pay $5,000 in cash and $10,000 contingent, which was subsequently modified to $2,500 in cash and $15,000 contingent, was to include everything within his possession and control, that is to say, the Flanagan interest, the use of himself as a witness and the information which he withheld, with his services in procuring that information and getting it properly in form of proof.

25 Q. Read through the questions and answers Re-X. Qs. 114 to

116 inclusive, and state how far, if at all, the answers of the witness thereto are true.

Same objection.

A. With regard to his answer 114 to our X Q., Mr. Church certainly, seriously as we supposed, offered his services to defeat the patent. His answer to 115 X Q. I consider to be entirely untrue, as I have before explained. Mr. Church at no time stated that he had very little recollection of the subject-matter of the interference, and that he would rely upon us to refresh his memory, since his recollection seemed to be entirely clear, at least if his statements represented his recollection, that at the time he testified in the interference case, and at the time of his conversations with us he did not recollect having seen the things he testified about. With regard to the answer to 116, Mr. Church did make the definite proposition that we should pay him $5,000 in cash, and $10,000 in the event the patent was declared invalid.

26 Q. Similarly I ask you whether the witness' answers to X Qs. 117 to 119 inclusive, are true?

Same objection.

A. Mr. Church's statement that he told us that the only thing he could consider would be a purchase of the Flanagan interest is entirely untrue, since he never made any separate proposition for the Flanagan interest, but his proposition covered the entire 2412 matter. He gave as a reason why he wanted such a large amount of money that the invalidation of the patent would entirely destroy the value of the stock of the Consolidated Electric Light Company, and make his shares in that company worthless, and for this he wished to be reimbursed, and he also said he felt under obligation to pay the parties holding the Flanagan interest at least a part of the money they had advanced for the experiments of Mr. Sawyer, under the Flanagan contract.

27 Q. Is the answer to Re-X Q. 122 correct?

Same objection.

A. This answer is entirely untrue, or at least conveys a false impression. Mr. Church called a number of times before June 30th, 1887, but always, as I recollect it, at his own suggestion. He was exceedingly importunate, calling frequently and without any appointment being made. I recollect a number of times both Mr. Tomlinson and myself telling him that when *he* got ready to see him we would let him know, but the suggestion did not seem to be effective with him since he continued to call every few days.

28 Q. You have stated that a telegram was sent to him some time in June, 1887. At whose request or suggestion was such telegram sent?

A. Mr. Church suggested a telegram, I think, as a quicker way of reaching him than by letter. He seemed to be annoyed at the time Mr. Tomlinson and myself took to consider the matter.

29 Q. Did Mr. Church call in response to that telegram, if so, when?

A. Mr. Church called in response to the telegram, and we had our last interview, which I have testified was a long one, at the end of June.

30 Q. Is the statement, then, by the witness Church, in answer to Re-X Q. 135, true or false?

Same objection.

A. It is false.

2413 31 Q. What was the date of this interview by yourself and Mr. Tomlinson with Mr. Church in response to that telegram?

A. It must have been the 29th or 30th of June, 1887. My recollection is that it was the 29th.

32 Q. At the conclusion of this interview, in response to the telegram, did Mr. Church make any arrangements as to seeing you again?

A. He insisted that we should consider his proposition, and said he would call again a couple of days after.

33 Q. Did he so call; and if so, did you see him?

A. I understand that he called, because Mr. Tomlinson afterwards showed me a note from Mr. Church which he had written in our office, but I was out at the time.

34 Q. Are the answers of the witness Church to Re-X Qs. 145 to 163 inclusive, true or false?

Same objection.

A. His answer to X Q. 145 is untrue. He said in substance that his testimony in interference was false. The reason that he advances why he could not have made such a statement is not a good one, because at the interview the matters which he had testified about in the interference case were discussed, and, as I have before stated, his attention was called directly to some of his answers in the interference case. His answer to 146 X Q. is false, as I have just stated. His answer to 147 X Q. is false. He had a dozen interviews at least with us; and at no one of them did he state that he had no recollection of what he had testified to in the interference case, since he seemed to be fully acquainted with the facts in the interference and with his testimony. As to 148, the same answer to 147 applies, also 149. As to 150, Mr. Church's answer is untrue. He did state to us at the particular interview, namely, our last one; and at our first interview, that Mr. Man dictated memoranda to him as to what had been done, and that he, Church,
2414 swore to those facts on Mr. Man's statement. Answers to X
Q. 151 and X Q. 152 refer to these same memoranda. Also answer to 153. Answers to 154 and 163 are untrue, as I have before explained. Mr. Church never stated that he could not recollect what he had testified to in the interference case, but seemed to be fully aware of his testimony in that case, and had his attention called to it during our interviews, as I have before stated. He also

stated to us what he has directly denied in these answers, that he had no recollection of the principal facts about which he testified, but that Mr. Man told him that the things occurred, and that the experiments were made, and went so far as to dictate memoranda of the facts about which he wished him to testify, so that he would not go astray as a witness. He also stated that Mr. Broadnax, who was the counsel for Sawyer & Man, also insisted that these were the facts, and that he ought to know them.

35 Q. Are the witness's answers to X Q. 165 to 167 inclusive, true? Where your previous testimony covers your version of the matter referred to in these answers I will not ask you to repeat the same.

Same objection.

A. They are not true, as I have already explained.

36 Q. Is the witness's answer to cross-question 172 true. Did he or did he not state as indicated in said question?

Same objection.

A. His answer is not true. He did make the statement referred to in the question.

37 Q. Similarly are the witness's answers to the cross-questions 173 to 181 inclusive, true?

Same objection.

A. They are not true. The questions are a fair statement of the facts, and the denials by the witness are untrue.

2415 38 Q. In testifying as you have done on this examination, have you been testifying from unaided recollection, or has your recollection been refreshed by memoranda of any kind; if so, please state what the same are?

A. The principal facts in the interviews with Mr. Church, the statements and propositions made by him, and our replies are all clearly matters of my unaided recollection. As to some of the details, more especially as to the dates of the interviews, my recollection has been refreshed by a statement of the facts which was dictated by Mr. Tomlinson and myself to our office stenographer within a few days after the last interview with Mr. Church. That statement I have in my possession, it having been turned over to me by Mr. Tomlinson with the other papers relating to the Edison litigations at the time he retired from the control of the litigations.

39 Q. I hand you a paper marked for identification Defendant's Exhibit "Tomlinson's Statement as to Church," May 6th, 1889, and ask you whether that is the statement which you refer to?

A. It is.

Cross-examination by Mr. BROADNAX:

40 X Q. The interviews about which you have been testifying, as I understand you, between yourself and Mr. Church, took place in the year 1887?

A. Yes.

41 X Q. How many interviews were there?

A. A dozen or more.

42 X Q. When did the first interview occur?

A. Some time in May, 1887, I think, or early in June.

43 X Q. Who was present at that interview?

A. Mr. Tomlinson, Mr. Church and myself.

44 X Q. Were you all three present during the whole time of the interview?

A. We were with the exception of the opening statement Mr.
2416 Church made to me before I took him into Mr. Tomlinson's
room, and which he repeated in the presence of Mr. Tomlinson when we were all three together.

45 X Q. What was his opening statement? Please to give his words as near as you can recollect them?

A. He said that he had information which would invalidate the Sawyer-Man fibrous carbon patent. He had not gone beyond this point when I suggested that since Mr. Tomlinson had charge of the litigation, it would save time to bring him into the interview and make one job of it.

46 X Q. Were those the first words he said when he came into your office?

A. I do not know whether they were the first words or not; I think not. The ordinary friendly salutation was the first, his usual inquiry after the health of my father, I think followed. But when he came to speak of the matters which brought him to my office, he stated in substance what I have just stated.

47 X Q. Did he state in the beginning the object of his calling *you* upon you seeking an interview with you?

A. Yes.

48 X Q. What did he state that object to be?

A. He said that he had this information which would invalidate the patent, and desired to make an arrangement by which we could avail ourselves of the information as defendants in the suit on the fibrous carbon patent pending in the southern district of New York.

49 X Q. Was Mr. Tomlinson present at the time he said that?

A. You asked me for his opening statement, as I understood you, before I took him into Mr. Tomlinson's room. Mr. Tomlinson was not then present, but the same statement was repeated by Mr. Church to both Mr. Tomlinson and myself after we went into Mr. Tomlinson's room.

50 X Q. What did you say in response to Mr. Church's
2417 statement that he was in possession of facts that would re-
sult, if made known, and proved, in defeating the patent in suit?

A. We told him in substance that we were desirous of getting the facts if we could do so legitimately.

51 X Q. Do you repeat now the language exactly that you used in replying to Mr. Church?

A. Not the language. I do not pretend to recollect the exact words. That was the substance of it, however.

52 X Q. Did you say that, or Mr. Tomlinson?

A. Both of us at different times during the interview. It was an expression that I recollect we repeated several times.

53 X Q. How long did that first interview last?

A. Upwards of an hour, I should think.

54 X Q. And was the whole of that time occupied upon the same statement?

A. In discussing the same matter, yes.

55 X Q. Was anything said at that interview about the Flanagan contract or interest in the Flanagan contract?

A. Oh, yes.

56 X Q. What was said?

A. Mr. Church showed us the statement which he had prepared and which is put in evidence and also the copies of the agreements, and those were read over and Mr. Church said that the disposal of the Flanagan interest under the contract was in his control.

57 X Q. Did he offer it for sale to you?

A. Yes; the interest was to be included in the arrangement which he proposed.

58 X Q. Was his offer to sell the Flanagan contract made separately from the offer to furnish you information that would defeat our patent?

A. No; the proposition covered all the matters.

59 X Q. Is it not true that the proposition to furnish you information regarding the patent in suit was made after you had got through negotiating about the Flanagan contract?

A. No, sir; it is not true.

2418 60 X Q. Was there no sum mentioned to you at which you could purchase the Flanagan contract?

A. No; not separately.

61 X Q. Did you not understand that the Flanagan contract came to you from Mr. S. B. Schuyler through Mr. Church?

A. Mr. Church stated that Mr. Schuyler had an interest in the Flanagan contract and that in including the Flanagan interest in his proposition, he was representing the owners of that interest.

62 X Q. Did you go to Mr. Schuyler's office to look at the drawings or the papers or facts appertaining to that contract?

A. Yes, we did.

63 X Q. What did Mr. Schuyler show you?

A. Mr. Schuyler showed us some photographs of sketches, representing that they were the photographs of original sketches which could be proved had been made in 1877.

64 X Q. Did he not also show you the original drawings from which those photographs were made?

A. He did not.

65 X Q. Did he say that he had them?

A. I think he did.

66 X Q. Did he offer to show them to you?

A. He did not.

67 X Q. And you came away without seeing them?

A. We did.

68 X Q. What conversation did you have with Mr. Schuyler about the purchase of the Flanagan contract?

A. No conversation on that subject. Mr. Schuyler said very little. Mr. Church was present, and asked Mr. Schuyler to show the drawings, and Mr. Schuyler produced them. Mr. Tomlinson and myself looked at them and then handed them back to Mr. Schuyler.

69 X Q. Do you mean the drawings or the photographs?

A. The photographs. Mr. Schuyler stated that the matter was in Mr. Church's hands.

2419 70 X Q. What did you say to Mr. Schuyler upon handing them back, the drawings and papers which you had been looking at?

A. Nothing.

71 X Q. Simply handed them back without remark or comment?

A. That is it.

72 X Q. What did you say to Mr. Church after seeing the drawings and the papers in the possession of Mr. Schuyler?

A. We saw no papers, only a few photographs, not exceeding four or five. We came out of the office with Mr. Church, as I now recollect it, and parted with him on the street, with the understanding that we would let him know when we wanted to see him.

73 X Q. Did you make no comments upon the drawings or papers which Mr. Schuyler had shown you?

A. I do not think we did. Not to Mr. Church.

74 X Q. How long was this after the first interview with Mr. Church?

A. I think it was the same afternoon, or possibly the next morning. Mr. Church left us at the first interview with the understanding that he would make an appointment with Mr. Schuyler for us to see the drawings. He came in either the same afternoon or the next morning, and told us of the appointment, which I think was to be an hour or so after he came into the office, and we met him at Mr. Schuyler's office.

75 X Q. Either that same afternoon or in the next day morning?

A. That is my recollection.

76 X Q. Did Mr. Church or Mr. Schuyler fix any price for the Flanagan contract?

A. No.

77 X Q. After seeing the drawings in the possession of Mr. Schuyler, did you decline to purchase the Flanagan contract then?

Objected to because the witness has stated distinctly that he saw no drawings, but only saw photographs.

A. No.

2420 78 X Q. When did you tell Mr. Church or Mr. Schuyler that you would not purchase the Flanagan contract?

A. We never had any conversation with Mr. Schuyler about the purchase of the Flanagan contract. At our first interview with Mr. Church we told him that we did not see how the purchase of the Flanagan interest would be of any use to us, and the interviews were continued as they were begun, with the understanding that

Mr. Church had information much more valuable than the information with regard to the Flanagan contract, which he could put us in possession of, and which would invalidate the patent.

79 X Q. Did you know what the Flanagan contract was before Mr. Church brought it to you?

A. Yes. It had been put in evidence in some of the interference causes with which we were acquainted.

80 X Q. You had read it, as I understand?

A. Yes.

81 X Q. Was there anything or is there anything in the Flanagan contract that bears in any way upon the invention of the patent in suit?

Objected to because the contract being already of record, shows for itself, and furthermore, because the question calls for an expert opinion, and the witness being called simply as a witness as to facts.

A. I have not the contract before me, and do not know that I would care to express an opinion upon the matter even if I had.

82 X Q. Did you not know as a matter of fact that the purchase of the Flanagan contract by you would not help you any in the defense of the suit?

Objected to as incompetent and specially objectionable under the restriction in the order of the court, and in further view of the fact that the argument of a case before the court at Pittsburgh 2421 requires that the witness leave at six o'clock this evening, and therefore, that he has not time for an irrelevant cross-examination.

A. No, I don't know that as a matter of fact.

83 X Q. Did you not understand that Mr. Church's object in calling upon you was to get money out of the Edison Light Company for some pretended information which he pretended to have?

A. That seemed to be part of his object.

84 X Q. Did you not know at the time of Mr. Church's visit, that he had testified on behalf of Sawyer and Man in the interference and was likely to testify on their behalf in this suit?

A. I knew he had testified, but did not know that he was likely to testify. The fact is he told us several times that he had been asked by Mr. Man to testify in the suit, and had told Mr. Man that he would not testify because he could not truthfully make the statements he knew Mr. Man wanted him to make.

85 X Q. As I understand you, Mr. Church did not tell you what the information was, or evidence was, that he could furnish that would defeat the patent in suit. Is that correct?

A. You are right as to the particular information that he withheld.

86 X Q. Well, did he as matter of fact give you any information that you thought would be of any value in defeating the patent?

Objected to as immaterial, the examination being restricted as to matters of fact, and not as to the value placed upon them by counsel for either party.

A. What he did tell me I have fully stated.

87 X Q. When Mr. Church told you that he had information or could furnish evidence that would defeat the patent in fifteen minutes, did you believe him?

A. He did not say that the patent in suit could be defeated in fifteen minutes, but that he could put us in possession of the
2422 information in fifteen minutes. Whether the information would be so effective or not, and could be so easily put in our possession, we had no means of judging.

88 X Q. Did you believe as a result of your interviews with Mr. Church that he could furnish you any evidence that would defeat the patent in suit?

Objected to as immaterial, the examination being restricted as to facts of the interviews and not to the inference or belief of the counsel.

A. He seemed sincere in his statements. We had no means of judging whether the information was of the character he stated it was or not.

89 X Q. Did you believe his statements?

Same objection.

A. Since he did not give us the information we had no means of judging whether his statements that he had the information were true or false.

90 X Q. Had you no belief upon the subject?

A. None, except his apparent sincerity and his willingness to make his reward largely contingent upon success in invalidating the patent.

91 X Q. Did he tell you how much stock he owned in the Consolidated Electric Light Company?

A. I don't think he did.

91½ X Q. Did not the fact that he refused to furnish you any information unless you gave him a considerable sum of money raise a suspicion in your mind that he was not telling the truth?

A. No, it did not.

92 X Q. Did you not believe at the end of your negotiations with Mr. Church that his sole object was to sell you the interest in the Flanagan contract, and such other information as he pretended to have, simply for the purpose of getting a large sum of money or a considerable sum of money from the Edison Light Company without his really being able to give you any information that would be of any value?

2423 & 2424 A. No, I had no such belief at all. I believed that he sincerely thought that he had information outside of the Flanagan contract and matters relating to it which would show the patent to be invalid, and that part of this information was the fact that he had testified falsely in the interference case. Another and more important part was what he withheld entirely, which he always insisted would of itself invalidate the patent.

93 X Q. Referring to the so-called statement of facts put in evidence by defendant's counsel did you consider that that statement of facts would be of any value to you in defeating the patent?

A. Not the statement alone; but if the fact could be clearly proved that Sawyer was the sole inventor of the invention of the patent in suit, that Man was not a joint inventor with Sawyer in the invention, and that the patent was taken out as a joint invention, not because they were joint inventors in fact, but in order to defraud Flanagan under his agreement, and that the court should find these facts to be proved, then I would consider that the matter would have a very large value in that the patent would be invalid.

95 X Q. Do you not know that those same facts were stated in the interference, substantially those facts, and that the question of joint inventorship was passed upon by the Commissioner of Patents in the face of those statements?

Objected to because the interference record is the best evidence of the fact.

A. No, I don't know that the facts were fully presented in the interference record. My recollection is that it was never proved that Sawyer had made the invention before his association with Man, and that it was never proved that the contract between Sawyer and Man to apply for the patent as a joint invention was made to defraud Flanagan, and it was never proved that Man suggested the making of such a contract and the taking out of the patent in that way in order to defraud Flanagan.

2425 96 X Q. Do you not know that Mr. Sawyer, during the pending of the interference, filed an affidavit with the Commissioner of Patents that he was the sole inventor of this invention of the patent in suit?

A. I believe an affidavit to that effect was filed by Sawyer, but whether during the pendency of the interference or not I do not know, and whether it ever got into the interference record and was considered by the Patent Office in deciding the case, that I do not know.

97 X Q. Your last interview, as I understand you, with Mr. Church, was on June 29th or 30th, 1887; now did it take you and Mr. Tomlinson from the latter part of May to the last of June to determine that you did not want to buy any evidence that Mr. Church had to sell?

A. It did not; that was determined in advance at our first interview. At that interview we distinctly stated to Mr. Church that we could not put ourselves or the Edison Company in the attitude of purchasing testimony, but that we were ready to pay a fair compensation for any time spent by Mr. Church in putting us in possession of the information.

98 X Q. Why did you telegraph Mr. Church on June 28th, 1887?

A. Mr. Tomlinson had commenced or was about to commence the cross-examination of Albon Man in the New York suit on the fibrous carbon patent. He desired to be in possession of all information that he could get as to the experiments of Sawyer and Man. His object, as I understood it, and it was a matter of discussion between us, was to see if we could not get Mr. Church to make a proposition which we could legitimately accept and which would put us in possession of such information as Mr. Church had. Consequently, Mr. Tomlinson telegraphed him to come to our office.

99 X Q. And did you not make any proposition to Mr. Church to put you in possession of such information as he had?

A. We made no definite proposition. We suggested to
2426 him that a proposition from him based upon the payment of
a moderate sum to make a statement to us of the truth, whether in our favor or against us, would be one which we might possibly be able to accept.

100 X Q. You knew, as I understand you, that Mr. Church had testified in behalf of Sawyer-Man in the interference, and in view of that knowledge you, as I understand you, sent for Mr. Church to tempt him to make a proposition to testify against the complainant in this case—such a proposition as you could accept?

A. I think I have already clearly stated our position. We knew he had testified in the interference, and he had come to us voluntarily and admitted that that testimony was not based upon facts within his own recollection. He also stated that he had other information which of itself would be sufficient to defeat the patent. We desired, of course, to know what the truth was, and to know all of the truth, and, the information which Mr. Church withheld being according to his own statement, of very great value, we were naturally anxious in the interests of our client to become possessed of that information if we could get it legitimately and without placing ourselves in the attitude of purchasing testimony. We did not think from the start, as I recollect it, that we could use Mr. Church himself as a witness, since, as I have already explained, we were very careful to show him that if he were used as a witness his attitude would have to be that he had testified falsely in the interference case, and the result would be that the court would probably not believe his more recent deposition. It was more particularly to place ourselves in possession of the information which he withheld that we asked him to tell us for what moderate amount he would consent to make us a full statement of the facts. However you may see fit to characterize it, this proposition did not appear to be sufficient of a temptation to even warrant his naming an amount.

101 X Q. You say that Mr. Church offered to furnish you such information or evidence as he had for $5,000 in cash and $10,000 contingent upon your success in defeating the patent. Now, when
he made you that proposition, did you not consider him a
2427 thoroughly dishonest man, and did you not continue to
tamper with him after that proposition was made to you?

A. We believed he was dishonest, and if my personal feelings had controlled my own action in the matter I would have had nothing further to do with him; but we felt that our duty towards our client demanded that we should obtain all the information we could, even if from a dishonest source. I have fully stated what we did, and will leave it to the judgment of the court as to whether it could be called tampering.

102 X Q. Did you believe that the testimony of a confessed liar would be of any service to your client?

A. No. As I have several times stated, we did not think that Mr. Church's testimony would of itself be of any particular value.

103 X Q. The attitude in which Mr. Church stood before you was that of a man who confessed that he had sworn falsely. Now, in the face of that attitude, as I understand you, you wanted him to make you a reasonable proposition for a truthful statement?

A. We wanted his statement more particularly as to the information which he withheld, the proof of which I always understood rested on other foundation than the testimony of Mr. Church alone. He freely told us the facts with regard to his own knowledge of the experiments of Sawyer and Man and no further statement from him could have benefited us as to those facts. If his statement had related entirely to his own knowledge of the experiments and his testimony in the interference case, it would have been of little value.

Q. Did it not occur to you as very suspicious if Mr. Church had any information that would be of benefit that he would not furnish it to you unless you paid him a considerable sum of money before he did so?

A. It did not strike me as suspicious at all. It struck me as quite in accordance with the character of the man.

105 X Q. What did you know of him as to his truthfulness or dishonesty before this conversation—these interviews?

2428 A. Nothing at all. My acquaintance with him was very slight, only a nodding acquaintance, and so far as I know we had no mutual friends.

106 X Q. If you believed that he could furnish you or would furnish you with information or evidence that would defeat the patent in suit, for $2,500 down and $15,000 in the event of success—I say if you had believed that and he could prove that—would you have been willing to give him the money $2,500 or recommend the Edison Company to do so?

Objected to as irrelevant, a hypothetical question.

Defendant's counsel again calls attention to the fact that the entire cross-examination has consisted of questions having no relation to the actual occurrences between the witness and Mr. Church.

A. No, I would not.

107 X Q. Do you recollect of Mr. Tomlinson asking me in my office during the examination of Albon Man on the cross-examination of him, whether or not I was going to call Mr. Church as a witness?

A. I do not recall it now.

108 X Q. You have related your first interview with Mr. Church, here in your office. How long after that interview did you have your second interview with him?

A. He called within a few days after to see if we were ready to talk to him about it, and continued to call frequently.

109 X Q. Confine your answer to the second interview.

A. On the occasion of some of these calls he would hang around the office for 15 or 20 minutes, and at other times he would stay only a few minutes.

110 X Q. What was said on the occasion of your second interview with him? Please to give his words and your own if you can recollect them.

A. At those various intermediate interviews or calls from Mr.
Church, the conversation consisted principally in his reiter-
2429 ating his statements, and insisting upon the importance of
the facts within his possession. On our part, we told him that we were not prepared to discuss the subject, and had not had time to consider it carefully. My recollection is, that both Mr. Tomlinson and myself were very busy examining witnesses, and that we had little or no opportunity to discuss the matter between ourselves.

111 X Q. Had you made up your mind what disposition you would make of the matter at the time you telegraphed him on the 28th of June, 1887?

A. I cannot say that we had. Mr. Church had not made any proposition which we could accept, but we hoped that we might be able to get him to tell us the truth on terms which we could accept.

112 X Q. At the interview with Mr. Church, who called in response to the telegram—how long did that interview continue?

A. I think he must have been in the office in the neighborhood of a couple of hours.

113 X Q. Were you talking upon this subject during the whole of that time?

A. We were.

114 X Q. And what was said by you and Mr. Tomlinson on the one side, and Mr. Church on the other, during that interview?

A. We went over the entire subject of the several elements of Mr. Church's proposition, as I have before stated. If you desire me to repeat this matter, I will be glad to do so.

115 X Q. I should like to have it repeated, giving the words as near as you can recollect them.

A. As to the order in which the subjects were taken up at the first part of the interview, I cannot now say, since they were discussed and rediscussed—the Flanagan interest was a matter of some discussion, and we told Mr. Church again, as we had at several of the interviews, that we did not see how the purchase of the Flanagan interest could be of any benefit to us. With regard to the use of Mr. Church as a witness to contradict what he had stated in his interference
deposition, we called his attention several times to the fact, that
2430 in testifying in the suit, his attitude would have to be that
he had testified falsely in the interference case, and that we did not see how he could be of value to us as a witness, even if he would consent to place himself in that unenviable attitude.

With regard to the "very important information" which he withheld, we asked him to name a moderate sum for which he would make a full statement of the truth of the matters, whether for or against us, and if, after reading that statement, we should conclude that he would be of service to us, he should, in advance, name a *per diem* amount for which we could have his services. He stated that he could put us in possession of the information which would defeat the patent in a very short time, stating, I think, 15 minutes time, but that the minute that information was given, we would have no need of his services, and hence he did not care to make any proposition of the character we suggested. We told him further with regard to his own testimony as a witness, and as a reason why such a proposition as he made could not be accepted that if he should be put on the stand as a witness we would feel obliged to state the precise arrangement that we had made with him. The facts as to the falsity of his testimony in the interference case were also canvassed somewhat more thoroughly at this interview than at the others, and Mr. Church stated in detail most of the important matters about which he had testified in the interference case that as to them at the time he gave his testimony in that case he had no recollection of those matters as facts within his personal knowledge, but that Albon Man had impressed upon him that such were the facts, and had gone to the length of dictating memoranda of the facts to him, and upon the information received from Mr. Man he gave his testimony in the interference case. At this same interview Mr. Church modified his proposition of $5,000 down and $10,000 contingent upon the defeat of the patent to $2,500 down and $15,000 contingent, stating that he was so certain that the information in his possession would bring about the invalidation of the patent that he was willing that the larger sum should
2431 be made contingent upon the accomplishment of that end.

I think I have stated the substance of what occurred at that interview. There are numerous details upon each topic which I could call to mind, and I might add that at this interview and at the first interview as well, Mr. Church stated to us that Mr. Man had told him that he should want to call him as a witness to carry back the date of the invention of Sawyer and Man of the fibrous carbon in the New York suit upon that patent, and that he, Church, replied to him that he could not testify as a witness, because as he, Man, well knew the facts that he, Church, was expected to testify to were not within his personal knowledge.

116 X Q. Did Mr. Church ever tell you what knowledge he was in possession of that he wanted $2,500 for cash and $15,000 contingent?

A. No, sir. That amount was to cover not only the information that he withheld, but also, as we understood it, what he would expect to pay to the owners of the Flanagan interest and what he would lose by the depreciation of his stock in the Consolidated Company and what he would consider adequate for his own services and a balm to his wounded feelings in placing himself in the position of having sworn falsely.

117 X Q. Who beside yourself and Mr. Tomlinson were present in making the memorandum referred to by you in refreshing your recollection about these interviews with Church—I mean the paper marked for identification "Tomlinson statement as to Church"?

A. Nobody, except the stenographer, our office stenographer, at that time a man by the name of Nugent who is not now in our employ. I do not know where he is at present. I have not seen him even on the street for many months, and do not know into whose employ he went when he left us

118 X Q. How long was this memorandum made after your last interview with Mr. Church?

A. I think within a week.

119 X Q. Made from your memory—Mr. Tomlinson's memory and your memory, as I understand it?

A. You are right.

2432 120 X Q. Mr. Church not being present?

A. Mr. Church was not present, of course.

121 X Q. Was the memorandum ever shown to Mr. Church?

A. No. It was simply designed to put in a permanent form the facts with regard to the interviews with Mr. Church while they were still fresh in the recollection of Mr. Tomlinson and myself.

122 X Q. Designed to be sworn to by you both in case of need?

A. I do not know that we looked so far ahead as that at that time.

123 X Q. Was it ever your intention to call Mr. Church as a witness in this case on behalf of the defendant, or any other case?

A. At the time of our interviews we were considering whether that could be done with advantage to the interests of our client. We never concluded that he could be used as a witness, either in the New York case or in this case, for the reasons that I have several times stated.

RICHARD N. DYER.

Sworn to before me.

WM. T. FARNHAM, *Spec. Ex'r.*

NEW YORK, *May 7th*, 1889—12 m.

Met pursuant to adjournment.
Present: Counsel as before.

Deposition of the witness JOHN C. TOMLINSON, who having been duly sworn, in answer to interrogatories by Mr. WALTER K. GRIFFIN, deposes and says:

1 Q. What is your name, age, residence and occupation?

A. John C. Tomlinson; 33; 128 West Twenty-seventh street, New York city; lawyer.

2433 2 Q. During the year 1887 what was your relation and connection with the Edison Company, and with a certain suit pending in the southern district of New York, wherein The Consolidated Electric Light Company was complainant, and The Edison Electric Light Company and others were defendants?

A. I was the solicitor of record for the defendants in the suit referred to, and was counsel for the electric light company, in charge of all its patent litigations.

3 Q. Did you have during the year 1887 certain interviews with William H. Church in relation to certain alleged information possessed by him as to the invalidity of the Sawyer-Man patent at present in suit?

A. I did.

4 Q. Did you at the termination of those interviews prepare or dictate a memorandum of certain of the occurrences which took place during those interviews, and of the statements of yourself and Mr. Church?

A. I did.

5 Q. How soon after the termination of those interviews was that statement dictated by you for preservation?

A. Within a day or two.

6 Q. Was that statement dictated in the presence of Mr. Dyer or not?

A. It was dictated in the presence of Mr. Dyer.

7 Q. Had Mr. Dyer been associated with you in these interviews with Mr. Church?

A. Yes.

8 Q. I hand you the paper marked for identification "Tomlinson's statement as to Church, May 6th, 1889," and ask you whether that is the statement which you dictated and to which you have referred?

A. I have examined the paper shown me, and I recognize it as the statement which I dictated and to which reference has been made.

9 Q. Please state in your own way, refreshing your memory if you so choose from the memorandum referred to, the course of the various interviews that you and Mr. Dyer had with Mr. Church.

A. I was introduced to Mr. Church by Mr. Richard N.
2434 Dyer in my office at 40 Wall street. Mr. Church, in presence of Mr. Dyer and myself, stated in substance that he was in possession of information which he considered important, and which, in his judgment, would show that the Sawyer-Man patent on fibrous material was invalid; that in so far as any invention had been made, the invention was the sole invention of Mr. Sawyer, and was made prior to his association with Mr. Man. He stated that proof of this existed in certain drawings and papers which were in the possession of one Mr. Schuyler. He further stated that the Sawyer and Man patents were taken out in the names of Sawyer and Man jointly at the suggestion of Mr. Man, in order to deprive one Flanagan of an interest which Flanagan had in Sawyer's inventions growing out of a contract between Flanagan and Sawyer. He further said that Mr. Man, in his (Church's) presence, upon his (Man's) attention being called to this Flanagan contract, stated that the only way that Sawyer could get over the obligations of this contract was by Sawyer and Man taking out patents jointly. He stated also that the Flanagan interest under this Flanagan con-

tract he (Church) could acquire and turn over to parties desiring to purchase it. It was also at this interview that I said to Mr. Church, "If what you say be so, how do you reconcile your present statements with the testimony given in the interference"? He replied in a general way that in giving his testimony in the interference he had been guilty of considerable exaggeration, and had, perhaps, testified to matters which, on further recollection, he believed he was mistaken in. I asked him in substance what he wished done, what proposition he had to make. He replied that he considered the information which he possessed to be of great value to the Edison Company, and that if he could verify his statements they ought to be willing to properly reimburse him. I endeavored to get Mr. Church to speak more in detail and specifically as to the nature of his information and proof and specifically as to what points he now considered his testimony in the interference was in error.

He rather evaded this, and said that he had informa-
2435 tion which he would not disclose until some arrangement
had been made satisfactory to himself. As a reason for not disclosing this, he stated that if we were once in possession of this information his usefulness would cease and we could act independently of him. I repeated my former question, asking what proposition he had to make. He stated that he thought $5,000 in cash would be fair, and $10,000 in the event of the Edison Company being successful in the suit. Subsequent to this interview I called on Mr. Schuyler with Mr. Church and Mr. Dyer to see the drawings and papers which Church had said Schuyler possessed. I was shown by Mr. Schuyler some photographs of alleged incandescent lamps. Whether at this interview with Mr. Schuyler, or whether previously or not I fail to remember, but at about this time I was shown a copy of the Flanagan contract. I do not remember Mr. Schuyler showing me any other papers than the photographs of the drawings to which I have referred. At about this same time (and I may here remark that Mr. Church called at the office three or four times at about the time of the first interview to which I am referring), Mr. Church gave me a printed copy of the record of the interference between Sawyer and Man and Keith and Maxim. Also written copies of the agreements between Sawyer and Man dated March 19th and May 11th, 1878; also a copy of the agreement between Sawyer, Smith and Flanagan, made January 2d, 1877. Mr. Church also prepared a statement of facts relating to this general subject which I believed at the time to be in his handwriting, which was not signed by him. From the time of my first interview until about June 30th, Mr. Church called a number of times at my office to ascertain if I had come to any conclusion in regard to availing myself of his proposition. To all of his inquiries I replied that I had not had time to go into the matter fully, which was the case, as I was very busy with other matters. About June 24th or 25th I saw Mr. Church at my office and told him there was no need of his coming every other day, but if he would

leave his address I would write or telegraph him when
2436 I could take the matter up. On June 27th, I began the cross-examination of Mr. Albon Man, and on or about June 28th telegraphed Mr. Church to call upon me the following morning at 11 o'clock. He did call and I had quite a long interview with him in the presence of Mr. Dyer in my office. Prior to this call I had considered the proposition of Mr. Church, and in the interview to which I am now referring, I stated to him in substance, that I did not think the Edison Company could accept his proposition; that they would be very loath to place themselves in the position of purchasing testimony and I considered that his proposition practically was that they do this. I stated further that if we availed ourselves of his services any arrangement that we made with him would have to be stated in full on the record, and that I doubted if a court would place much reliance upon testimony procured in this way; that the practical effect of his testimony would be that his prior testimony would be exaggerated or mistaken, or to put it plainly, false, and that a court would be very loath to believe a witness who confessed to having made such a serious mistake on a prior examination. I stated to him that the Edison Company were very desirous of having the truth appear and of the real facts, whatever they might be, coming out; that if he had committed an error previously I thought it his duty to correct it at the present time, but that he should not be urged to the performance of this duty by any pecuniary consideration. I added that if his services to the company involved the expenditure of time I had no doubt that the Edison Company would be willing to compensate him for the time which he actually spent. I stated to him that I would advise the company to do so. I remember remarking, "We pay experts $50 or $100 a day for their testimony and for their time and I do not know but I would advise the company to pay you about that amount." Mr. Church made very little response to this proposition but said in substance, "I feel so confident of the value of my information that I would be willing to make the greater part of my compensation contingent on the Edison Com-
2437 pany's success in the suit." He said, "Instead of paying me $5,000 down, as I originally proposed, I will take $2,500 down and $15,000 in case of success." After he had made this proposition I tried to get from him specifically just what this information was which he seemed so confident would defeat the patent. He declined giving it to me and would only talk in a general way as I have before indicated. I remember taking a copy of the record in the interference and going over his testimony and trying to get him to point out specifically just where he had been in error. He rather avoided doing this, but in one or two instances he stated that he now recollected that his testimony as given was incorrect. I asked him how he explained the giving of this testimony. He replied, "Well, I had a good many conversations with Mr. Man and with Mr. Broadnax, and they would say to me, 'Well, now, Church, don't you remember being here and seeing this?' and they were so persistent that I finally said, yes, I did remember it;

but now that I come to think it over, I think I was mistaken." I believe at this interview I made him a proposition of this character; I said, "Suppose we give you a small amount down, and you write out a truthful statement of the facts without consultation with me or anybody else. I don't care whether they make for us or against us. I merely want to know the truth. I might advise the company to pay you a small amount (I think I said $250); then if I determine to use you we will pay you $50 a day, or possibly I might be able to get you $100 for every day you are actually employed; but you must be prepared to have this whole arrangement explained on the record preparatory to your testimony." He neither accepted nor refused this proposition, but said, "Well, perhaps you had better see your company and ask them what they think of my second proposition—$2,500 down, and $15,000 in case of success." He left me, promising to call on the 1st of July, at 11 o'clock. He called on July 1st, and left a letter for me, which letter I believe I now have, but I did not see him. Such is my general recollection
2438 of my interviews with Mr. Church. Mr. Dyer was present at all of them, and that I might remember in the future just what occurred I was very careful when my memory was fresh to dictate in the presence of Mr. Dyer in order that I might make no mistake, the statement which has been produced, and which I now have before me, and by which I am refreshing my general recollection.

10 Q. Were those interviews induced or brought on to your knowledge by any act of yourself or Mr. Dyer, or were they the unsolicited act of Mr. Church?

A. They were entirely the unsolicited act of Mr. Church. He came with a proposition which he wanted us to accept.

11 Q. You have stated that Mr. Church called repeatedly between the first interview and the interview at the end of June at your office. Did he come at your suggestion or request, or unsolicited and of his own accord?

A. He came unsolicited and of his own accord and always to know what I was going to do with reference to his proposition. I may add he was quite persistent, he came every three or four days, so much so that I felt a little annoyed and suggested that there was no need of his coming so often, but that when I wanted him I would let him know, and I obtained from him his address for that purpose.

12 Q. Did you or Mr. Dyer or, so far as you are aware, any one connected with the Edison Company ever offer Mr. Church $1,000 a day for his services?

A. No, sir.

13 Q. Did you make any offer to him of any kind for his services except as you have already stated in your testimony?

A. No, sir.

14 Q. Did Mr. Church ever demand from you and did you refuse a demand for $60,000 for the interest in the Flanagan contract?

A. He never made such a demand and never having made it, I never refused it.

15 Q. Did he ever make you any demand except as you have stated?

2439 A. No, sir.

16 Q. I call your attention to the R. X Q. 100 to William H. Church, and ask you to state whether the answer of the witness Church to that question is true in whole or in part.

Objected to on the ground that there was no cross-examination of the witness Church.

A. I have read the answer referred to, and Mr. Church is in decided error in several particulars. Referring to his first statement that we declined to purchase the Flanagan contract on the ground that "it was of no value to them," I will say that he did make reference to the Flanagan contract, but I never considered seriously the purchasing of it. His statement that we requested him to engage in our service in trying to defeat the patent in suit, is incorrect. I never requested him to engage in the service of the company. The suggestion that he could be of doubtful service to us in view of his previous testimony was mine, not his. I did produce a printed record of his testimony in the interference and interrogated him in regard to it, as I have stated, and he answered as I have stated. His statement that we would hire him and pay him $1,000 a day is entirely wrong. The suggestion of paying him by the day I have previously explained in my answer to question No. 9. The interference record to which I am now referring is the interference record between Sawyer and Man and Edison. It is not the one which he brought to me. That was the record in what we call the Maxim-Keith interference.

17 Q. I hand you a copy of the interference record in the interference proceedings of Sawyer and Man and Edison of the patent in suit and call your attention to the deposition as there printed of William H. Church as the same is offered in evidence as part of the deposition of William H. Church in this suit, and ask you whether you can now remember which of the questions and answers of Mr. Church in that interference record you called to his attention.

2440 A. I remember calling his attention to question and answer 31 at fol. 515, as follows: "31 Q. Please to state when it was that you first saw these different forms of carbon made of paper. A. It was the latter part of February or the 1st of March, 1887." I remember asking him about that, and he said he did not know of his own knowledge that they were paper but that he gave that testimony because they afterwards told him that they were and tried to prod his memory and they were very persistent and he was rather obliging. Then I remember calling his attention to question 39 and answer, as follows: "39 Q. State if know, how these paper carbons were made. I mean how was the paper carbonized? A. They used a small metal box; the one I recollect seeing was of sheet iron, in which there was pulverized carbon and layers of the paper in the form described, alternately placed. And then the box was closed and fastened and put into the fire. I saw this one evening at Mr. Man's house. He came out of his private laboratory, showing me the box and explaining what he was doing. I subsequent saw him bring to the shop one morning a box, which he said he had left in the fire all night, and which he could not get open. It was subsequently opened by one of the workmen, but not in my presence. I, however, saw the carbons after they had been taken out of the box. I, indeed, saw these same carbons treated in oil, being put in oil and a current of electricity being run through them. This decomposed the oil and made a deposit of carbon upon the carbons already made, making them very tough, and making them of a greyish color." Referring to this answer he stated in substance that he now thought he was mistaken in his recollection of these things; that he had confounded what had been told him by others with what he had seen himself and that his present memory was, that instead of seeing these things he had been told them.

18 Q. Did he tell you who had told him?

A. He always mentioned Mr. Man and Mr. Broadnax.

2441 19 Q. Did he say anything to you as to Mr. Man giving him memoranda of facts?

A. Yes. He said that prior to his testimony in the Sawyer-Man-Edison interference Mr. Man would give him memoranda containing statement of facts and would say to him: "Church, you must recollect thus and so," and that when he came to testify he would recollect.

20 Q. Did he state whether this occurred in any cases where he did not recollect the facts here set forth in the memoranda?

A. He stated generally that his own recollection was very meagre and that in giving his testimony he was practically coached and that the testimony that he did give was the result of this coaching rather than of his own recollection.

21 Q. Will you please continue with your references to the matters in the interference record which you brought to his attention?

A. Yes, I called attention to questions and answers 56 to 61 inclusive, on pages 140 and 141 of complainant's exhibits in this case now before you, as follows:

"56 X Q. Referring now as to what you have testified about the making of paper carbons in the shop on Centre street during March, April and May, 1878, did you yourself see any of the forms illustrated in Exhibit No. 1, cut out of paper? A. Did not see them cut, but seen them after they had been cut. 57 X Q. What kind of paper did they appear to have been cut from? A. I should say out of white blotting paper. I did not handle them, but merely saw them; according to my opinion they were blotting paper. All may not have been of blotting paper, for what I know. 58 X Q. Did you yourself see any of these forms put into a box for carbonization, and afterwards taken out of the same box in a carbonized condition? A. I saw the pulverized carbon, which I understood was to go into the box; and I saw the paper which was to go in the box; and I saw the paper after it had been taken from the box; but didn't see a paper put into the box and the 2442 box heated, and carbon taken from the box. 59 X Q. Do you know, of your own knowledge, that you saw at any time at the shop at Centre street, any carbonized paper conductor for an electric lamp? A. Yes; I saw pieces of carbon formed of paper of Figs. 1, 2, 3 and 4, Sawyer Exhibit No. 1, tried in Centre street, during the *the* experiments made there. 60 X Q. How do you know those were formed of paper? A. I saw some of them formed entirely with the plumbago put upon it and stretched across and fastened to the conductors and carbonized in the lamp. In giving a former answer (to cross-question 58) I referred particularly to Figs. 5 and 6, which were never carbonized in a lamp on account of their shape. Figs. 2, 3 and 4—particularly 3 and 4, did not rest upon my mind, as I regarded them as experiments which were not successful. 61 X Q. Please state what the first instance was of your own knowledge that a paper carbon conductor of the character of 5 and 6, Exhibit No. 1, was used in an electric lamp. A. To my knowledge in December, 1878, and not far from the middle of December."

He stated that he now recollected that he could not be sure as to whether the carbon he was referring to were made either of paper or of blotting paper; that he now recollected that he had not seen these blanks put into the box and carbonized; that he now recollected that he had not seen pieces of carbon formed of paper put into lamps and tried. I will add that in going over Mr. Church's deposition with him I directed his attention particularly to those portions of his deposition where he had referred to seeing paper or fibrous material used as the incandescent conductor of an electric lamp, or had seen paper or fibrous material carbonized, and speaking generally he characterized his testimony in these respects as rather what had been told by others to him than what he had actually seen.

22 Q. Please look at the printed telegram, "Complainant's Exhibit Tomlinson Telegram," dated June 28th, 1887, and state whether to your recollection that is the telegram you sent to Mr. Church.

A. Yes; that is the telegram, I believe, I sent.

2443 23 Q. Was it or was it not in response to that telegram that Mr. Church had the long interview with you and Mr. Dyer, as to which you have testified?

A. It was in response to that telegram that he called and I had the interview referred to.

24 Q. At Mr. Schuyler's did you see any original drawings or what purported to be original drawings other than the photographs that you have mentioned in your testimony?

A. My recollection is that I only saw photographs.

25 Q. Was this interview after the sending by you of the telegram the last interview which you had with Mr. Church?

A. I believe it was.

26 Q. About how many interviews had been had before that time?

A. If by interviews you mean to include the number of times Church called at the office and I saw him I should say 15 or so, but those interviews were mostly limited to his asking me if I had come to any conclusion, and my saying, "No, better call again," or something of that general character.

27 Q. Then, as I understand you, after your first interview with Mr. Church, when you were introduced to him by Mr. Dyer, there was no interview of any length other than the calls of Mr. Church until this long interview after you sent the telegram?

A. Such is my recollection; yes.

28 Q. Is then the answer of Mr. Church to the 143d X Q. true?

Same objection as before.

A. It is not.

29 Q. Similarly the answers of the witness Church to X Q. 150 to X Q. 153, inclusive, are they true?

Same objection.

A. Mr. Church's testimony, to which you refer, is incorrect.

2444 30 Q. I call your attention to Mr. Church's answer to Re-X Q. 102. Does that answer truthfully represent the attitude of yourself and Mr. Dyer in your negotiations or interviews with Mr. Church?

Same objection.

A. It is not at all a truthful statement of the facts. There was no scheme on our part, but, as I have explained, Church was a stranger to me and came with a proposition of his own, which, as I have also explained, I never accepted.

31 Q. Similarly are Mr. Church's answers to Re-X Q. 103 and 104 truthful statements of the facts?

A. It is an incorrect statement. Mr. Church did propose that we pay him $5,000 in cash and $10,000 in the event of success.

32 Q. As matter of fact was his offer predic-ted upon the proposition that you should show him wherein he could be of service to you?

A. On the contrary, he came to us with the statement that he could be of service to us and made a demand for money and indicated generally in what way he could be of service, as I have stated.

33 Q. Is the witness Church's answer to Re-X Q. 115 a true statement?

Same objection.

A. It is not. I can only repeat that Church was a stranger to me, and that he came with the proposition asking a large amount of money, and, as a consideration why the money should be paid him, stated that he could furnish us with information which would cause the Edison Company to prevail in their suit.

34 Q. Did he ever tell you that he would rely upon you or Mr. Dyer to refresh his memory upon the subject?

A. He never did.

35 Q. As he states in the answer to Re-X Q. 115?

Same objection.

2445 A. He never did.

36 Q. Are the answers of the witness Church to X Qs. 174 to 178 true or false?

Same objection.

A. The answers referred to are untrue.

37 Q. As a matter of fact did Mr. Church inform you substantially that within 15 minutes he would put you in the way of obtaining information which would destroy the patent at present in suit?

A. He did, and he made a distinct statement of 15 minutes.

38 Q. As a matter of fact did he or did he not tell you that if he put you in possession of this information he could not be protected, and that you would be no longer dependent upon him?

A. He made that statement very distinctly.

39 Q. As matter of fact did he or did he not offer the statement in my last question as a reason for declining to give you the information unless you acceded to the terms of his proposition as to the payment of $2,500 down and $15,000 in event of success?

A. He distinctly stated that he withheld the information for his own protection, explaining that if we were once in possession of it we could act independently of him, and that was why he wanted the money first.

40 Q. You have referred to the statement prepared by you within a few days after the cessation of the interview with Church. Does or does not that statement as dictated by you set forth the truth as to your interviews with Mr. Church according to your recollection at the time the statement was dictated?

A. The statement truthfully sets forth the facts as I remember them at the time the statement was dictated, and I dictated the statement immediately after the interviews, in order that I might, while the subject was fresh in my mind, put down in definite shape exactly what had occurred. I believe the statement is true
2446 in every particular, for I was very careful in the dictation of
it to have Mr. Dyer present in order that I might commit no error.

Defendant's counsel offers the said statement in evidence, and the same is marked "Defendant's Exhibit Tomlinson Statement as to Church, May 7th, 1889, W. T. F., special examiner."

Cross-examination by Mr. BROADNAX:

41 X Q. At Mr. Church's first interview with you, did he make any proposition of sale to you or the Edison Company of the so-called Flanagan contract?

A. He referred to the Flanagan contract as a piece of property which he did not own. He made no proposition regarding its sale, but stated that the Edison Company could acquire it, Flanagan's interest, if they desired it.

42 X Q. Did he name any price at which they could acquire it?

A. He did not.

43 X Q. But I understand you the substance of your interviews with Mr. Church was embraced in your first and last interviews with him?

A. That is my general recollection.

44 X Q. And your last interview you say occurred after the sending of the telegram to him?

A. Yes.

45 X Q. Now, when did he respond to that telegram; the telegram is dated on the 28th of June?

A. I cannot remember the date, but it was very soon after.

46 X Q. Was it before or after his letter was left at your office dated July 1st, 1887?

A. My impression would be that it was intermediate the telegram and the letter, but it is only an impression.

47 X Q. Do you recollect of seeing Mr. Church upon this matter at all after you received that letter?

2447 A. My recollection on the sequence of dates is not very clear. My impression would be that I did not see him after the letter.

48 X Q. What time in the day did the interview occur?

A. That I cannot answer. Probably between 11 and 4.

49 X Q. You are sure that it did not occur before 11?

A. No, I am not.

50 X Q. Is the copy of the letter that Mr. Church produced and that is printed here as an exhibit a true copy of the letter received from you by him?

A. I do not know. I received a letter from him, and it ought to be among my papers. I can hunt it up if you wish.

51 X Q. I wish you would do so and please to produce it.

A. I will.

52 X Q. Please to read Mr. Church's letter or the copy of it put in evidence by complainant's counsel, and explain, if you can, what it means.

Objected to because Mr. Tomlinson is not the proper person to explain the letter which he did not write.

A. I can theorize about it and my theory is this: that Mr. Church had become satisfied that we would not accept his proposition, and in terminating the interviews he made the statement contained in the letter for the purpose of showing in the future what was not the fact, that the discussions between him and myself had related solely to the Flanagan interest. That is my theory in regard to the letter.

53 X Q. Does the letter not express or convey to your mind a true understanding of what has occurred between you and Mr. Church in the several interviews?

A. It does not.

54 X Q. Wherein is it misleading?

2448 A. It is misleading in this: It would convey the impression that the subject-matter of our interviews related solely to the purchase of the Flanagan interest, as it refers to that and that alone; whereas the fact is that the Flanagan interest was very little referred to, and other matters, as I have explained, consumed the greater part of the time.

55 X Q. Is it not true that the discussion or negotiations about the Flanagan contract was disposed of before Mr. Church stated to you, or offered to you for a consideration, to furnish facts which he thought would defeat the patent in suit?

A. Such is not my recollection. My recollection is that all the matters to which Mr. Church has referred were referred to at different times throughout our interviews, a greater time being devoted to some than others.

56 X Q. Is it your recollection that Mr. Church was to sell you the Flanagan contract and furnish you the pretended information, all for the consideration of $5,000 in cash and $10,000 contingent?

A. It never reached that definite point. His reference to the Flanagan interest was general, and to the effect that we could acquire it, and in stating as his reasons why so large an amount of money should be paid him, he would enumerate the Flanagan contract, the early work of Sawyer-Man's joint inventorship with Sawyer as a subterfuge of overcoming the Flanagan interest; the incorrectness of his former testimony and this other important matter, which he could not disclose.

57 X Q. He was to put it all in for a lump sum, as you understood it?

A. As I say, it never reached that point. This was his proposition in a general way and it never got beyond it.

58 X Q. I do not now clearly understand whether Mr. Church separated the Flanagan contract as a property for you to purchase from the information which he proposed to sell you for the $15,000. What I want to know is whether Mr. Church in the first instance offered to sell you for any consideration at all the Flanagan contract, and if so, for how much.

2149 A. I have, I think, answered your question. I have said that Mr. Church put no distinct price on the Flanagan contract as a separate piece of property. I have explained that Church asked money not for Flanagan but for Church, and that the consideration which would come to the Edison Company for the payment of this money would be not acquiring an interest in Flanagan's contract, but the defeat of the Sawyer-Man patent, and he enumerated several elements which either separately or together would result in the defeat of that patent, and mentioned the Flanagan contract as one of them. I am unable to answer your question more fully.

59 X Q. Referring to the statement of facts which you say Mr. Church furnished you and which is not signed by Mr. Church, did you understand that to be an original statement written by Mr. Church, or a copy made by him from some paper in the possession of Mr. Schuyler or somebody else?

A. I doubt if I can answer your question. It was a statement of facts which he furnished me. I understood the writing to be his. Whether the facts were stated from his own recollection, or furnished him by somebody else, or whether the paper was a copy of a paper that had been prepared by somebody else and copied by him I cannot say. I do not remember as I ever tried to understand anything about that.

60 X Q. After you had got through your interviews with Mr. Church what conclusion did you reach in your own mind as to Mr. Church's motive in making you the several propositions he had made you?

Objected to as immaterial, the sole issue being as to the actual facts that took place and not the opinion of any one.

A. I thought he wished to make a large sum of money quite easily.

61 X Q. Do you recollect whether or not at the time that these negotiations were in progress you were engaged in the cross-examination of Albon Man?

2450 A. I think it quite likely I was cross-examining him in some case.

Counsel for complainants states upon the record that he desires the examination to be suspended at this point until the deposition can be written out, the deposition having been taken in phonography and the counsel is unable to conduct the cross-examination without a copy of it, and desires an adjournment until Wednesday, May 8, 1889, at 1 p. m.

Counsel for defendants wish to say upon the record that they have every desire to facilitate counsel for plaintiffs, providing it is not at the risk of their own rights and standing; that they will attend at the time named but that the witness is now tendered by them for a completion of his cross-examination.

Adjourned to May 8th, 1889, at 1 p. m.

New York, *May 8th*, 1889—1 p. m.

Met pursuant to adjournment.
Present: Mr. Broadnax, Mr. Griffin.

Examination of the witness, John C. Tomlinson, continued:

By Mr. Broadnax:

62 X Q. Have you brought with you the letter you received from Church dated July 1st, 1887?

A. I have not. I have looked for it and cannot find it.

63 X Q. Please to state upon the record whether or not
2451 you are now in the service of the Edison Electric Light Company.

A. I am not.

JOHN C. TOMLINSON.

Sworn to before me—

W. T. FARNHAM, *Spec. Ex'r.*

Defendant's counsel asks leave to state of record that on account of the illness of Mr. Edward N. Dickerson during all the time since the day fixed by consent for his examination, and the consequent orders of his physicians prohibiting his appearing or attending to any business, as appears by a letter submitted for perusal of complainant's counsel, it is impossible to take his examination, as wished and intended.

The following is the paper offered in evidence by defendant's counsel which was referred to by the witness Tomlinson and the witness Dyer, and which was marked "Tomlinson Statement as to Church, May 6th, 1889, W. T. F., special examiner."

Statement of John C. Tomlinson as to His Acquaintance with Mr. William H. Church.

My acquaintance with Mr. Church is as follows: I was introduced to him by Mr. Richard N. Dyer some months ago. Mr. Church stated that he was in possession of some important information which would show that the Saw-er-Man patent on fibrous material was entirely invalid; and that so far as any invention had been made, it was the sole invention of Mr. Sawyer, and was made prior to his association with Mr. Man. This he claimed to be able to prove by drawings and papers in the possession of Mr. Schuyler. He also stated that the contract between Sawyer and Man, by 2452 which they became joint inventors, or was stated to have been joint inventors, was made by Man to defraud one Flanagan of his interest in the Sawyer inventions, which Man knew at that time to have been perfected, and in which Flanagan was entitled to an interest. He stated that Mr. Man, in his presence, when he was shown the Flanagan contract, said that the only way to get over Sawyer's obligation to Flanagan was by Man and Sawyer taking out the inventions jointly.

I saw Mr. Schuyler with Mr. Dyer and Mr. Church, but had no conversation with him beyond his producing photographs of these alleged drawings.

Mr. Church was desirous of making an arrangement with the Edison Company by which they should pay him a large amount, provided he furnished testimony that would defeat the patent. His terms were $5,000 in cash, and $10,000 in the event of success. This $5,000, he stated, was necessary to reimburse him for the loss which he would sustain, as he was a stockholder in the Consolidated Company, and he felt obligated to reimburse Mr. Schuyler and some other gentlemen they had. At about the time of my first interview with Mr. Church he left with me a printed copy of the record in the interference between Sawyer and Man, and Keith and Maxim; also copies of agreements be- W. E. Sawyer and Albon Man, dated respectively March 19th and May 11th, 1878; also a copy of an agreement between Sawyer, Smith and Flanagan, dated January 2d, 1877; also a statement of facts in the handwriting of Mr. Church, but not signed.

From the time of my first interview until about June 30th, Mr. Church called a number of times at my office to ascertain if I had come to any conclusion in regard to procuring his testimony and services. To which I invariably replied, in substance, that I had not had time to go into the matter.

About June 24th or 25th Mr. Church called, and I told him there was no need of his coming again until I could take the matter up. He left me his address and asked me to telegraph him.

2453 On June 27th I began the cross-examination of Mr. Albon Man; and on June 28th I telegraphed Mr. Church to call upon me the following morning at 11 o'clock. He did and Mr. Dyer and myself had a long interview with him in which we stated in substance that we did not wish to be in the position of purchasing testimony or doing anything that was improper. We could not use him, and would not use him without stating if we put him on the stand just what our arrangement was, and how it came about. That he would have to state that his prior testimony was false if his present story was true, and that this would place him in a very bad position. Mr. Church stated in substance that his prior testimony was false, but that he had been led and influenced to give it by Mr. Man and Mr. Broadnax. He stated that prior to his testimony in the interference, Mr. Man dictated to him memoranda of what he, Man, had done, and tried to impress Church with the fact that he, Church, had seen it; and that he, Church, being interested in the success of Sawyer and Man at that time, in testifying as to what he was, and knew was in fact merely stating what had been told him by Man; that he did not have at that time, and does not now have any recollection of having seen the things which he testified concerning. We stated to Mr. Church that our company would be very reluctant to make any such arrangement as that proposed; that we considered it was his duty to tell the truth, whatever the truth might be, whether for us or against us. That all I thought could probable be done, would be to pay him reasonably for such time as he might devote to testifying or procuring evidence. He then made a counter-proposition to the effect that we pay him $2,500 down, and $15,000 in case of success, stating that he was willing to leave the much larger amount as a contingency, as he was entirely confident of success. We replied we cannot know the value of your testimony or information until we know what it is. He was reluctant to tell us what his knowledge was, except in regard to his prior testimony, and the question of joint inventorship, as once in possession of the information he could not be protected, and he intimated that 2454 in 15 minutes he could put us in the way of gaining information which would destroy the patent, and that once knowing this we would no longer be dependent upon him. We then asked if this proposition would be satisfactory; pay him so much down to tell us the truth, whatever it might be, and then if we decided to avail ourselves of his services to pay him reasonably for the time he devoted to it. He did not accept or refuse this proposition, but said, "Ask your company what they think of my original proposition," and he left promising to call July 1st, at 11 o'clock.

He called July 1st, but I did not see him. He left a letter for me which I now have.

This statement was dictated in the presence of Mr. Dyer who concurs in the statement made.

COMPLAINANT'S EXHIBIT PENNY ENCYCLOPEDIA EXTRACT.

The Penny Encyclopedia, of the Society for the Diffusion of Useful Knowledge, published at London in 1840, vol. 17, p. 207.

Paper. * * * The art of making paper from fibrous material reduced to a pulp in water appears to have been first discovered by the Chinese about the year 95 A. D. In the time of Confucious they wrote with a style of bodkin, on the inner bark of the bamboo. The Chinese paper has been supposed to be made of silk, but this is a mistake; silk by itself cannot be reduced to a pulp suitable for making paper. Refuse silk is occasionally used with other things, but the greatest part of the Chinese paper is made from the inner bark of the bamboo and some other trees, but chiefly from the bamboo. * * * Only the second skin of the bark of the bamboo is used, which is beaten into a pulp with water.

COMPLAINANT'S EXHIBIT CHAMBERS ENCYCLOPEDIA EXTRACT.

Chambers' Encyclopedia, published at London in 1878, vol. 1, page 654.

Bamboo (bambusa), a genus of grasses, of which most of the species attain a great size, many of them 20 or 30 feet, some 70 or 100 feet in height. The species are numerous, and are found in tropical and subtropical regions, both of the eastern and western hemispheres. They are of great importance to the inhabitants of the countries in which they grow. All of them have a jointed subterranean root-stock (rhizome), which throws up 10–100 stems. These are generally straight and erect; although one large species (*B. agrestis*), common in dry mountainous situations in the
2456 southeast of Asia, has crooked, and sometimes creeping stems.
The stems grow to their full height unbranched, but afterwards throw out straight horizontal branches, especially in their upper part, forming a dense thicket; and many of them being strongly armed with spines, they are planted for defence, presenting a formidable barrier, even against regular troops. Some of the smaller kinds are often planted as hedges. The stems are jointed like those of other grasses, very hard, but light and elastic, hollow, containing only a light spongy pith, except at the joints or nodes, where they are divided by strong partitions. They are, therefore, readily converted into water vessels of various sorts; and when the partitions are removed, they are used as pipes for conveying water. They are also much employed for house-building, for bridges, &c. The smaller stems are converted into walking sticks, and are imported into Europe under the name of B cane, both for that purpose and to be employed in light wicker work. In China, the in-

terior portions of the stem are used for making paper. Some of the species grow to the height of only a few feet: and almost all of them are slender in proportion to their height, although *B. Guadua*, a native of New Granada and Quito, has a trunk 16 inches in diameter. The stems of different species vary also very much in the thickness of the woody part, and so in their adaptation to different purposes. The external covering of the stem is, in all the species, remarkably silicious; the stem of *B. Tabacaria* is so hard that it strikes fire when the hatchet is applied. This species is a native of Amboyna and Java; its slender stems are polished, and used for the stalks of tobacco pipes. The leaves of some kinds are used for thatch, and the Chinese plait hats of them; of the external membrane of the stems of some, they make paper. From the knots of the B. there exudes a saccharine juice, which dries upon exposure to the atmosphere, and which the Greeks called Indian honey. It is also sometimes
named tabaris or tabasheer: but this name more properly
2457 belongs to a phosphorescent substance, containing silica and
lime, and possessing remarkable properties, which forms in
the joints of some species of B., and of other large grasses growing in dry situations. See Tabasheer. The young shoots of some kinds of B. are eaten like asparagus, or are pickled in vinegar. Those of *B. Tulda*, a common Bengalese species, are used for these purposes when about 2 feet long. The seeds of some species are used as rice, and for making a kind of beer. Bamboos are generally of very rapid growth, and they are often found in arid situations, which would otherwise be destitute of vegetation. It is not improbable that they may yet be employed, where they do not naturally abound, to render districts productive which are now little else than deserts, in climates like those of Arabia, the north of Africa, and Australia; and the quality of the grain of different species seems to deserve more attention than it has ever received. The species common in the West Indies (*B. vulgaris*) is supposed to have been introduced from the East Indies. A few species are found in the Himalaya, to an altitude of 12,000 feet, and a dwarf species from that region has been successfully tried in the open air in England.

2458 COMPLAINANT'S EXHIBIT REES' ENCYCLOPEDIA EXTRACT.

Rees' Encyclopedia, American edition, published at Philadelphia prior to 1880, vol. 3, article Arundo.

There is perhaps no plant used for such a variety of purposes as bamboo. In the East Indies great use is made of it in building, and the houses of the lower class of people are almost entirely composed of it. Bridges are also made of it, masts for their boats, boxes, cups, baskets, mats, &c. Paper is also made of it by bruising and steeping it in water, and thus forming it into a paste.

Vol. 27, article Paper.

The preparation of paper made of the barks of trees, may be instanced in that of the bamboo, which is a tree of the cane or reed kind. The second skin of the bark which is soft and white is ordinarily made use of for paper.

(*Translation.*)

The Chinese cook it until it reaches the consistency of broth, and make with it a fine variety of paper for the use of pictures and parasols.

Vol. 15, p. 255.

The Other Different Kinds of Paper.

Chinese paper.

The Chinese appear to have been since immemorial antiquity in possession of the art of paper-making. The materials which they use seem to vary with each province. Some use linen rags as in Europe, others the young bamboo, the mulberry tree, the skin which is found in the cocoons of silk worms, a tree unknown to our botanists but which they in this empire call chee or ko-chee, tow, and especially cotton tree.

The Societe d'Encouregement has for a long time offered a prize to any one who should succeed in perfectly imitating Chinese paper. It has felt the importance of this discovery in order to relieve our industry from a considerable tax which we pay to a foreign country for the supply of this paper, indispensable as it is for copper-plate and lithographic engravings.

There can be seen at the "cabinet des estamps" a collection of Chinese paintings representing the manufacture of bamboo paper. One of the paintings represents the bamboo paste, which after being triturated, ground and boiled is set to ferment under mats.

2460 COMPLAINANT'S EXHIBIT ENGINEERS' AND MECHANICS' ENCYCLOPEDIA EXTRACT.

The Engineers' and Mechanics' Encyclopedia, &c., &c., by Luke Hebert, C. E., etc., etc., published at London in 1849, page 139, under the title Bamboo.

Bridges, boats, masts, rigging, agriculture and other implements and machinery; carts, baskets, troughs, pipes for conveying water, pumps, fences for gardens and fields; tables, chairs, bedsteads, beddings, barrows, fences, sacking, cordage, oakum, candle wicks, whips, etc., are made of it.

Macerated in water it forms paper; the leaves are generally put round the tea sent to Europe; the thick inspicated juice is a favorite medicine.

COMPLAINANT'S EXHIBIT NICHOLSON'S ENCYCLOPEDIA EXTRACT.

Nicholson's Encyclopedia, Am. edition, published at Philadelphia in 1819, vol. 2, article Bamboe or bambou.

Paper is also made from it by bruising it and steeping it in water and thus forming it into pulp.

Vol. 9, article Paper.

Chinese paper is of various kinds; some is made of the rinds or barks of trees especially the mulberry tree and elm, but chiefly of the bamboo and cotton tree. In fact, almost each province has its own paper. The preparation of paper made of the barks of trees may be instanced in that of the bamboo, which is a tree of the cane or reed kind. The second skin of the bark, which is soft and white, is ordinarily made use of for paper; this is beat in fair water to a pulp, which they take up in large moulds, so that some sheets are about twelve feet in length.

2461 COMPLAINANT'S EXHIBIT ENCYCLOPEDIA OF CHEMISTRY EXTRACT.

Encyclopedia of Chemistry, published at Philadelphia in 1880 by J. B. Lippincott & Co., article entitled "Paper from bamboo," on pages 533 and 534.

Paper from bamboo.—The following information relative to the manufacture of pulp from bamboo is derived from a paper published in 1876 by Mr. Routledge, who, it should be added, was the introducer of esparto as a material for making paper. He is of opinion that this new material will prove as superior to esparto as that is preferable to straw, and he proposed the following process kind. The second skin of the bark which is soft and white is ordinarily made use of for paper.

Encyclopedia of Chemistry, published at Philadelphia in 1880 by J. B. Lippincott & Co., article entitled "Paper from bamboo," on pages 533 and 534.

Paper from bamboo.—The following information relative to the manufacture of pulp from bamboo is derived from a paper published in 1876 by Mr. Routledge, who, it should be added, was the introducer of esparto as a material for making paper. He is of opinion that this new material will prove as superior to esparto as that is preferable to straw, and he proposed the following process of manufacture: The young and fresh-cut stems having been passed through heavy crushing rolls, are passed through a second series of rolls, which are channelled in order to thoroughly split and partially divide them, when they are cut into suitable lengths by any convenient means, and delivered to the boiling pans. Both the boiling and washing processes are conducted in a series of pans similar to Coupier's boilers already described, and the lye of caustic alkali can thus be re-employed until exhausted; and when the extractive matter contained in the fibre is rendered sufficiently soluble, the washing is proceeded with in a similar manner, hot water being employed. The mass, having been rinsed with cold water, is drained in presses, and placed in a "devil" or "willow;" here it is thoroughly "teased" out, and assumes a tow-like appearance. After this has been dried by a blast of hot air, it is packed in bales for exportation, and only requires to be bleached and mixed with other stuff, or worked by itself, according to the nature of the paper required. The bamboo thus treated yields as much as 60 per cent. of its weight of fibre.

The inner bark of the bamboo has long been used by the Chinese for the manufacture of paper of excellent quality, which is celebrated for the clear and delicate impressions, called India proofs, which it takes from engraved plates.

2462 COMPLAINANT'S EXHIBIT MUSPRATT'S CHEMISTRY EXTRACT.

Chemistry, Theoretical, Practical, &c., by Dr. Sheridan Muspratt, published at London, Glasgow, and New York, vol. 2, page 642.

Very little information can now be obtained of the invention and early progress of the art of paper-making. The earliest accounts do not agree, either as to date or place; but all point to the east as the seat of the discovery, leaving almost no doubt that the principle of the mode-n art of reducing vegetable fibre to a liquid state is a Chinese invention. * * *

The paper produced resembles what is commonly called flimsey, but takes a finer and more delicate impression from copper plates and is known by the name of India proofs. A small quantity of it is used in this country for the finest engravings. It is generally made of the inner bark of the bamboo and cotton tree.

Pages 165, '6.

A COURSE OF SIX LECTURES

ON THE

VARIOUS FORCES OF MATTER AND THEIR RELATIONS TO EACH OTHER

BY

MICHAEL FARADAY, D. C. L., F. R. S.,

Fullerian professor of chemistry, Royal institute,

Delivered before a juvenile auditory at the Royal Institution of Great Britain during the Christmas holidays of 1859–'60. Edited by William Crookes, F. C. S. With numerous illustrations.

Second edition.

London and Glasgow: Richard Griffin and Company, publishers to the University of Glasgow.

MDCCCLX.

Let me now show you what are the properties of that light which make it useful for light-house illumination, and which has been brought to a practical condition by the energy and constancy of Professor Holmes. I will first of all show you the image of the charcoal points on the screen, and draw your attention to the spot where the light is produced. These are the coal points. The two carbons are brought within a certain distance; the electricity is being urged across by the voltaic battery, and the coal points are brought into an intense state of ignition. You will observe that the light is essentially given by the carbons; you see that one is much more luminous than the other, and that is the end which principally forms the spark, the other does not shine so much, and there is a space between the two which, although not very luminous, is most important to the production of the light. Dr. Tyndall will help me in showing you that a blast of wind will blow out 2464 that light; the electric light can in fact be blown out easier than a candle. We have the power of getting our light where we please; if I cause the electricity to pass between carbon and mercury I get a most intense and beautiful light, most of it being given off from the portion of the mercury between the liquid and the solid pole. I can show you that the light is sometimes produced by the vapor between the two poles, better if I take silver than when I use mercury. Here is the carbon pole, there is the silver, and there is a beautiful green light which comes from the intervening portions. Now that light is more easily blown out than the common lamp, the slightest puff of wind being sufficient to extinguish it, as you will see if Dr. Tyndall breathes upon it.

COMPLAINANT'S EXHIBITS EXTRACT FROM MULLER'S PHYSICS.

Page 376.

PRINCIPLES

OF

PHYSICS AND METEOROLOGY.

BY J. MULLER,
Professor of physics at the University of Freiburg.

Illustrated with 530 engravings on wood, and two colored plates.

London: Hippolyte Bailliere, publisher, 219 Regent street.
Paris: J. B. Bailliere, 13 Rue De L'Ecole de Medecine, 1847.

If we fasten to each of the poles of a galvanic circuit, pointed pieces of carbon (of the kind and size used in the carbon cylinders of Bunsen's battery), we shall, as soon as these points come into contact, perceive an uncommonly glittering light. This bright light can be seen by a Bunsen's battery of only four elements: a small, brightly luminous star appearing where the points 2465 of the charcoal come into contact with each other. By increasing the number of the elements, the splendor of the appearance considerably increases; and thus, in a circuit consisting of from 30 to 50 elements, we may obtain a light far exceeding in brightness Drumond's hydro-oxygen light. By the application of this number of pairs of plates, we may remove the points of the pieces of carbon tolerably far from each other, if only the current passes, and we may thus obtain a splendid bow of light, formed by the glowing particles of the charcoal which pass from one pole to the other.

The Telegraphic Journal and Electrical Review for May 15, 1874, Pages 202 and 203.

The new electric light.

On the evening of the 5th inst., some interesting experiments with MM. Ladyguine and Kosloff's electric light were conducted at the engineering works of Messrs. Warner, 10 Diana place, Eastern road. To obviate the difficulty of carbon being consumed when burnt in contact with oxygen, M. Ladyguine placed sticks of carbon in a closed glass chamber filled with a gas not containing oxygen, but owing to the use of metallic connections the carbon was subject to a fracture. The subject was then taken up by M. S. A. Kosloff, of St. Petersburgh, and 6 Great Winchester St. buildings, London, who has succeeded in overcoming the difficulties by using a special metal of which he forms the holders for the carbon rods, and these are placed in a closed glass chamber.

The lamps which were experimented with were nine in number, six of them having two carbon rods, either of which could be placed in connection with the current of electricity. The rods were all
18 millimetres in length, and one in each lamp was 2 milli-
2466 metres in thickness, the others being 1¾ millimetres thick.
The other three lamps contained each a carbon rod 70 millimetres in length, 2 millimetres thick, and also connected with the main current. The first experiment consisted in burning a carbon rod in contact with the atmosphere, the rod being consumed in a few minutes. The current was then turned on to the thicker rod in each of the six lamps, and a brilliant and steady light was produced, which improved as the current was increased in intensity. The reason for lighting the thicker rod first was that it might consume the oxygen in the lamp, by which the rod was reduced a quarter of a millimetre, and was thus brought down to the gauge of the second rod. The current was then directed through the second rod with equally satisfactory results in all the six lamps. The three lamps with the longer carbon rods were then lighted and successfully exhibited, changes being frequently made from the six to the three lamps and back again. The apparatus used for producing the current was Gramme's magneto-electric machine. With the machine running at about 200 revolutions per minute a moderate light was obtained, which was greatly improved at 300 revolutions, the maximum of intensity being obtained at 450 revolutions. The strength of the light depends upon three things—the power of the machine and the number of its revolutions, on the length and thickness of the carbon rods, and on the quality of the carbon. The experiments showed that with the same strength of current and the same number of revolutions, double the amount of light was obtained with the three long carbon rods as compared with the six short ones. The experiments demonstrated satisfactorily the fact that the electric current could be subdivided, and hence, if practice confirms experiment, which it is believed it will, there is a wide field open for the application of Kosloff's system. The form of lamp used by the inventor is experimental, and its variation does not affect the principle. He leaves it to mechanical science to devise a lamp
which shall meet the varied requirements of light-houses,
2467 mines, submarine works, railways and other purposes, to
which it was the general opinion of those present on Tuesday the principle is thoroughly applicable.

COMPLAINANT'S EXHIBIT PHILOSOPHICAL TRANSACTIONS No. 1.

Philosophical transactions of the Royal Society of London for the year 1874, published at London in 1874, pages 513 and 514.

37. I now wished to see the effect of applying to the gravitating masses a hot body inside the exhauted balance tube instead of outside, and accordingly constructed an apparatus shown in Fig. 4.

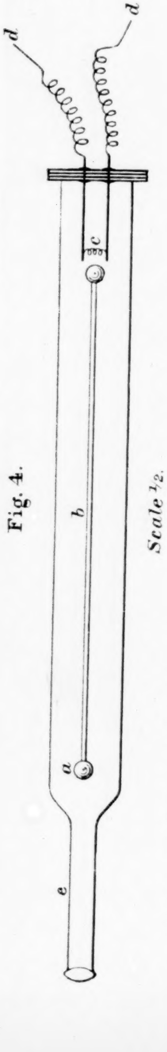

Fig. 4.

2468 *a b* are two balls suspended on a straw beam; *c* is a platinum spiral fastened to two stout copper wires cemented into holes drilled through a plate of glass, which can be cemented to the end of the tube; *d*, *d* are the battery wires; *e* is the extremity of the tube, drawn out for attachment to the Sprengel pump. A single Grove's cell served to heat the platinum spiral to redness. By careful management and turning the tube round the necessary degree, I could place the equipoised brass ball either over, under, or at the side of the source of heat. A contact key enabled me to heat the spiral without removing the eye from the micrometer. With this apparatus I wished to learn more about the behaviour of the balance during the progress of the exhaustion, both below and above the point of no action, and also to ascertain the pressure corresponding with this cal point.

In air of ordinary density the action of the hot spiral was one of attraction both above and below. Not wishing, however, to complicate the action by air currents, I exhausted with the Sprengel pump until the gauge stood about 40 millims. below the barometer. I then tried the following experiments:

2469 38. The brass ball was placed so that its position when in equilibrium was about 1 millim. above the spiral, and the latter was rendered incandescent. The ball was immediately drawn down to the spiral, sometimes touching and then rebounding with considerable force.

39. The brass ball was then arranged so that it was about 1 millim. below the spiral. On turning on the battery current the ball rose to the hot platinum. This latter action might be due to air currents; but it is difficult to imagine that air currents could drag the ball down to the hot spiral when the latter was beneath it (38).

40. The ball was arranged so that the platinum spiral was opposite the end, but a little above, as shown in Fig. 4 A. On igniting the spiral the movement was very slightly upwards. When the spiral was rather below the ball, as shown in Fig. 4 B, the ball moved downwards when contact with the battery was made; the tendency in each of these cases was to bring the centre of gravity of the brass ball as near as possible to the source of heat.

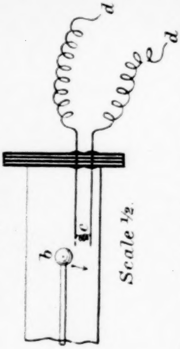

Fig. 4 B.

41. The pump was then worked until the gauge had risen to 5 millims. of the barometric height. On arranging the ball above the spiral and making contact, the attraction was still strong, drawing the ball downwards a distance of 2 millims.

The pump continuing to work, the gauge rose until it was within 1 millim. of the barometer. The attraction of the hot spiral for the ball was still evident, drawing it down when placed below it, and up when placed above it. The movement was, however, much less decided than before, and in spite of previous
2470 experience (30, 31) the inference was very
strong that the attraction would gradually diminish until the vacuum was absolute, and that then, and not till then, the neutral point would be reached. Within 1 millim. of a Sprengel vacuum there appeared to be no room for a change of sign.

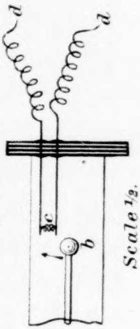

Fig. 4 A.

42. The gauge rose until there was only half a millimetre between it and the barometer. The metallic hammering heard when the rarefaction is close upon a vacuum commenced, and the falling mercury only occasionally took down a bubble of air. On turning on the battery current there was the faintest possible movement of the brass ball in the direction of attraction.

43. The working of the pump was continued. On next making contact with the battery, no movement of the ball could be detected. The red-hot spiral neither attracted nor repelled. I had arrived at the critical point. On looking at the gauge I saw it was level with the barometer.

44. The pump was now kept at full work for an hour. The gauge did not rise preceptibly; but the metallic hammering increased in sharpness, and I could see that a bubble or two of air had been carried down. On igniting the spiral, I found that the critical point had been passed. The sign had changed, and the action was faint but unmistakable repulsion. The pump was still kept going, and an observation was taken from time to time during several hours. The repulsion continued to increase. The tubes of the pump

were now washed out with oil of vitriol,* and the working was continued for an hour.

2471 45. The action of the incandescent spiral was now found to be energetically repellent, whether it was placed above or below the brass ball (Figs. 4 c, 4 d). The finger exerted a repellent action, as did also a warm glass rod, a spirit flame, and a piece of hot copper.

INTRODUCTION

TO

CHEMICAL PHYSICS,

Designed for the use of

ACADEMIES, HIGH SCHOOLS AND COLLEGES.

Illustrated with numerous
Engravings.

And containing copious lists of experiments with directions for preparing them.

BY

THOMAS RUGGLES PYNCHON, S. T. D., LL. D.,

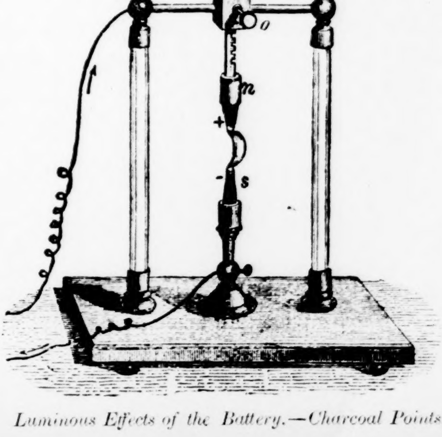
President of Trinity college, Hartford.

Second revised and enlarged edition.

New York:
D. Van Nostrand, 23 Murray and 27 Warren street.
1877.

355. Luminous effects.—All combustible substances, whether solid or liquid, such as ether, alcohol, phosphorous and gunpowder, may be inflamed by passing the galvanic current through them.

FIG. 159.



Luminous Effects of the Battery.—Charcoal Points.

A platinum wire, several yards in length, can be made to glow with intense brilliancy; and the effect is greatly increased if the wire be wound into the form of a spiral helix. Oxygen and hydrogen gases; also, hydrogen and chlorine, are combined by the spark, with a bright flash and loud explosion. When pieces of well-burned charcoal are attached to the wires and become the poles of the battery, on bringing them near each other a most brilliant arc of flame, emitting the brightest artificial light known, flashes between them. The compact coke of gas retorts is better adapted to this purpose than any other form of charcoal. The points 2473 must be brought near each other and then gradually separated. Fig. 159, *a* is the positive pole, *b* the negative. As they are drawn apart by the rack and pinion the light and flame still continue, assuming the form of a curved arc. If the different metals are placed in this flame they are volatilized at once and pass off in fumes. So intense is the light that it may be used in optical experiments in place of the light of the sun. The luminous effect is found to be increased if the upper piece of carbon be made the positive, and the lower the negative pole. And if the two carbon points are arranged in a horizontal position, at right angles to the magnetic meridian, the length of the luminous arc is said to be greater in the proportion of 20.8 to 16.5 when the positive pole is to the east than when it is to the west.

2474 Complainant's Exhibit Extracts from Pepper's Cyclopedic Science Simplified.

Pages 335, 336, 345, 346, and 347.

The Calorific Effects of the Voltaic Current.

When the poles of the battery, or rather the terminal wires, are connected with the arms of the universal discharger, to which crayon-holders, containing hard gas-retort carbon, have been attached, no effect is observed until the carbons are brought in contact, because the intensity of the voltaic current is not sufficient to polarize the intervening air and cause a disruptive discharge; but, once brought in contact, a brilliant spark or intense light is perceptible; and then the carbons may be more or less separated without interrupting the current; and with very powerful batteries, the distance between the two carbons may be increased to several inches.

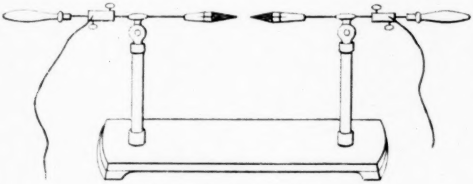


Fig. 303.—*The Charcoal Points.*

By throwing a picture of the charcoal poles on the disc it is seen that a luminous arc extends between the two poles, and there is a constant transference of heated particles going on between the two carbons. It is this passage of divided carbon which serves as a conductor to the current, and preserves its continuity.

De la Rue states that "The length of the luminous arc consequently bears a close relation to the facility with which the material of the poles admits of division."

2475 Scientific men have always agreed that the transference of particles in the same direction as the current, viz., from the positive element to the negative; and the explanation is made clearer by the discovery of Neeff, that the positive is more strongly heated than the negative pole.

Van Breda has shown that incandescent and fused particles are not only propelled from both poles towards one another, but in every direction.

Maas, of Namur, affirms that the transference does not always take place from the positive to the negative pole, but is determined by the density of the charcoal. He states that he succeeded in reversing the direction of the particles by connecting a very hard, fine-grained bit of carbon with the positive, and a coarse, soft piece of charcoal with the negative; and he then found that the incandescent particles moved from the negative to the positive pole.

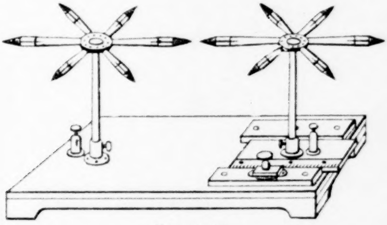

FIG. 304.

The negative cylinder, when examined, appeared slightly excavated; the positive one, slightly obtuse. Amidst this conflicting evidence, the writer states from experience that the wasting of the charcoal points is always unequal, and, provided they are of the same quality, the transference takes place regularly from the positive towards the negative. By arranging a number of
2476 crayon holders, containing various metals, such as zinc, copper, lead (Fig. 304), according to the method proposed by Mr. De la Rue, a number of beautiful colors may be obtained by the intense heating and partial combustion of the metals, copper throwing out a green light, zinc a bluish white, with the formation of a large quantity of smoke—oxide of zinc.

If the charcoal points are brought together in a void space, or vacuum, the light is very peculiar, it appears softer, though still very brilliant, and presents a marked difference to the same light observed in air; the carbons appear to last much longer, and the writer has often thought that when the electric light is required to be very continuous, as in the Duboscq lantern, it would always be better, if possible, to produce the light in small glass chambers from which the air had been removed.

The Electric Lamp.

The young people who may read this book, will no doubt, be glad to hear that they can now experiment with the electric light at a very moderate cost, with a new and beautiful apparatus constructed by Mr. John Browning, of 111 Minories.

The apparatus, Fig. 312, is most simple and effective, and with a small Grove battery and a moderate-sized lamp, an electric light may be procured at about the cost of two or three pounds. There is no clock-work; and the regulator is simply an electro-magnet which cannot very easily be put out of order. The writer can strongly recommend this apparatus to those who want a cheap and good lamp. Of course, when an electric lamp is required to
2477 be constantly used, and is subjected to much wear and tear,
more substantial arrangements are required, as in Serrin's lamp.

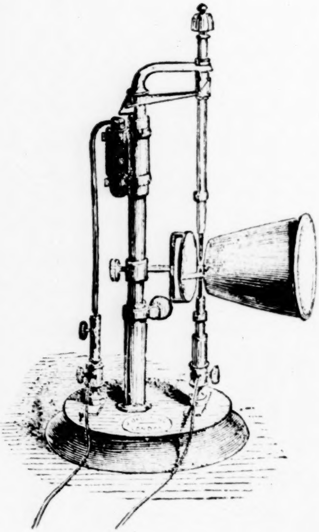

Fig. 312.—*Mr. Browning's New and Cheap Electric Lamp.*

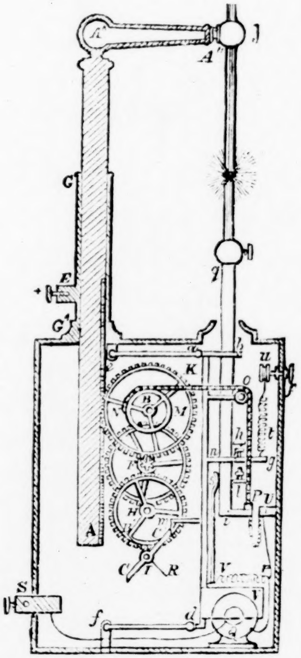

Fig. 313.—*Serrin's Automatic Regulator of the Electric Light.*

In the following description of Serrin's apparatus, Figs. 313 and 314 represent a vertical section and plan (at the height of the electro-magnet) of apparatus; it consists,

First, of a motor or driving power A, A′, A″, forming at the same time the motor and holder of the positive electrode, as a motor; it
is furnished with a toothed rack, and acts by weight on the
2478 moving part of the clock-work. The tube G, G′, serves as a
guide, which carries a binding screw-stud E, which serves to
receive the wire from the positive pole of the battery.

Secondly, of a wheel train, composed of four movable parts, B, F, H, I, the first mover of a single piece forming at the same time a toothed wheel K, and pulley M. The diameter- of these last are as two to one, so as to correspond and be in proportion, as near as may be, to the different consumption of the positive and negative carbon points, and thus maintain the point of light stationary. To effect this, the wheel K, in turning under the action of the motor, A, A′, A″, allows the upper carbon point to descend, whilst the pulley M, by the same movement, winds up the chain N, O, P, and effecting at the same time the ascension of the lower carbon point. The toothed wheel K, in combination with the other movable parts, serves to regulate the approach of the carbon points by the aid of the flyer R, R′, which carries the last wheel. This carries besides a detent C, C′, which acts to prevent or permit the approach of the charcoal points.

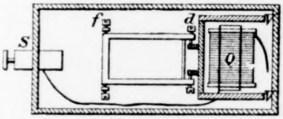

FIG. 314.

Thirdly, of an electro-magnet, Q, wound round with an insolated conducting wire, communicating by one of its extremities to the binding stud S, and by the other to small chains, U, P.

Fourthly, the combination of parts, which I will term the oscillating arrangement, and which forms the particular feature of this improved regulator; *a*, *b*, *d*, oscillating support, properly so called,
which is held by two arms of equal length, *a e*, *d f*, jointed,
2479 at *e f*, to the plates or case of the train; the joints, *e f* and *a*
d, permit of a vertical to-and-fro movement of about half an
inch, which movement is limited by a stop, *g*, oscillating between two screws, *h*, *l*.

The pulley O, which is mounted on the oscillating support and disposed to receive the chain, N, O, P. I call this chain and pulley O, the parts of ascension. The pawl or catch *m*, also fixed to the oscillating support, engages with or disengages from the teeth of the detent C, C′, according as it is to be raised or lowered, thus, when the stop *g* is in contact with the screw *h*, the gearing is free; if, on the contrary, it separates itself a fraction of an inch, the pawl *m* engages with and stops the train: *a*, *b*, *n*, *n'*, collars formed on the oscillating support; they are bushed with ivory, so as to isolate the lower carbon-holder, and serve at the same time to guide the latter in its raising movement.

The armature V, fixed to the oscillating support, is formed of a horizontal plate and two vertical plates of soft iron; the horizontal part covers the electro-magnet Q, and the other two are placed at opposite ends of the soft iron of the electro-magnet, but without touching it. This armature is disposed in such way that its central horizontal line is higher than the usual lines of the electro-magnet, thereby assisting the action of the magnet.

The appendix *i*, P, fixed to the base of the carbon-holder, *i*, *q*, serves to join it with the chain, N, O, P, electrically isolated at P.

The object of the small chains U, P, is for the passage of the electric current, while at the same time they serve as a variable counter-balance by raising the extremity P, and thereby compensating for the loss of weight that the lower carbon incurs by being used in combustion. The fixed support U, of the chains is electrically isolated. The friction surface S, V, is also isolated at V, the helix A, R, serving also to conduct a part of the electric current passing from the lower carbon to the wire of the bobbin.

2480 The suspension spring has for its object to sustain the oscillating frame and effect of the weight; it can be lengthened or shortened at will by the aid of the button *p* and pulley *u*.

Action of the regulator.—The drawing represents the apparatus in action and the carbon points about half used. The carbon points are placed in their supports A'', *q*, while the apparatus has no communication with a battery; the electro-magnet being inactive, the spring *t*, should be lengthened in such way that the stop *q* presses lightly on the screw *h*, or in this case the detent C', C'', being in gear with the hook *m*, is raised to its highest elevation. During this *this* time the gearing is free, and the charcoal points approach and come in contact. By connecting the negative pole of the pile or battery to the binding stud, S, and the positive pole to the screw E, the electricty enters the apparatus by the latter, passes through the motor, carbon-holder, and the carbon itself by reason of the contact which exists between the two carbons; it will continue its course by the lower carbon, the support, *i*, *q*, the small chains, P, U, also the friction surface, *s*, *r*, and helix *r*, *r*, to the conductor wound on the electro-magnet, leaving by the binding screws-tud, S, to reenter the battery, and so on. At the moment of connecting the second pole of the battery, the electro-magnet becomes active, and the armature, V, is attracted and drawn down, thus lowering the oscillating frame or system; the hook then catches the wheel train. By this action the train is stopped and the upper carbon remains stationary, while the lower one being unable to rise, their separation is maintained, and the voltaic arc formed. The arc being formed the carbon points are consumed by transfer and combustion; therefore the interval between them increases, while the attractive force of the bobbin becomes gradually weaker, and the oscillating system raises, its motion being complete when the screw-stud *g*, touches the screw *h*, the train liberated at the same time and acts on the ascending parts, which thus effect the si- 2481 multaneous approach of the two carbons; this approach is effected in relation to the unequal wear of the carbons so as to maintain the point of light stationary. After the approach of the carbons the electricity passes more easily, causing the armature to be attracted more strongly and to overcome the resistance of the suspending spring so as to draw down the oscillating frame, when the hook gears with the train and prevents the carbons approaching until the wear again produces another approach, followed by another stop, and so on. Thus, by the alternate opening and closing of the circuit, the movement described can be reproduced and continued at pleasure, and so forming and determining the voltaic arc by its self-action. After the preceding, it will be seen that it is the oscillating system or frame which determines all the actions of the regulator, and separation and adjustment of the carbons. The seven principal pieces of which it is composed produce the different effects under the action of electro-magnetic apparatus in communication with the voltaic arc.

COMPLAINANT'S EXHIBIT PHILOSOPHICAL TRANSACTIONS NO. 2.

Philosophical Transactions of the Royal Society of London for the year 1876, published at London in 1877, sections 171 to 177, inclusive, on pages 350 to 352.

171. But in case of light falling on the lamp-blacked surface the result is very different. Here, practically, the whole of the light is quenched by the lamp-black. Force is poured into the bulb, but none comes out. What, then, becomes of it? It is changed into motion, and becomes evident in the strong repulsion which is exerted on the black surface.

This I think is clear in the case of light. We can see that 2482 there is an enormous difference in the absorbing powers of white and black pith for light, and we can also see that there is an equally marked difference between the motive power which light exerts on them. But with the heat from boiling water or from a hot copper ball our eyes cannot tell us whether the same difference obtains or not, and we must use other and less direct means of finding out what takes place.

Let me direct attention to the experiments described in paragraphs 128 and 144. Here red-hot copper was seen to repel the black surface with violence, and the white surface only moderately. As the copper ball cooled, the repulsion on each surface became more nearly equal. At 400° C. the differential action was decided, though faint. At 300° C. the black surface was still repelled slightly more than the white surface, but at 250° C. down to 100° C. the repellent action of the radiant heat was the same on the white as on the black surface. The two surfaces were then thermically of the same color.

The fact that the work done on each surface was equal, is, I think, proof that the absortion of the incident rays was equal.

172. Let me now carry the reasoning a step further. Experiments described in pars. 159 to 168 show that when heat of low refrangibility—from the body (159), the breath (160), hot air, or a warm glass shade (161, 165, 168)—falls on the white and black surfaces, the white is repelled more than the black, rotation of the radiometer taking place in the negative direction. The same rays falling on the two surfaces do more work on the white than on the black; and this, to my mind, appears sufficient to make it almost certain that the white pith absorbs more of these low rays than does the lamp-black.

173. Let us imagine that surfaces of lamp-black and pith are carried along the spectrum from the blue to the ultra red. As long as they are in the visible portion we observe an enormous difference between them. In the extreme red we can actually see that 2483 this difference is becoming less. In my mind's eye I picture the progress being continued along the whole length of the ultra-red spectrum. I can see, by the light of the above-quoted experiments, that the absorptive action of the two surfaces gradually gets more equal. Soon they become identified in their action on the incident rays, and after that they enter a portion of the spectrum whose rays are no longer absorbed by lamp-black, whilst they are quenched by the pith. Lamp-black and pith have now changed places; the latter is black, whilst lamp-black has become a white substance.

174. The normal rotation of the radiometer caused by dropping ether on it (163) is perfectly well explained by the above hypothesis. If heat in the act of absorption produces motion in one direction, in the act of radiation, it produces motion in the opposite direction (167). Heat of low refrangibility falling on the radiometer repels the white more than it does the black, and produces negative rotation. When the same kind of heat is drawn out of the black and white surfaces by the chilling action of the ether, movement takes place in an opposite direction, and the arms rotate normally. On stopping this efflux of heat by covering the instrument with a hot shade (163), I changed the direction of movement by causing the surfaces to absorb instead of emit heat.

An irregular emission or absorption of heat (164) stops the movement altogether, for the reasons given in pars. 155 to 158.

175. I have made an apparatus by means of which I hoped to put the above theory to accurate test. The results are not so defi- 2484 nite as they ought to be in order to settle the question; but they are worth giving in detail, as some novel facts have been elicited by them.

Fig. 10.

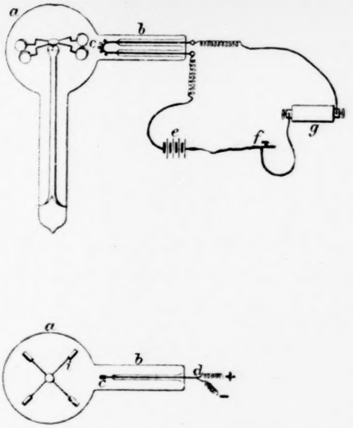

Fig. 10 shows the instrument: *a* is the bulb of a radiometer of the usual construction, having pith disks blacked on one side. *b* is a tube sealed into one side of the bulb, and having two stout platinum wires passing along it, sealed their whole length in glass to prevent leakage of air into the interior of the apparatus. At the ends *c* of the wires, a spiral of fine platinum wire is fastened, and the other ends (*d*) terminate in loops outside. *e* is a battery, *f* a contact key, and *g* a resistance coil, which I can vary at will. The bulb was perfectly exhausted, and the following experiments were tried:

176. The resistance coil was so adjusted that the battery would keep the platinum spiral (*c*) at a bright red heat. The arms of the radiometer, which were before quite still, moved rapidly until two of the disks were one on each side of the hot spiral, the black disks being further off than the white disk, as shown at *i*. The
2485 resistance was then gradually increased, and as the temperature of the spiral diminished, the black disk gradually approached the spiral, until when the temperature was just at the point of visible redness in a dark room, the black and white disks were practically equidistant from the spiral. On diminishing the resistance, the same phenomena took place in inverse order.

177. The resistance was adjusted to give a bright red spiral, and the contact key kept pressed down. The disks stood as at *i*. A lighted match was momentarily brought near the bulb, so as to start a movement. Rotation of the arms commenced, and kept up with some energy, at the rate of about one revolution in five seconds equal to that given by a candle 8 inches off. There was some little hesitation as the white side came up to the spiral, but this was scarcely noticed when the speed had become steady.

The resistance was slightly increased. The speed became slower as the temperature of the spiral diminished, and the hesitation as the white approached the spiral became more apparent. The resistance was further increased with the effect of making rotation still slower. I now brought the temperature of the spiral down to just vis*a*ble redness in the dark. The speed of rotation again slackened; at each approach of the white surface to the spiral it stopped, hesitated, and then got past with a rush. Thus it went on for a few revolutions, until one white disk, a little nearer perhaps than the others, was not able to pass, and the arms after a few oscillations came to rest, the black and white surfaces being, as near as I could judge, equidistant from the hot spiral.

These results fully confirm those obtained in experiments 128 & 144, and I think justify the conclusions arrived at in my discussion of them at par. 171—that at temperatures between 250 and 100 degs. the repellent action of radiant heat is about equal on black and on white surfaces.

1864.

(Pages 413, 414 and 416.)

280. Disruptive discharge—Electric light.—When the current is greater than the conductor is able to convey, the wire melts and is dispersed in vapor: dis*p*ruptive discharge, in fact, occurs. From a powerful voltaic battery this disruptive discharge may be maintained continuously, owing to the enormous quantity of electricity in circulation.

If the air be rarefied between the interrupted conductors, the interval through which the discharge can be effected may be considerably increased. Thus the heat developed by the passage of the current between two pieces of charcoal when they are in cont*r*act, will enable them to be separated for a considerable distance without interrupting the passage of the current; this distance ranges from ¾ inch to 1 inch when a series of seventy of Daniell's

cell twenty inches in height are employed. Davy, with the great battery of the Royal institution, consisting of 2,000 pairs of
2487 plates on Wellaston's construction, obtained an arc of flame,
between charcoal points, four inches in length, and of dazzling brilliancy.

Despretz, by using 600 cells of Bunsen's construction arranged consecutively, succeed- when the points were placed in a vertical line with negative pole below, in obtaining an arc of 7.8 inches in length. With 100 pairs the arc was only one inch long. The most intense light, however, is obtained when the points are separated but to a small distance, because the resistance then being less, a much larger quantity of electricity passes in a given time, and the temperature is proportionately higher. Despretz found he obtained a much more intense light by employing his 600 cells in six parallel series, so as to form 100 cells of six times the ordinary size, than when they were connected into one continuous series. He estimated the light with the arrangement of 600 in six parallel series to be nearly six times as great as when 100 cells only were employed—a result in conformity with the anticipations of theory. The same observer found that when the charcoal points were disposed in a horizontal direction at right angles to the magnetic meridian, the length of the arc when 200 pairs of Bunsen in two parallel series were employed, was greater in the proportion of 20.8 to 16.5, when the positive pole was to the east, than when it was to the west.

During the production of this dazzling light a considerable mechanical transport of the materials composing the terminals of the pile takes place, and there can be no doubt that the ignition of the solid particles contributes mainly to the production of the intense light thus produced. A cavity is always produced in the piece of charcoal attached to the positive wire which is connected with the last platinum or copper plate of the battery; and at the same time a mammillated deposit, which continually increases in length, is formed upon the charcoal on the negative wire in connection with
the zinc plate. Attempts have been made to apply this light
2488 to the purposes of illumination, and in particular cases, as for
the display of optical phenomena in the class-room, it is often of high value. Its application is, however, attended with great practical difficulties, of which the transfer of conducting material from one pole to the other is one of the most serious; and it is very doubtful if, even when the mechanical obstacles are removed, such a light can be economically or advantageously used for the general purposes of illumination. The light is too intense for the unprotected eye to endure for any length of time in its immediate vicinity, and the expense is so great, that unless the electricity can be obtained in the process of preparing some chemical compound in the battery itself which will defray the cost of production, its success as a mercantile speculation is very problematical.*

* The general appearance of the electric lamp of Duboscq is shown in Fig. 223, in which T. T. represent the charcoal points between which the voltaic arc is maintained. The object to be effected

is to preserve these points at a uniform distance from each other, and at the same height in the lantern, so that the source of light shall always be kept in the same position with respect to the lens.

The regulator by which this result is attained is shown at R.
Within this is an electro-magnet, and a clock movement, the
2489 principal parts of which are represented upon a larger scale
in Fig. 224. The clock movement is designed to bring the

FIG. 223.

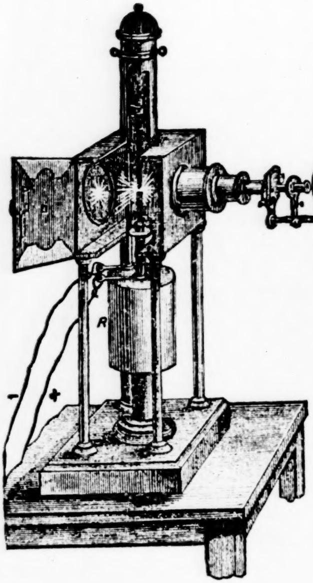

FIG. 224.

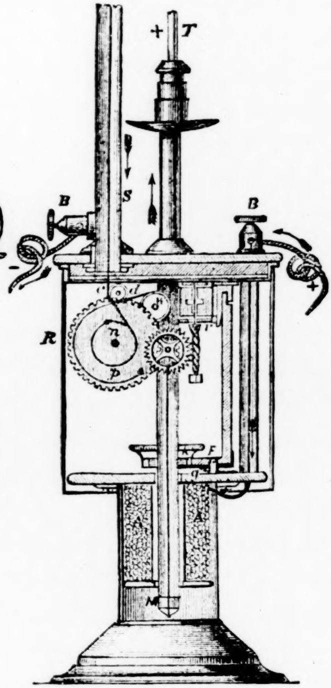

two points toward each other so as to compensate for the waste they experience in burning, and the electro-magnet is employed to check the clock action when no longer needed. When the battery is in use the negative point is always consumed in air more slowly than the positive one; and it becomes necessary to provide means for moving each point, at a rate proportioned to the rapidity of its consumption. This is effected by making the drums *n* and *p* of un-
equal dimensions; the chains *c* and *d* are employed to trans-
2490 mit the movements of the clock-work to the points T, T′.
The chain *c* attached to the upper or negative point T′, is coiled upon the smaller drum *n*, and passes up the tubular support *s*. This chain is wound in the opposite direction to that of the

chain *d*, which after passing over the pulley *d'*, is attached to the tube containing the lower or positive charcoal point T. Both drums are placed upon a common axis, and therefore both are moved by the clock in the same direction, so that whilst the chain *d* attached to the lower point is being wound up, the chain *c* connected with the negative point is being un*un*wound, though less rapidly than *d*, and the negative point is allowed to descend. The wires from the battery (about 40 pairs of Grove) are made fast to the binding screws B B', the positive wire B, being connected with one end of the coil A A of the electro-magnet M, while the other end of the coil is in electrical contact with the lower point T. The current is thus made to pass through the electro-magnet on its way to the charcoal points. When the electro-magnet is in full action it attracts the keeper *k* attached to the lower end of the bent lever working on the fulcrum F. The upper extremity of this lever, when the keeper is drawn home, locks into the ratchet wheel seen edgewise at *r*; thus arresting the clock movement, and rendering the charcoal points stationary. As soon as the distance between the points becomes too great, the current through the electro-magnet becomes reduced in power, and lets go the keeper *k*, which is forced away from the magnet by the releasing spring *q*. By this means the clock-work is immediately set free, and the points are thus made to approach each other, until the current recovers sufficient force again to attract the keeper, which once more locks into the ratchet wheel *r*. When the battery is in good action, these alternate motions of the keeper and of the clock-work recur with frequency and regularity; so that the points are maintained at a distance sufficiently uniform to prevent any sudden or material fluctuation in the amount of light.

2491 COMPLAINANT'S EXHIBIT CERTIFIED COPY OF DYER AND WILBER LETTER OF OCT. 4, 1880. W. T. F., Examiner. April 10, 1889.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE.

To all persons to whom these presents shall come, Greeting:

This is to certify that the annexed is a true copy from the records of this office of a letter from Dyer and Wilber, dated October 4th, 1880, ordering copy of file-wrapper, contents and drawing in the matter of the application of Sawyer and Man, filed January 9th, 1880, for improvement in electric lights, and containing $5.25, cost of said copy.

Copy was furnished October 16th, 1880.

In testimony whereof I, C. E. Mitchell, Commissioner of Patents, have caused the seal of the Patent Office to be affixed this [SEAL.] 2nd day of April, in the year of our Lord one thousand eight hundred and eighty-nine, and of the Independence of the United States the one hundred and thirteenth.

C. E. MITCHELL,
Commissioner.

$5.25, certified. 12 photo.
198—286

Washington, D. C., *Oct. 4th*, 1880.

Hon. Commissioner of Patents:

Please furnish us with copies of the file and contents and dr'g, in the case of Sawyer and Man, electric lights, filed January 9, 1880, now in interference with Edison.

Enclosed therefor is the cost, $5.25.

DYER & WILBER,
Att'ys for Edison.

2492 Complainant's Exhibit Lichtenstadt U. S. Patent. April 22, 1889. W. T. F., S. E.

United States Patent Office.

Philipp Lichtenstadt, of New York, N. Y.

Improvement in Preparing Fibre from the Bamboo.

Specification forming part of Letters Patent No. 41627, dated February 16, 1864.

To all whom it may concern:

Be it known that I, Philipp Lichtenstadt, of the city, county, and State of New York, have invented or discovered a new and useful process for disintegrating the fiber of bamboo, so that it may be used in manufacturing cordage, cloth, mats, or pulp for paper; and I do hereby declare that the following is a full, clear, and exact description of the same.

My invention relates to a cheap and expeditious process for disintegrating or rendering into a fibrous or pulpy state for manufacturing purposes the tissues of the bamboo, (*Bambusa* and *Bambusa arundinacea*,) whereby I gain a greater amount of comminuted material from a given quantity of the crude material than by any other process hitherto practiced for the disintegrating of woody or vegetable substances of the character of bamboo.

To enable others skilled in the art to make and use my process I will proceed to describe the same.

In the reduction of vegetable substances to a fiber for manufacturing purposes a great object heretofore has been to destroy all the woody matter and only preserve the cellulose or cellular tissue. This process is expensive, and causes great loss in a fiber which may be utilized with great advantage and economy, so that while heretofore but from thirty to forty per cent. of the crude vegetable substance was saved in a fibrous or pulpy state fit for manufacturing
purposes I actually save by my process eighty-five per cent.,
2493 and sometimes more. I first take the bamboo and cut out
the joints thereof, and then split up the pieces or portions of the wood into slivers of, say, half an inch in width. The slivers or pieces are then put into a vat, say, capable of holding and treating one thousand pounds of the bamboo, where they are pickled in a solution of clear lime water, nitrate of soda, and oxalic acid. The

liquid content of the vat is about five hundred gallons, and the proportions of which the pickling liquid is made are about as follows: Of hot lime one hundred pounds: of nitrate of soda, four hundred pounds: of oxalic acid, forty pounds. The oxalic acid attacks the silica or outer coating of the bamboo plant and destroys it. It also acts, however, as a bleaching agent, and the quantity used may therefore be diminished if the fiber is not required to be bleached, as would be the case in cordage, coarse cloth, mats, and rough paper. The pickling liquid may be warmed, but not made hot enough to drive off the oxalic acid, and the material to be treated may remain in the pickle from twelve to twenty-four hours, after which it is removed and boiled in a solution of soda ash, using about two hundred pounds of soda ash to about one thousand of the material to be treated. This reduces the material to the con- — fiber half bleached. The material is then crushed between *dition of a* rolls and then "deviled," (combed, or carded, or heckled) and is then in condition to be spun into cordage, or other forms for manufacturing ropes, cloth, mats, &c., yarns. If, however, the fiber is to be used for paper-making, then it is taken to a pulping, beating, or grinding engine of any of the ordinary well-known kinds, where it is converted into a pulp and thence into paper. For the finer or whiter qualities of paper, the pulp may be bleached by any of the known processes.

Having thus fully described my process, what I claim therein as new is—

The process of separating and disintegrating the fibre contained
in bamboo by treating it with a solution of lime, nitrate of
2494 soda, and oxalic acid, and preparing the textile material for
manufacturing purposes, substantially as described.

PHILIP LICHTENSTADT.

Complainant's Exhibit Heaton U. S. Patent. April 22, 1889.
W. T. F., S. E.

United States Patent Office.

Charles Heaton, of New York, N. Y.

Letters Patent No. 68363, dated September 3, 1867.

Improvement in Preparing and Treating Vegetable Fibres.

The schedule referred to in these letters patent and making part of the same.

To all whom it may concern:

Be it known that I, Charles Heaton, of the city, county and State of New York, have invented a new and improved method of preparing and treating crude vegetable fibrous material, for the purpose of utilizing the fibre of the same to be used in the arts; and I do hereby declare that the following is a full, clear, and exact description of my method of proceeding and treatment.

Before describing my invention it is necessary, for the proper understanding of the subject, that I should make the following remarks:

2495 Bamboo, and other like large-jointed productions (which I prefer to treat by my process,) being found in hot climates, usually have to be carried from the place of their production to the place of consumption; and among other obstacles to their treatment and conversion into fibre, have the following disadvantages: When bamboo has been cut and stored away it is found to produce, in large quantities, an insect or bug of the beetle order, which seems to be taken up into the plant, in the egg form, during its growth. I have found this insect within the solid wood of bamboo, into which it has eaten long burrows, without being able to find any place where it had entered into the plant. I have also fermented bamboo, and have then found it to be full of insect life in the form of small white maggots, which may or may not be another form of the same insect brought into existence by the process of fermentation, but which certainly shows that insect life is taken up in the growth of the plant. This insect or bug is very destructive to the fibre, as well as to all wood-work adjoining the stored crude material, and also highly detrimental to the quality of paper made from bamboo, when paper is made from it. Another inherent disadvantage to bamboo as a fibre-producing material is its bulk. It is a very light and a very hard, unyielding material, and its shipment in the crude state is attended with great comparative expense. It is so light that after it has been split up and baled or pressed as much as practicable, a vessel of capacity to carry one hundred and sixty tons of ordinary freight can only carry forty-three tons of baled bamboo. Bamboo, as is well known, is a hollow structure, furnished at intervals with joints, like straw. At each of these joints there is a hard and tenacious diaphragm or partition, which prevents the material, in its crude state, from being baled solidly, unless each separate piece is put through rollers or otherwise crushed; and even after crushing it will be found to be so tenacious of its original form, and so elastic, as to go back to that form and be very hard to bale solidly. Should it be found worth while to arrange presses to bale it solidly, there is still the bug or insect before mentioned to be contended against.

2496 The object of my invention is to overcome each of these disadvantages, and to extract the fibre from such material without increasing the cost of such extraction; and to this end I place the crude material into a solution of caustic alkali of about the following proportions: To each ton of crude bamboo, dry, I propose to use and do use, two hundred pounds of hydrate of potassa (KO, HO,) of commerce, or its equivalent of soda ash, (N^aO, CO_2XHO,) which I make caustic by quicklime in the ordinary manner, and to which I add enough water to form a solution of the bulk necessary to cover the ton of bamboo to be softened. This

softening may be effected either in open tanks, and cold, or in closed vessels, and hot, the object being to soak the bamboo in the alkaline solution until it has become softened; but care should be taken, in using closed boilers and heat or pressure, not to carry the heat too high, or the material under treatment will be disintegrated and injured; as I will hereafter show. If I use closed vessels and heat, I find that in from two to three hours the bamboo has become quite soft, and that it offers no resistance to being baled. If I use an open tank instead of a closed vessel, and apply no heat, I find it takes two or three days to produce the same effect or soft condition of the material, but that in all other respects the condition is the same, namely, the crude material is reduced to a soft, yielding condition without having become disintegrated, and without having changed its conformation. In the course of from one to two days, depending on the climate, the soft material, on being taken out of the solution which softened it, becomes hard again, and with the exception of having become shrunk or shriveled up a little, and having also changed color, looks as it did before being subjected to treatment. Before this takes place, and while it is soft, I press it into bales, if I wish to transport it; and I find that with the same application of power and the same press used to bale the crude material I can easily press three times as much bamboo, which has been softened as I describe, into the space occupied by one-
2497 third the quantity of unsoftened or crude bamboo; thus enabling a vessel which would only carry forty-three tons of the crude material to carry one hundred and twenty-nine tons of prepared material, and therefore reducing the cost of transportation two-thirds. In addition to this saving in transportation, I find the insects or eggs before alluded to are all destroyed, so that the prepared material may be stored for any length of time without depreciating in its nature, and also that the absorption of oxygen, which goes on for a long time after softening, greatly facilitates the reduction to pulp or fibre, whenever it may be necessary to disintegrate it. The cost of chemical for softening cannot be taken as an offset to the saving in the cost of transportation, as the same chemical, or chemical of equal cost, would have to be used in any case to convert the crude material into fibre; the only difference being that by my method of proceeding I allow an indefinite time to elapse between the application of the chemical to soften, and the mechanical reduction of the softened material to pulp or fibre, which, in addition to enabling me to save in cost of transportation and destroy animal life, as before mentioned, also results in a great saving of chemical, because when material has been softened by an alkaline solution, it becomes greedy for oxygen, which it absorbs, so that while it is lying in store or awaiting disintegration, an action which costs nothing is going on, which renders the subsequent reduction or disintegration more easy, and also enables me to obtain a better product than I could do by any other process.

If it is required to make the material which has been softened and baled into brown paper, I simply untie the bale of prepared material and place it in a tank, tub, or other convenient vessel, and

cover it over with cold water, and allow it to remain in the same from six to twelve hours, when it swells up to its original size and becomes so soft and unresisting that it can be rubbed into fibre in the hands with ease. I now drain off the water, which has become of a dark, rich brown, or coffee color, and wash the material
2498 by causing hot or cold water to fall among it. When it is washed comparatively clean, so that the water which runs off is no longer highly colored, I transfer the material to the ordinary paper-maker's beating engine, (used in all paper mills, and sometimes called the rag engine,) and beat the fibres apart and reduce it to pulp in the same way that rags are reduced, and make it into paper in the ordinary manner.

For white paper, the material has to be treated differently, but such additional treatment forms no part of this specification.

By washing the softened material before disintegrating it, I find I avoid wasting the fibre, and get, as a consequence, a much greater yield of fibre from a giving quantity of material. I also find when paper is made, that it is better and stronger than would have been made from the same material by any other known process; and whatever may be the use made of bamboo thus softened, it will be found that the softening process to which it has been subjected will have improved its condition, and it will be found that notwithstanding the softened material becomes hard again, there is so much chemical stored up in it for future use to be made available at any time and put into energetic action by simply adding cold water. In the case of brown paper, as above shown, the material may be reduced to pulp and made into paper by mechanical action and simple cold water, without any additional chemical treatment whatever.

It is necessary for me to make some remarks, which I will make as brief as possible, in order to make quite clear what might otherwise be considered a very fine distinction but which in reality is a very broad one, and a new and novel method of proceeding.

Vegetable fibrous material had been made into paper for a long time prior to my invention, I am aware, and caustic alkaline solutions have been used for the purpose of reducing the crude material to pulp. In all cases where caustic alkali has been used, it
2499 has, I believe, always been the custom to boil such crude fibrous materials as are suitable for paper-making with caustic alkali, but such boiling has always been carried on for the express purpose of disintegrating and reducing the material treated to a pulpy mass in the boiler or vessel in which it has been boiled; and to accomplish this disintegration in whole or in part, it has been the custom to boil for very long periods, the express object being in all cases to reduce the material to a pulp, or as nearly so as possible, in the boiler, by dissolving its gums, and while the chemical which dissolves them is present. The mass of pulpy matter is then customarily transferred to the beating or rag engine, and there washed free from its dissolved gums and combined chemical solution, said engine being used as a washer and net for the purpose of reducing the material, which has always been more or less

reduced in the boiler. The object, I believe, has always been to disintegrate and separate the fibres one from the other and reduce the pulp by dissolving the gums. Patents have been taken for the combination of caustic alkali and certain high degrees of heat for the special object of reducing to pulp in the boiler and before washing the material, said washing being for the purpose of removing the dissolved gums and combined chemical from amongst the already disintegrated fibres. The ordinary beating or rag engine, which was originally designed for reducing rags, cloth, and other like fibrous substances (not crude fibre) to pulp and washing out dirt and coloring matter at the same time, being common in paper mills, has been and is used for washing such pulpy masses as are the result of boiling crude vegetable fibrous substances in caustic alkaline solutions combined with heat long applied for the purpose of disintegrating the same; and it is evident that in using the beating or rag engine for washing out dissolved gums and chemical from the disintegrated or partially disintegrated mass, the object has been to use the engine as a washer, and only as a beater or disintegrator when, from imperfection in the boiling process or from other causes, the material under treatment has not
2500 been uniformly disintegrated, as it was intended to be. My object and intention is exactly opposed to the boiling process, and I am particularly careful not to disintegrate in the boiler or while the chemical is present, as, if I did so, I should waste the fibre in washing out the chemical which reduced it, and also injure its quality by undermining its structure too much and thereby shortening its staple, as I find that where alkaline solutions are used with heat for the purpose of reducing vegetable fibre from the crude state directly to a pulpy mass, material so reduced is unfit for making into paper without the addition of some other long fibre, which has not been subjected to the same treatment, to enable the fibre to make a strong felt, a quality which alkalies and heat sufficient to disintegrate always must destroy. When I use heat I do so only as an accelerator to the softening process, for the purpose of causing the solution more quickly to permeate the pores of the material and soften it. All vegetable fibrous structures, so far as I have observed, are built up in the same order, and consist of fibres built up in series of structures. The first series, or the first natural division, consists of bunches of a second series, built up like and forming a duplicate of the plant of which it is a part. Each of these bunches is built up again of other still finer series of bunches, until, so far as I have been able to see, the very ultimate fibre, if there is such a thing, is an infinitely minute duplicate of the whole plant, and much too fine and minute to be washed by any known means without great loss in washing. All of the various substructures of which bamboo seems to be composed appear to be arranged in the same order of series below series, which are joined together by gum or gums which fill up all of the interstices without closing them. These gums are of a pithy and crystalline nature, and appear to be held together by the force of cohesion. This gum is of the same nature throughout the whole structure, which it

binds together, giving stiffness and inflexibility to the same. Cold caustic alkaline solutions readily permeate these several
2501 structures and soften the gum or gums, destroying the attraction of cohesion and rendering the whole mass soft and yielding, so that the fibres may be separated from each other and from their surrounding gums without any great exertion of mechanical force, and without injuring or breaking the fibre in the separation. But in order to dissolve these gums and separate the fibres by the chemical action and without the aid of mechanical force, heat and great heat is necessary in addition to caustic alkaline properties. But when the material is subjected to that chemical action which dissolves the gums, I find that if any, the whole of the gums is dissolved, and the material which should have been only partially disintegrated is reduced to its very ultimate fibre, its structure being so thoroughly undermined and broken up as to be unfit for anything requiring fibrous strength, and so finely disintegrated as to be lost in great proportion during the washing out of the dissolved gums. It is an axiom among paper-makers that no fibre will make good paper unless it is long enough to spin; and the reason that rags, though old and often rotton, make better paper than new fibrous vegetable matter, is because such matter is ruined by the harsh treatment to which it is subjected, and reduced so finely that it cannot be handled. Rags are not so reduced. The fibres of all rags are still perfect, undisintegrated structures or substructures, containing gums which have never been dissolved out, and therefore when they are put into the engine it is found that the action of the roll or beater disintegrates or draws out the fibres better than they can be separated by any chemical action. It is plain that if the gums among vegetable fibrous materials are of uniform nature, (and there is no reason to doubt but they are,) (and if the ultimate fibre is to- fine for manipulation or for making into paper except as a part substitute for rags, and this is generally known to be the case,) that when the necessary heat had chemical action are brought to bear, the material, if disintegrated at all, must be disintegrated to- much; that is, it is reduced to pulp too soon, because it
2502 has to be washed; and this is perhaps the reason that so far the making of paper from crude material has not been attended with perfect success. In addition to the waste of fibre which takes place when chemically disintegrated material is washed free of the spent chemical, a second great waste takes place, when white paper is made, in washing out the bleaching solution, which so decreases the yield of white pulp that it often costs much more than the rags would do which it is intended to substitute. In my method of separating crude fibrous material I do not dissolve the gums, nor do I disintegrate the material till after I have washed it. Then, if the object is to make white paper, I only partially disintegrate it preparatory to bleaching it, after which I wash out the bleach and reduce it to pulp in the beating or rag engine, using the engine as a disintegrator and not as a washer, by which means I avoid all waste and produce a better material at a less gross cost; that is to say, I treat a given quantity at a less expense and obtain a greater

quantity of fibre than by a chemically reducing process would be possible, as I do not reduce the material to pulp until all the manipulation is over, and when I have reduced it to pulp I convey it to the paper machine in the water in which it was beaten to pulp, while by all other methods of proceeding the material is boiled into pulp or sought to be so, then placed in the engine to wash it, not to disintegrate it, because it is already disintegrated too much.

I am aware that beating engines have been and are used for washing material which has been previously disintegrated or partially disintegrated by boiling. I am also aware the beating engines are and have been used for further disintegrating rags, cloth, hemp, tow, bagging, &c., which cannot be considered crude fibre, being already to a certain extent disintegrated. I do not claim the use of a beating engine for either of these purposes. But I am not aware that such engines are or ever have been used for
the purpose of separating the fibres of crude vegetable matter,
2503 as such fibres have always heretofore been disintegrated by
boiling and chemical action, so as to have entirely lost their conformation and characteristics before being placed into the beating engine. I am also aware that caustic alkaline solutions have been used for disintegrating and reducing crude vegetable fibrous productions to pulp or to a pulpy mass, in conjunction with heat. I do not claim the use of caustic alkalines for this purpose. But I am not aware that such solutions have ever been used for softening but not disintegrating crude material as a preparatory treatment to its mechanical disintegration. Nor am I aware that any chemical treatment has ever been applied to crude vegetable fibrous matter for the purpose of desicating, condensing, or curing such material, or for the purpose of reducing the cost of transportation of the same as a fibrous material, as I have described, prepared for shipment, storage, and future disintegration.

I do not limit myself to any particular vegetable fibrous production, as all crude fibrous matter may be advantageously treated as I have described. Nor do I limit myself to any particular means for mechanically disintegrating bamboo or other fibrous material which has been prepared for such integration by being softened as I describe. Nor do I limit myself to any particular time for such disintegration, whether before or after washing the softened matter, although I prefer to first wash it for the reasons set forth. Nor do I limit myself to any kind of chemical treatment for the purpose of preparing crude vegetable fibrous material to be baled compactly, when such treatment is for the purpose of destroying insect life or economizing bulk and lowering the cost of transportation, as it would be worth while, for this purpose, to use other chemical agents than alkalies, even though the cost of such chemical teatment was an additional cost to the ultimate product, but I prefer to use alkalies for the reason set forth.

I do not claim broadly the preparation of pulp or disinte-
2504 grated fibre from bamboo or other fibrous production; nor
do I claim the production of balls or bales of cane or bamboo fibre as an article of commerce, except when the same have

been disintegrated mechanically after softening the crude material, as I have described in this and my previous specifications.

I do not limit myself to any particular use for the fibre extracted by my process, as it is equally superior to fibre extracted by other processes for any purpose where fibre is or may be used, whether for paper-making or for the purpose of making soft-felted fabrics, either alone or mixed with other material, or for the purpose of string or rope making, or for textile fabrics. By my process fibres can be extracted from bamboo which can be mixed with linen or silk, or it can be spun and woven alone without admixture with other material.

What I claim as my invention and as new, and desire to secure by letters patent of the United States, is—

1. Subjecting crude vegetable fibrous material to any chemical treatment which softens and shrinks its bulk without disintegrating the same, for the purpose set forth and described, as a new article of commerce.

2. Preparing bamboo or other crude vegetable fibrous matter for transportation and for subsequent disintegration as a fibre-producing material, by means of an alkaline or caustic alkaline solution.

3. Softening and preparing bamboo or other crude vegetable fibrous matter by means of an alkaline solution, when so applied as not to disintegrate the material, but simply to prepare it for mechanical reduction, as fully set forth.

4. The process of disintegrating bamboo or other like crude vegetable fibrous matter, by means of the beating or rag engine or its mechanical equivalent, when such bamboo or other fibrous matter has not been reduced to a pulpy mass by chemical action, or when the material has not been previously subjected to a
2505 treatment which destroys its woody conformation, but has been prepared for mechanical disintegration by being softened in an alkaline solution.

COMPLAINANT'S EXHIBIT RUSSELL AND HOWLAND UNITED STATES PATENT. April 22, 1889. W. T. F., S. E.

UNITED STATES PATENT OFFICE.

ROBERT W. RUSSELL, of Brooklyn, and THOMAS HOWLAND, of Stockport, New York.

Letters Patent No. 70474, dated November 5, 1867.

Preparation of Paper Pulp from Reeds, etc.

The schedule referred to in these letters patent and making part of the same.

To all whom it may concern:

Be it known that we, Robert W. Russell, of the city of Brooklyn, in the State of New York, and Thomas Howland, of Stockport, in Columbia county, in the State of New York, have discovered and invented a new and useful method and process for making paper pulp, papier-maché, and other materials from reeds, cane, bamboo, or hemp stalks, or other vegetable fibrous substances, and a new article of manufacture, that is to say, pulp suitable for the manufacture of paper, papier-maché, box-board, pasteboard, paper 2506 board, felted pulp, and other articles, made from reeds, cane, bamboo, or hemp stalks, or other fibrous vegetable substance, which has been subjected to Lyman's steam-blowing process, and then beaten into pulp, either with or without any treatment with chemicals; and we do hereby declare that the following is a full, clear and exact description thereof:

The cane, reeds, bamboo, or other vegetable fibrous substances, we cause to be first subjected to the steam-blowing process for which a patent was granted by the United States to Azel S. Lyman, on the 3d August, 1858.

We have discovered that the steam-blown material, after being beaten up in a rag engine, without any chemical or other preliminary treatment, will felt, and can be run off into paper, in the same way as paper is manufactured from pulp made from straw, wood, and other fibrous substances which have been boiled in alkaline solutions. This result is due to the fact that the steam-blowing process produces an effect similar to that of the rotting process upon flax straw, and similar to the process of maceration applied to manilla and various other vegetable fibrous substances.

By the steam-blowing process the fibrous substances are partially distintegrated. The heat of the steam changes the nature or condition of the gums or cementing matter holding the fibres together, so that such gums or cementing matter can be easily washed out or otherwise got rid of. The silex is dissolved or softened, and shattered and blown from the fibres, and the pith and other worthless matter is converted into dust, and the intercellular tissue of the vegetable fibrous substances which have been subjected to the steam-blowing process is, by the action of the rag engine, eliminated from the cellulose sufficiently to insure the felting of the fibres, from which the gums and other cementing matter have been washed out. By this simple process a material can be obtained which, on account of its cheapness, will be available for many new manufactures.

We have also discovered that when vegetable substances
2507 which have been subjected to the said steam-blowing process
are to be treated with caustic alkali or other chemicals, for the manufacture of a fine quality of paper or felt, such steam-blown material should be beaten, ground, crushed, or bruised, and washed, before the application of the chemicals.

The beating, grinding, crushing, or bruising, and washing of the steam-blown material may be done in a paper-maker's beating or rag engine, or by any other or well-known and suitable mode of beating, grinding, crushing, or bruising, and washing similar substances. It is convenient to beat, grind, crush, or bruise, and wash the said steam-blown material at one and the same time, but the washing may be done, wholly or partly, after the beating, grinding, crushing, or bruising as aforesaid.

The vegetable fibrous substances having been thus disintegrated and prepared for washing, and having been washed as aforesaid, and thereby deprived of a large part of the acid, gum, gluten, resinous, cementing, coloring, and other worthless and obnoxious matter, can be reduced to superior paper pulp, papier-maché, and other valuable materials, much quicker and more economically, and with the use of a smaller quantity of chemicals, and with a less degree of heat, than would be required if the steam-blown material had not been so prepared and cleansed as aforesaid. The quality of the product is also much better than it would be if the said fibrous substances after being steam-blown as aforesaid, were without such cleansing preparation subjected to a boiling in chemical solutions with such worthless and obnoxious matters, which neutralize a large portion of the chemicals used.

The material thus prepared may be boiled in any of the ordinary chemical solutions used in the boiling of straw, wood, and other vegetable fibrous substances, to convert the same into paper pulp and papier-maché, such as soda-ash made caustic with lime, or the caustic soda of commerce, or soda-ash, or sal-soda, or potash, or caus-
tic potash, or lime, lime water, or milk of lime, according to
2508 the quality of the material to be manufactured. After the
boiling in a chemical solution has been completed, the material is to be treated in the usual way, to be made into paper, papier-maché, and other products.

Prior to our said discovery and invention it was not known that the said steam-blown material could be made into paper without the use of chemicals, and the advantage of the said cleansing process, as a preliminary to the application of chemicals to the said steam-blown material, was not known. But the steam-blown material not having been subjected to the said cleansing process before the boiling in chemical solutions as aforesaid, a small portion only of the acid, gummy, resinous, and cementing matter has been got rid of before such boiling, and the greater part of such matter went into the tank or boiler on such boiling, and absorbed much of the chemicals used therein, besides causing the product to be inferior.

What we claim as our discovery and invention, and desire to secure by letters patent, is—

1. The above-mentioned process of making paper pulp, papier-maché, and other articles from vegetable fibrous substances, disintegrated as aforesaid by the said steam-blowing process, without maceration, boiling or chemicals.

2. The method of treating vegetable fibrous substances which have been subjected to the said steam-blowing process for the purposes aforesaid, by beating, grinding, crushing, or bruising, and washing the same, before the boiling of the same in any chemical solution, substantially as described.

3. The new articles of manufacture above described, that is to say, pulp of different kinds, suitable for the manufacture of paper and papier-maché, box-board, pasteboard, paper board, felted pulp, and other articles made either with or without the use of chemicals, substantially as above described.

Dated 13th August, 1867.

2509 COMPLAINANT'S EXHIBIT ROBBINS & SOUTHMAYD UNITED STATES PATENT. April 22d, 1889. W. T. F., S. E.

UNITED STATES PATENT OFFICE.

LOUIS S. ROBBINS, of New York, N. Y., and JOHN A. SOUTHMAYD, of Elizabeth, New Jersey.

Letters Patent No. 87295, dated February 23, 1869.

Improvement in Preparing Fibre from Bamboo, &c.

The schedule referred to in these letters patent and making part of the same.

To all whom it may concern:

Be it known that we, Louis S. Robbins, of the city, county, and State of New York, and John A. Southmayd, of Elizabeth, in the county of Union, and State of New Jersey, have invented a new and useful improvement in preparing fibre from lignin of bamboo or cane, for the manufacture of textile fabrics; and we do hereby declare that the following is a full, clear, and exact description thereof, which will enable those skilled in the art to make and use the same.

Our invention relates to the development, disintegration, and preparation of the fibre of the bamboo for textile uses and purposes. We prefer the bamboo of the East and West Indies, and similar climates, having ascertained, by actual experiment, that the fibre thereof is stronger, and better adapted for said uses and purposes.

It is already understood that ligneous substances may be reduced to a fibrous pulp by a proper treatment with chemicals, as alkalies and acids, but no process has hitherto been discovered whereby the fibre of cane can be successfully applied to the manufacture of tex-
tile fabrics, as the treatment has not been so conducted as to
2510 obtain a fibre of sufficient length and strength, and otherwise
suitable for such a purpose.

In treating cane heretofore for the purpose of obtaining a pulp, or fibrous material, it has been subjected to the action of steam under pressure, or acids, and for such length of time as it required to soften the knotty joints and tougher portions that grow near the ground; besides no ad*a*quate mechanical means has been employed in connection with the treatment. The consequence has been that in subduing or softening the joints and harder portions of the cane by steam under pressure, or acids, the fibre of the lignin between the joints, which is the only portion that can be used for textile fabrics, has been destroyed for such purpose.

It is absolutely necessary to so commence and pursue the process that all the contained silicious and resenous matter shall be expelled, and that only such portion of the lignin shall be subjected to the process as shall afford the proper and desired fibre. Not only that, but the lignin, either before or after the disintegration of the fibre, should be saturated with oleaginous vapors.

In operating our present invention, we, in the first place removed the knots or joints, and then split the bamboo longitudinally in strips by means of sharp-edged instruments, arranged for the purpose.

After removing the knots or joints, and splitting the bamboo as aforesaid, the lower and tougher portions of the bamboo are separated from the remainder, since the hard and tenacious fibre that grows near the ground requires a treatment which for our present purpose, would be injurious to the upper and more tender parts.

The bamboo is then boiled in caustic alkali of about six degrees (6°) Baumé in an open kettle, until the silicious and gummy matter is softened. This operation requires from six to ten hours, according to the age and quality of the bamboo.

In this part of the process, the time occupied will de-
2511 pend upon the character of the lignin, the tougher and more
tenacious portions requiring the more vigorous treatment.

The next stage in the process is to press the bamboo, while hot, for the purpose of expelling the water, and so much of the silicious and resinous matter as may be held in solution, or combined with the bamboo; also, to prepare it for the subsequent boiling and cleansing processes.

We then again boil the bamboo in a weak solution of caustic soda for about three hours and afterwards for about two hours in soap and water, prepared for the purpose, which cleanses and softens the fibres without reducing it to a pulpy condition, or imparing its strength, which would be the result if longer boiled in caustic alkali.

The bamboo is then washed in hot water, until all the foreign substances are removed from the fibre, when it is prepared for carding, by passing it through a machine hackle constructed for the purpose. It is next subjected to strong and peculiarly constructed cards, which reduce the fibre to a proper condition for spinning.

It is necessary that the fibre be in a moist state during the operation of carding; but if water is employed for that purpose the fibre is weakened, and will be destroyed while passing through the cards. We therefore saturate the fibre with oleaginous vapors, which render it pliable, and lubricate it without imparing its strength. It can then be carded with facility, and a length of fibre retained, of sufficient length and strength to be applicable to and valuable for textile manufactures and purposes.

The fibre may be used either separately or in combination with other substances, for the purposes stated.

Having thus described our invention,

What we claim as new, and desire to secure by letters patent, is—

2512 The process herein described of preparing the lignin of bamboo for manufacturing textile fabrics, substantially as herein set forth.

COMPLAINANT'S EXHIBIT SAWYER AND MAN HYDROCARBON TREATMENT PATENT. H. C. M., Special Examiner.

UNITED STATES PATENT OFFICE.

WILLIAM E. SAWYER, of New York, and ALBON MAN, of Brooklyn, N. Y.

Improvement in Carbons for Electric Lights.

Specification forming part of Letters Patent No. 211,262, dated January 7, 1879; application filed October 15, 1878.

To all whom it may concern:

Be it known that we, William Edward Sawyer, of the city, county, and State of New York, and Albon Man, of Brooklyn, county of Kings, and State aforesaid, have jointly invented certain improvements in carbons for electric lights; and we do hereby declare the following to be a description of the same, and of the manner and process of making, constructing, and using them, in such full, clear, concise, and exact terms as will enable any person skilled

in the arts or science to which it appertains, or with which
2513 it is most nearly connected, to make, construct, and use the
same, reference being had to certain letters patent of the United States heretofore granted to us for certain inventions hereunto appertaining, and to which especial reference will hereinafter be made.

Our invention is, first, of a novel process of preparing the illuminating part of an electric lamp, consisting of electrically heating the same while it is surrounded by a carbon liquid; secondly, of a new article of manufacture, consisting of an improved illuminating conductor for electric lamps, composed of consolidated carbon created by electric action; thirdly, of a novel process of preparing the illuminating part of an electric lamp, consisting of first heating the same by means of the electric current while immersed in a carbon liquid, and of subsequently, when the globe containing it is charged with nitrogen gas, and before the flow of such gas through the lamp has ceased, and before the lamp is finally sealed, heating its illuminating part by means of the electric current to drive out impurities or occluded gases.

In letters patent of the United States No. 205,144, granted to us, we have shown and described an electric lamp in which a pencil of carbon is heated to incandescence in a nitrogen or other carbon preservative atmosphere. One of the principal obstacles to successful electric lighting by incandescence is the dissociated character of nearly all obtainable carbon. In most of such carbon there is danger of fracture as well as of the establishment of the voltaic arc; and, furthermore, the carbon, unless specially prepared by our process, naturally occludes sufficient air or oxygen to render its consumption a mere question of time, since, as fully set forth in the letters patent referred to, the least quantity of oxygen in a sealed lamp is sufficient to combust an indefinite quantity of carbon.

As is well known, carbon suitable for electric lighting by the
voltaic arc is naturally produced in gas retorts; but generally
2514 the rods of carbon used in the "regulator-lamps," so called,
are molded from the powdered material. Neither the one nor the other quality of carbon is suitable for electric lighting by incandescence. In both there is a lack of homogeneity. The pencil is not sufficiently hard and dense, because in the first place the heat required to produce the proper character of carbon is as high as 7,000° Fahrenheit, and such a temperature is not obtainable in the retort, and in the second place the mechanical subdivisions of the material and the pressure necessary to produce the perfect article are practically unattainable. Carbons of the ordinary sort, when heated by the electric current, exhibit points and lines of unequal brilliancy. Carbons prepared by our process, when so heated, glow with a uniform brilliancy throughout.

We have found that a pencil of carbon immersed in a hydrocarbon liquid, and heated to an extremely high temperature by the voltaic current, is not itself attacked, but decomposes the surrounding matter, the carbon of which enters and fills up its pores to an extent impossible except with matter in a very attenuated state, and deposits a perfectly homogeneous layer, generally of a bright-gray color, upon the exterior surface. As the carbon increases in size more current is required to maintain its temperature, and if the current is gradually increased, in accordance with the demand for it, there is appearingly no limit to the increase in mass of the homogenous exterior deposit. Carbon pencils may be cut from this deposit, or the original pencil with its coating may be used in the lamps.

In this process it would seem that the carbon is never in contact with the liquid in which it is immersed, but surrounded by a carbonic gas of a very high temperature.

Naphtha, turpentine, beeswax, balsam, and most oils, if pure, operate satisfactorily. Almost any hydrocarbon, in fact, will answer.

We do not confine ourselves to the treatment of carbon
2515 alone, since it is obvious that many infusible substances non-
conductors of electricity may be heated in hydrecarbon liquids so as to render them conductors of electricity—as, for instance, a tube of lime inclosing a pencil of carbon, through which the electric current is caused to circulate.

In the letters patent hereinbefore referred to we have described a method of charging a sealed globe with pure nitrogen gas. We will suppose that the pencil of carbon, held between two carbon pieces of greater mass than that of the pencil, as shown in the said letters patent, is immersed in the hydrocarbon liquid and heated in the manner already described. Being then cleansed in alcohol, the pencil and its holders, without having been disturbed, are placed in the globe, in which they are to be hermetically sealed. The globe is charged with pure nitrogen, and then, while still allowing pure nitrogen to flow into and out of the globe, we heat the carbon to incandescence, thus driving out all impurities and occluded gases, which are carried out of the lamp by the current of nitrogen. With this operation the preparation of the carbon is completed, and the lamp now being hermetically sealed, as described in the letters patent referred to, is ready for use.

In concluding this description we will point out that the preparation and treatment of the carbon must take place in carbon liquid before it is put in the lamp, for if the carbon pencil be put in the globe of the lamp and hydrocarbon gas be present, part of the deposit resulting from its decomposition adheres to the globe of the lamp, making it black, and if the process be long continued the globe becomes so thickly coated as to obstruct the light absolutely; and that part of the carbon deposited upon the pencil-burner, or part of it, at least, instead of uniting with, consolidating, and purifying the pencil, collects in a sooty mass around its upper part, like a "thief" on the wick of a tallow candle, the effect of which is to
greatly impair the light and to practically destroy the lamp.
2516 The lamp becomes inoperative, also, for the additional reason
that the carbon gas being deposited leaves the hydrogen, in which the pencil is soon consumed; but the carbon prepared by our process before it is put in the lamp does not blacken the inner sur-

face of the globe of a lamp charged with nitrogen when heated by the current to drive out occult gases during the ingress and egress of the nitrogen, because in that case there is no carbon gas present, and, of course, no deposit; and we desire, also, to point out the fact that the consolidated homogeneous carbon of our invention may be produced by the electroplating process, as well as by the electrical heating of a conductor in a carbon gas or liquid. The cathode, composed either of solid carbon or of an infusible refactory substance, coated with plumbago or graphite, is immersed in a carbon liquid and connected with one pole of the battery. The other pole of the battery is connected with the anode, composed of solid carbon, also immersed in the liquid. The passage of the current decomposes the liquid, and deposits a homogeneous layer of carbon upon the cathode.

We do not intend to lay any claim to the treatment of a carbon burner after it is made and placed in the globe or illuminating chamber of the lamp, nor as a mere incident of the operation of the lamp as a part of the invention making the subject-matter of this application. We disclaim the treatment of the carbon in that way; but

What we do claim herein as new, and desire to secure by letters patent, is—

1. The method of preparing carbon to be used in the production of electric light, consisting of electrically heating it while surrounded or saturated with or by a carbon liquid.

2. The herein-described method of preparing the illuminating part of an electric lamp, consisting in first obtaining a solid deposit
of carbon by electric action before it is put in the lamp, as
2517 set forth, and subsequently, when the globe containing it is
charged with nitrogen gas, before the flow of the nitrogen through the lamp has ceased, and before the lamp is finally sealed, heating the illuminating part by means of the electric current, in order to expel impurities and occluded gases.

The Sawyer-Man Electric Lamp.

The practical usefulness of the electric light for illuminating open spaces and wide areas has been amply demonstrated by the various devices for using the electric arc already widely employed. Hitherto, however, it has not been found economical, or even possible, as we understand it, to construct a lamp or candle, based on

THE SAWYER-MAN ELECTRIC LIGHT.

the electric arc, that would answer the requirements of ordinary domestic and industrial lighting, where a moderate amount of light, well distributed, easily manageable, and of perfect steadiness and softness, is needed. The electric arc seems, from its very nature, to present insuperable obstacles to the economical production of a large number of small lights in a circuit; in other words, such lights as we require in our dwellings, offices, factories, shops, and the like. And if there were no other means of obtaining light from electricity, the probability of the displacement of gas by it, for the purposes of general illumination, would hardly be worth considering.

(Here follows illustration marked p. 2518.)

2519 The production of light through the incandescence of a pencil of carbon or metal, forming part of an electric circuit and highly heated by its internal resistance to the passage of the electric current, offers an entirely different field for exploration; and though it has long been apparently closed by the failure of early attempts to obtain an electric light by such means, the achieved success of Messrs. Sawyer and Man, not to speak of the reported success of Mr. Edison, clearly indicates that this is the line along which the practical solution of the problem of household illumination by electricity is to come. The lamp, to be described further on, lacks only the practical demonstration of its economy by protracted use on a large scale, to compel acceptance as a successful solution of the problem.

So long ago as 1845, an American inventor, Mr. King, patented here and in England a lamp (said to have been invented by J. W. Starr) involving this principle. His light was produced in a vacuum, to prevent the oxidation of his incandescent carbon or metal, and was extremely promising for its beauty, brilliancy, and steadiness. But it failed to be permanent and economical from various defects and deficiencies, some of which have been removed by the increased power and economy of modern dynamo-electric machines, and by recent advances in the art of subdividing the electric current, but the most of them by the inventions and discoveries covered by Messrs. Sawyer and Man's patents.

The economical division of the current, or more correctly the light produced by a single current—popularly believed to be very difficult if not practically impossible—has been successfully worked out by several American investigators. As long ago as 1875, Mr. Moses G. Farmer, now electrical superintendent of the U. S. Naval torpedo station, at Newport, R. I., subdivided the electric current, produced by a small machine, into forty-two different branches, putting a light to each branch. Mr. Sawyer's system appears to be able to do the same indefinitely through the maintenance of
2520 a uniform resistance throughout the circuit and equal resistances in the several parts of the circuit, as will be shown further on.

The adaptability of this form of electric lighting to the needs of household illumination is indicated in Fig. 1. The light produced is pure, strong, and yet soft, like sunlight. It is, moreover, steady and cool. It is not influenced by air currents; and it does not vitiate the air by poisonous products of combustion, nor by withdrawing the vitalizing oxygen. The lamp takes up less room than the glass shade of a gas jet, and no more than the chimney of an oil lamp. To a limited extent, also, it is portable, and may be used as a drop light. The general appearance of the lamp is shown in Fig. 2 (page 354). The light is produced by the incandescence of the slender pencil of carbon placed as shown in the engraving. The light-giving apparatus is separated from the lower part of the lamp by three diaphragms, to shut off down-ard heat radiation. The copper standards lower down are so shaped as to have great radiating surface, so that the conduction of heat downward to the mechanism of the base is wholly prevented. The structure of the base, full-size, is shown in Fig. 3 (page 355). No detailed description of this portion will be required, further than to say that the electric current enters from below, follows the line of metallic conduction to the "burner," as shown by the arrows, thence downward, on the other side, connecting with the return circuit. The light-producing portion is, of course, completely insulated, and also sealed at the base, gas tight.

(Here follows illustration marked p. 2521.)

A fatal defect in all previous lamps depending on incandescent carbon has arisen from what has been called the "vaporizing" of the carbon. This Mr. Sawyer holds to be an absurdity, since the carbon is not even fused. The wastage of the carbon in mercurial vacuums, and in atmospheres of compound gas, is due, he holds, to chemical decomposition. Many gases, indifferent to carbon at ordinary temperatures, attack it destructively at temperatures obtained in the electric lamp; and the process is continuous, the carbon 2522 taken from the burner being redeposited on the glass case, and the gas left free to continue its depredation. Mr. Sawyer claims to have overcome this difficulty by his method of charging the lamps with pure nitrogen, and by providing for the fixing of any residual oxygen left in the lamp. In this way an unwasting carbon is secured. Another stumbling block on which other workers in this field have come to grief, has been the crumbling or disintegration of the carbon burner, due to sudden heating when the lamp is lighted. This is avoided in the Sawyer-Man lamp by an ingeniously devised switch, shown in Fig. 4. By this means it is impossible to turn the current on or off suddenly, to the disruption of the carbon. This, however, is not the only nor the chief advantage of the switch. It is, indeed, the key to the entire problem, the indispensable condition, Mr. Sawyer holds, of practical electrical distribution.

It is well known that an electric current will exactly and readily divide among circuits of equal resistance. Accordingly, if the resistance of a subcircuit be maintained constant, no matter what may be going on it, whether a lamp is not lighted at all, or

PRINCIPLE OF SWITCH.

lighted to a mere taper, or to any intermediate stage up to full brilliancy, it is obvious that no other lamp or lamps in that circuit will be affected. The operation of the switch, in securing such uniform resistance, is shown in the accompanying diagram, Fig. 5 (page 355).

(Here follows illustration marked p. 2523.)

The lamp has, let us say, a resistance of 0·95 of an ohm. Therefore if one lamp is out there should be a resistance of 0·95 of an ohm in its stead. This is the shunt resistance, B. The current enters at the "+" point, and leaves at the "—" point. The contact piece, A, bearing upon the two studs, 1, 1, all the current passes out by way of B. When A is moved to the studs, 2, 2, the current divides, ¼ going through the lamp, the other ¾ by way of B, and the resistance of the combined circuit is $0{\cdot}31\frac{2}{3} + 0{\cdot}95 = 1{\cdot}26\frac{2}{3}$ in the shunt; and $1{\cdot}9 + 0{\cdot}38 + 25\frac{1}{3} + 18\frac{2}{21} + 0{\cdot}07\frac{5}{12} + 0{\cdot}06\frac{1}{3}$ + (the lamp) $0{\cdot}95 = 3{\cdot}8$. The resistance of the circuit is, therefore, $\frac{1{\cdot}26\,2\text{-}3 \times 3{\cdot}8}{1{\cdot}26\,2\text{-}3 + 3{\cdot}8} = 0{\cdot}95$ of an ohm, and so on. In short, the resistance of the circuit is con-
2524 stant at 0·95, no matter what may be the change in the
proportion of the current given the lamp, as may be seen by making the required calculation for each pair of studs. The varying resistances required to give the best effect have been worked out by practical trial. The effect of ¼ the current through the lamp is to make the carbon a dull red. On studs 3, 3, one-half the current passes through, and the carbon become a bright red. On studs 4, 4, the lamp gets ⅝ of the current and becomes white hot. On 5, 5, the lamp gets ¾ of the current, and begins to assume the intense limpid incandescence of the sun; and the light increases rapidly with subsequent changes until the whole current goes through the lamp.

Thus it is seen that the greater part of the illumination is the product of a small part of the current. When the light is well on, a very slight increase in the current increases the light enormously. It is here that the great loss occasioned by dividing a fixed current among several lamps finds its explanation. A current that suffices in one lamp to produce a light, say of 100 candles, will, if divided between two lamps, give in each perhaps no more than 10 candles, or even 5, making a loss of 90 candles in the sum total. But if the current be doubled, each lamp will give a light of 100 candles, and the sum total will be 200 candles instead of 10. Having brought a candle or a system of candles up to the point of feeble incandescence, a (proportionally) small addition to the current will make them all brilliant. If at 6,000° Fah., a given carbon will produce a light of 3 candles, at 12,000° it will give 9 candles, and at 24,000° it will give 81 candles; the illuminating power increasing with vastly greater rapidity than the temperature.

The wires supplying the current may be run through existing gas pipes, each lamp being provided with a switch placed conveniently in the wall; and by simply turning a key the light is turned up or down, off or on. So long as the house is connected with the main it makes no difference to the producer whether all the lights are on or off, since the resistance of the entire 2525 (house) circuit must be overcome; though it will to the consumer, since a meter records the time that each lamp is on, and the charge is rated accordingly. If the Dynamo-Electric Light Company can supply the illuminating force so cheaply that the constant and brilliant illumination of all the rooms of a house can be secured at no greater cost than the partial and intermittent illumination now had from gas, it is obvious that the electric light will score an important point. The cost of lamps and switches, it is claimed, will not exceed that of gas fixtures.

The meter above referred to as shown in Fig. 6. It is a simple clock arrangement, with an attachment designed to throw the dial hands into connection when a light is on. From each switch a pair of conducting wires are run to opposite studs on the wooden disk shown at the top of the figure. When no current passes through the lamp the revolving spring shown in front of the stud-ed disk turns without making any record. When the current is on, one electric connection at each revolution is made through the pins assigned to the particular lamp, the armature of the magnet is moved, and the recording wheel is advanced one notch. This meter does not measure the quantity of electricity passing, but only the time a lamp is on. If two or any larger number of lamps are on, an equal number of connections are made at each revolution of the wheel, and the record wheel is advanced to correspond. This registration is, of course, a mere matter of business detail. In view of the well-founded popular dislike to gas meters, however, it would seem to be desirable to dispense with such devices entirely; and the nature of electric distribution appears to favor other and less objectionable modes and means of determining the financial relations of producers and consumers.

(Here follows illustration marked p. 2526.)

Figs. 7 and 8 indicate the method proposed for general distribution. Where the main is tapped for a subcircuit, a shunt is introduced so as to throw so much of the current as may be needed into the derived circuit. The resistance of say 100 added lamps 2527 will be about 100 ohms. By giving to the shunt a resistance of one ohm, $\frac{1}{100}$ of the current will be diverted, and the lamps supplied. When a large number of lamps are required in a circuit, a combination of the two plans indicated is employed.

The diversion of any portion of the electric supply into an added circuit, whether one house or a group of houses, necessarily increases the aggregate resistance of the electric district, and calls for more work from the generator. To meet such contingencies automatically, Messrs. Sawyer and Man have invented and patented a regulator, which responds instantly to any increase or diminution in the demand, thereby securing an absolutely uniform volume of current.

This regulator so controls the steam or other power actuating the generator of electricity, that the amount of power supplied is in-

creased or diminished in exact proportion to the demand, either by changing the volume of steam produced, or by coupling on or detaching different generators or parts of a single generator in circuit.

With regard to the cost of this mode of electric lighting no positive figures can be given. It is claimed to be entirely demonstrated that one horse power will give by the Sawyer-Man system of incandescence a light of 30 five-foot gas burners an hour. Where large powers are employed the cost of steam power, every item included, is commonly rated at one cent per horse power per hour. The cost of 150 feet of gas at New York rates is 41 cents, which would make the gas over forty-fold dearer than the Sawyer-Man light. Mr. Sawyer does not stand on this estimate, however, holding that even if the electric light should prove in practice on a large scale to be ten times as costly as calculation indicates, it will yet easily compete with gas, the light furnished being so much better and purer.

It is promised that facilities will soon be offered for the photometric test of a large number of lights, in a circuit, with dynamometric tests of the power employed in generating the electric
2528 supply. This, as already noted, is all that the system lacks to prove itself an accomplished economical fact.

Complainaint's Exhibit, Extract from Philosophical Magazine. C. E. D., Notary Public, May 6, 1889.

I have already shown elsewhere that the current from a small magneto-electric or electro-magnetic machine is sufficient to excite the great electro-magnet of the 10-inch machine; and it has been further found, by my friend Mr. G. C. Lowe, that the current from one small machine is sufficient to excite simultaneously the electro-magnets of several small machines. In a number of 3½-inch machines which have been constructed under my direction for Messrs. Elkington and Co., for the electro-deposition of copper on a large scale, the currents from two 3½-inch electro-magnetic machines are made to excite the electro-magnets of twenty similar-sized machines to a degree sufficient to bring out the maximum dynamic effect of each machine. The electro-magnets of the two 3½-inch exciting machines are charged by the current from a small 2½-inch magneto-electric machine; but I have found that nearly as good a result may be obtained from the twenty machines by dispensing with the small magneto-electric machine, and employing the residual magnetism of the two 3½-inch exciting machines in a manner similar to that described, almost simultaneously, by Mr. Farmer, Messrs. Varley, Mr. Siemens and Sir Charles Wheatstone.

So far I have adverted principally to the means by which a very serious defect in the practical working of the new induction machine was remedied, a defect which many of my friends, who were unacquainted with the efforts which have been made to overcome it, have considered to be fatal to the success of what seemed likely to be a useful invention. But while the
2529 difficulty arising from the heating was now obviated,

the subdivision of the materials of one large machine into a number of small ones gave rise to another defect which it was also found necessary to overcome; for although the armatures of several machines might be driven nominally at the same speed from the said driving shaft, by means of straps, yet when the combined direct current from several commutators was required, the want of perfect synchronism in the revolution of the a-matures operated to produce a diversion of the currents of some of them through the coils of others, which were at the neutral point of their revolution; and consequently the maximum useful effect of the combined currents could not be obtained.

As the high speed at which the machines were driven precluded the employment of toothed gearing, the only method which seemed at all feasible for producing the requisite synchronism of the armatures was to place a number of the machines in a straight line, and connect them together by means of a clutch fixed on the end of each armature spindle. The chief objection to the carrying out of this arrangement was the difficulty of providing the requisite means for preserving the synchronism of the system, when any of the intermediate machines were disabled by accident, or stopped for repairs; so that, practically, it would not have been found convenient to work more than two machines geared together in the manner described.

It was while experimenting with a pair of machines so geared together, that I first observed the phenomenon which forms the subject of this communication. These machines were arranged for producing the electric light, with a view to their application to light-house illumination. The armatures were 4 inches in diameter, and each of them was coiled with a copper-wire conductor, 280 feet long and $\frac{1}{8}$ of an inch in diameter. The currents were taken from the armatures by means of copper brushes rubbing against metal rings connected respectively with the ends of the armature coils, and were therefore in alternate directions. It has
2530 been found that alternating currents are much better
adapted for the production of a constant electric light at a fixed point in space than the current which has been rectified by means of a commutator.

The clutch, by which the armatures were connected, consisted of two iron discs about 4 inches in diameter, having, in the face of one, two iron pins which could be guided into two corresponding holes in the face of the other. These discs could be engaged or disengaged either when the machines were at rest or in motion. The relative positions of the pins and holes in the discs were such that the armatures might be engaged in reversed positions of half a revolution when required.

Each of these 4-inch machines, when making about 2,000 revolutions per minute, was of itself capable of producing a very efficient electric light; and when the two armatures were clutched together in such a position that the united positive currents from both machines proceeded from one polar terminal simultaneously with the united negative currents from the other polar terminal, the sum of the currents of the two machines was obtained. On the other hand, when the armatures were clutched together in the reverse position without any change being made in the armature connections, no current was produced outside the two machines.

These experiments, besides exhibiting the necessity of synchronous rotation, further showed that the armatures must also occupy the same relative position in the magnet cylinders in order that the combined current from the two machines might be obtained. It now occurred to me to see to what extent the want of synchronism in the armatures would affect the magnitude of the current. The armatures were therefore unclutched and allowed to revolve independently of each other, in the same manner as when the attempt was made to take the combined direct current from the commutators. After the alternating current had been transmitted
2531 through the electric lamp for some time, I was surprised to
find that there was no perceptible diminution in the amount of light produced from the carbon points, and that the current would melt very nearly the same quantity of iron wire as when the armatures were clutched together. On examining into the circumstances attending this unexpected phenomenon, I first observed that whenever the machines were stopped, the pins and holes in the respective discs were exactly opposite each other, and that, while the armatures were revolving, the two discs could at all times be engaged and disengaged with the greatest facility. Moreover, even when, before starting the machine, the discs were set a quarter or half a revolution out of the position in which the maximum amount of current was obtained, it was found that after the armatures had been revolving for a few moments, the discs resumed their normal position with respect to each other (as indicated by the action of the clutch), thereby exhibiting not only the synchronous rotation of the armatures, but also that the machines contained a principle of self-adjustment to the position in which the maximum effect of the combined current was obtained. It will, therefore, be evident that this property of the current, to maintain the synchronism of the armatures, renders it unnecessary to employ mechanical gearing of any kind for that purpose.

Proceeding further in this investigation, I found that, in order to produce a synchronous rotation, it was not at all essential that the circuit which conveyed the combined currents for producing the light should be completed, provided that the ends of the coils of each armature were connected respectively with the same metal plates which formed the polar terminals of the machines. In this case the armatures adjusted themselves to their normal positions even more readily than when the current was producing light.

Sections 677–679, on pages 630–635.

677. Luminous effects.—In closing a voltaic battery a spark is obtained at the point of contact, which is frequently of great brilliance. A similar spark is also perceived on breaking contact. These luminous effects are obtained when the battery is sufficiently powerful, by bringing the two electrodes very nearly in contact; a succession of bright sparks springs sometimes across the interval, which follow each other with such rapidity as to produce a con-

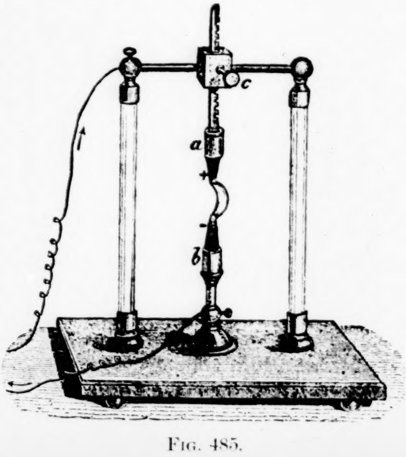

FIG. 485.

tinuous light. With eight or ten of Grove's elements brilliant luminous sparks are obtained by connecting one terminal of the battery with a file, and moving its point along the teeth of another file connected with the other terminal.

2533 The most beautiful effect of the electric light is obtained when with the terminals of the battery two pencils of charcoal are connected in the manner represented in Fig. 485. The charcoal *b* is fixed while the charcoal *a*, can be raised or lowered by means of a rack and pinion motion *c*. The two charcoals being placed in contact the current passes, and their ends soon become incandescent. If they are then removed to a distance of about the tenth of an inch, according to the intensity of the current, a luminous arc extends between the two points which has an exceeding brilliant lustre, and is called the voltaic arc.

The length of this arc varies with the force of the current. In air it may exceed 2 inches with a battery of 600 elements, arranged in six series of 100 each, provided the positive pole is uppermost, as represented in the figure, if it is undermost the arc is about one-third shorter. *In vacuo* the distance of the charcoal may be greater than in air; in fact, as the electricity meets with no resistance, it springs between the two charcoals, even before they are in contact. The voltaic arc can also be produced in liquids, but it is then much shorter and its brilliancy is greatly diminished.

2534 The voltaic arc has the property that it is attracted when a magnet is presented to it; a consequence of the action of magnets on currents.

Some physicists have considered the voltaic arc as formed of a very rapid succession of bright sparks. Its color and shape depend on the nature of the conductors between which it is formed, and hence it is probable that it is due to the incandescent particles of the conductor, which are volatilised and transported in the direction of the current, that is, from the positive to the negative pole. The more easily the electrodes are disintegrated by the current, the greater is the distance at which the electrodes can be placed. Charcoal, which is a very friable substance, is one of the bodies which gives the largest luminous arc.

Davy first made the experiment of the electric light, in 1801, by means of a battery of 2,000 plates, each 4 inches square. He used charcoal points made of light-wood charcoal which had been heated to redness, and immersed in a mercury bath; the mercury penetrating into the pores of the charcoal, increased its conductibility. When any substance was introduced into the voltaic arc produced by this battery, it became incandescent; platinum melted like wax in the flame of a candle, sapphire, magnesia, lime and most refractory substances were fused. Fragments of diamond, of charcoal and of graphite, rapidly disappeared without undergoing any previous fusion.

As charcoal rapidly burns in air, it was necessary to operate *in vacuo*, and hence, the experiment was for a long time made by fitting the two points in an electric egg, like that represented in Fig. 455. At present the electrodes are made of gas graphite, a modifi-

cation of charcoal deposited in gas retorts; this is hard and compact, and only burns slowly in air; hence it is unnecessary to operate *in vacuo.* When the experiment is made *in vacuo*, there is no combustion, but the charcoal wears away at the positive pole, while it is somewhat increased on the negative pole, indicating
2535 that there is a transport of solid matter from the positive to the negative pole.

678. Foucault's experiment.—This consists in projecting on a screen the image of the charcoal points produced in the camera obscura at the moment at which the electric light is formed (Fig. 486). By means of this experiment, which is made with the photo-electric microscope, already described (Fig. 344, page 442), the two charcoals can be readily distinguished, and the positive charcoal is seen to become somewhat hollow and diminish, while the other increases. The globules represented on the two charcoals arise from the fusion of a small quantity of silica contained in the charcoal. When the current begins to pass, the negative charcoal first becomes luminous, but the light of the positive charcoal is the brightest; as it also wears away the most rapidly, it ought to be rather the larger.

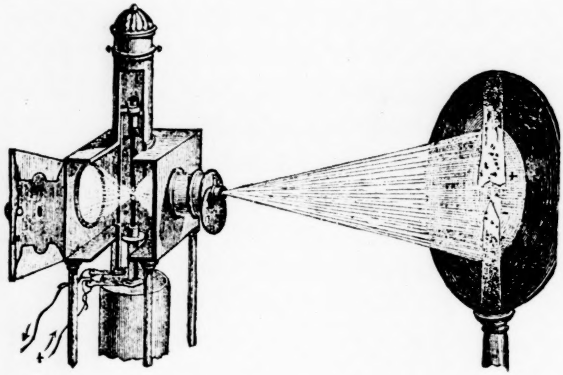

Fig. 486.

679. Regulator of the electric light.—When the electric light is to be used for illumination, it must be as continuous as other modes of lighting. For this purpose, not only must the current be constant, but the distance of the charcoals must not alter, which
2536 necessitates the use of some arrangement for bringing them nearer together in proportion as they wear away. One of the best modes of effecting this is by an apparatus invented by M. Duboscq.

In this regulator the two charcoals are movable, but with unequal velocities, which are virtually proportioned to their waste. The motion is transmitted by a drum placed on the axis, x y (Fig. 487). This turns in the direction of the arrows two wheels, a and b, the

diameters of which are as 1 : 2, and which transmit their
2537 motion to two rack-works, C and C′. The first lowers the
positive charcoal, *p*, by means of a rod sliding in the tube,

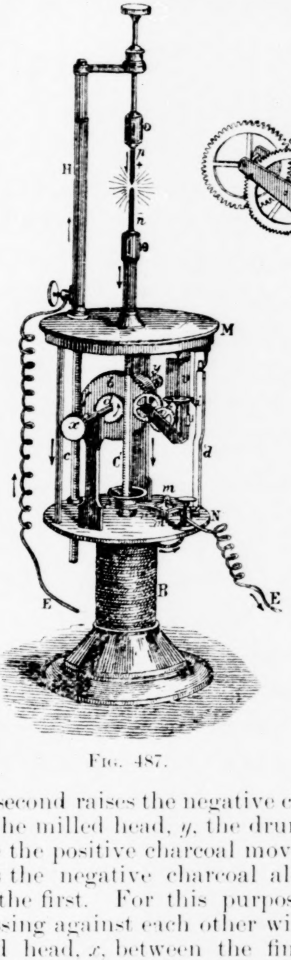

FIG. 487.

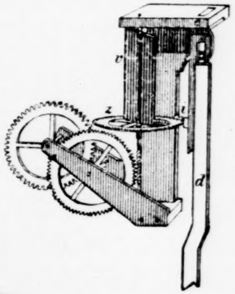

FIG. 488.

H, while the second raises the negative charcoal, *n*, twice as rapidly. By means of the milled head, *y*, the drum can be wound up, and at the same time the positive charcoal moved by the hand; the milled head *x*, moves the negative charcoal also by the hand, and independently of the first. For this purpose the axis, *x y*, consists of two parts pressing against each other with some force, so that holding the milled head, *x*, between the fingers, the other, *y*, may be moved, and by holding the latter the former can be moved. But the friction is sufficient when the drum works to move the two wheels *a* and *b* and the two rack-works.

The two charcoals being placed in contact, the current of a powerful battery of 40 to 50 elements reaches the apparatus by means of the wires E and E′. The current rising in H, descends by the positive charcoal, then by the negative charcoal, and reaches the apparatus, but without passing into the rack-work, C, or into the part on the right of the plate, N; these pieces being insulated by ivory discs placed at their lower part. The current ultimately reaches the bobbin B, which forms the foot of the regulator, and passes into the wire E′. Inside the bobbin is a bar of soft iron, which is magnetized as long as the current passes in the bobbin, and demagnetized when it does not pass, and this temporary magnet is the regulator. For this purpose it acts attractively on an armature of soft iron, A, open in the centre so as to allow the rack-work C′ to pass, and fixed at the end of a lever, which works on two points, *m m*, and transmits a slight oscillation to a rod, *d*, which, by means of a catch, *i*, siezes the wheel, *z*, as is seen on a larger scale in the figure 488. By an endless screw, and a series of toothed wheels, the stop is transmitted to the drum, and the rack-work being fixed, the same is the case with the rack-work. This is what takes place so long as the magnetisation in the bobbin is strong enough to keep down the armature, A; but in proportion as the car- 2538 bons wear away, the current becomes feebler, though the voltaic arc continues, so that ultimately the attraction of the magnet is no longer equivalent to a spring, *r*, which continually tends to raise the armature. It then ascends, the piece *d* disingages the stop *i*, the drum works, and the charcoals come nearer; they do not, however, touch, because the intensity of the current gains the upper hand, the armature A is attracted, and the charcoals remain fixed. As their distance only varies within very narrow limits, a regular and continuous light is obtained with this apparatus until the charcoals are quite used.

By means of this regulator, M. Duboscq illuminates the photogenic apparatus represented — Fig. 344, by which all the optical experiments may be performed for which solar light was formerly necessary.

Complainant's Exhibit Muspratt's Chemistry Extract. April 22, 1889 W. T. F., S. E.

Chemistry, Theoretical, Practical, &c., by Dr. Sheridan Muspratt, published at London, Glasgow, and New York, vol. 2, page 642.

Very little information can now be obtained of the invention and early progress of the art of paper-making. The earliest accounts do not agree, either in regard to date or place; but all point to the East as the seat of the discovery, leaving almost no doubt that the principle of the modern art of reducing vegetable fibre to a liquid state is a Chinese invention. * * *

The paper produced resembles what is commonly termed flimsey, but takes a finer and more delicate impression from copper plates, and is known by the name of India proofs. A small quantity of it is used in this country for the finest engravings. It is generally made of the inner bark of the bamboo and cotton tree.

2539 In the United States Patent Office.

Edison vs. Maxim vs. Swan. } Interference. Electric Lamps.

In pursuance of the annexed notices the parties to the above interference attended before me on the day herein named by attorney as follows: Joseph Wilson Swan by H. A. Seymour, L. L. Leggett, L. W. Serrell, and W. M. C. Witter, counsel. Thomas A. Edison by Richard N. Dyer, counsel.

WM. H. MEADOWCROFT,
Notary Public, N. Y. Co.

Thomas A. Edison, a witness produced in his own behalf, being duly sworn testifies as follows, in answer to questions proposed to him by Richard N. Dyer, counsel for Edison:

1 Q. What are your name, age, residence and occupation?
A. Thomas A. Edison, residence New York, occupation inventor, age thirty-six.
2 Q. The first issue in this interference is "A carbon formed from a straight strip of card-board, paper, or parchment paper, bent to the form of an arch, hoop or loop and carbonized by heat while in a bent condition substantially as set forth." When did you conceive the invention set forth in this issue?
A. About August, 1877.
2540 3 Q. What did you then do? What trial, if any, did you then make of this invention?

Objected to as leading.

A. I made a lamp in August, 1877, containing a strip of carbon in the form of a horseshoe which had been previously cut straight from card-board paper bent in the form of a horseshoe or arch and carbonized while in that condition. This arch of carbon was placed in clamps and put under the bell-receiver of an air pump and the air exhausted therefrom and the carbon brought up to incandescence by the passage of the electric current through the same.
4 Q. Are you sure this was in 1877?
A. Yes.
5 Q. When next did you use this invention?

Objected to as leading.

A. About November, 1878.
6 Q. Please state what you did then.
A. We tried experiments over again with various materials.
7 Q. State the next definite use of this invention.

Objected to as leading.

A. We continued these experiments at different times up to

October, 1879, when they were successful, the conditions being attained necessary to render the incandescent conductor suitable and of commercial value.

8 Q. Please state more fully the nature of the success attained in October, 1879.

A. At that time we had conducted the experiments by means of a Sprengel pump, instead of the old hand air pump, and used a vessel made entirely of glass, through which the wires passed connecting the terminals of the filament of carbon, instead of the ground joints and cemented joints previously used upon the old air pump. Under the new conditions a very high *vacuo* was obtained which was on account of the chamber being entirely of glass, permanent. With the old air pump and ground joint a vacuum could not be made high enough to prevent the destruction of the 2541 carbon, and it could not be maintained after obtaining a partial vacuum.

9 Q. Did the lamps made in October, 1879, answer in all particulars the first issue of this interference?

Objected to as leading, the witness not having as yet stated that he made any lamps in 1879, and further objected to on the ground that the witness will state the facts and the office will determine whether or not those facts embrace the issue.

A. A number of lamps were made in October, 1879, and in November, 1879, which contained a carbon formed from a strip of cardboard, paper, and parchment paper bent to the form of an arch or loop or horseshoe and carbonized by heat while in a bent condition.

10 Q. Have you any records of the manufacture of such lamps embodying the first issue of this interference, and if so, please state what they are.

A. I have here exhibits which have been photographed from my laboratory note book. These exhibits are photographs from pages 131, 133 and 135. No. 32 was a lamp made from a strip of paper $\frac{1}{32}$ of an inch wide and three inches long, bent to the form of a loop and carbonized. No. 33 was made from card-board paper, .043 wide, .010 thick, 3.312 long bent in the form of a loop and carbonized. No. 37 consisted of a strip of card-board paper, three inches long, and one-sixteenth of an inch wide, bent in the form of a loop and carbonized. No. 41, the same. On page 135 there are two dates—one, November 10th at top of the page, and in the middle of the page, November 11th. Under the latter date is shown a piece of paper ready to be carbonized which had been cut out of a piece of card-board and not cut out as a straight piece of paper and bent over to form a loop. The sketches on pages 131 and 133, although not dated, I am sure were made within one or two days of the sketches on page 135 which are dated.

2542 Attorney for Swan objects to the last answer and also objects to the photograph exhibits referred to, on the ground that these exhibits are not the best evidence, and demands that if the witness intends to establish a fact by his original note book, that book must be placed in evidence that the office may be enabled to determine its value and the genuineness of the matter now referred to and claimed to be found on certain pages of this record. It is insisted that it is bad enough to be obliged to run the gauntlet of Mr. Edison's voluminous library but to be concluded by photographs claimed to represent certain pages of some certain book, Swan's attorney enters his earnest protest and will object to any such exhibits or any testimony thereon.

11 Q. What is the number of this note book and of what set of books does it form a part?

Objected to because the note book is not in evidence.

A. The number of the book is 52. It is one of a series of laboratory note books kept by me and my assistants, and this book contains a large number of notes relating to experiments not related to this case.

12 Q. By whom was this particular note book kept, more particularly?

Objected to for reason last stated.

A. Almost entirely by one of my assistants named Charles Batchelor. The exhibits marked 131, 132, 133 and 135 are in his handwriting.

(The photographs referred to are put in evidence and marked "Edison's Exhibit First Issue A," "B," and "C," respectively.)

13 Q. Please look at the paper now handed you and marked "Edison's Exhibit First Issue, A," and state what it is?

2543 A. It is a photograph of page 131 of my note book No. 52.

14 Q. Have you compared this exhibit with the original page of your note book of which you say it is a photograph, and if so, state whether it is a correct copy of the said page and of all of it?

A. I have so compared and it is a correct copy of said page and of all of it.

15 Q. Please look at the paper now handed you and marked "Edison's Exhibit First Issue, B," and state what it is.

A. It is a photograph of page 133 of my note book No. 52, and is a correct copy of that page and all of it.

16 Q. Please look at the paper now handed you and marked "Edison's Exhibit First Issue, C," and state what it is.

A. It is a photograph of page 135 of my note book No. 52 and is a correct copy of such page and all of it.

(It is here stated by counsel for Edison that, since the note book referred to is a book of original notes and contains memoranda of many matters not bearing upon the issues in this interference and of great importance to Mr. Edison, it is not desired to relinquish the custody of the original book itself; but such book is hereby tendered to counsel for Swan, for the purpose of making an examination of the pages referred to, bearing upon the subject-matter of

this interference, and for such other examination as they may desire to make to satisfy themselves of its authenticity. But it is now stipulated by and between the parties in the interference that the photographs referred to and marked "Edison's Exhibits First Issue, A," "B," and "C," respectively be received in evidence in lieu of the pages of the original note book, of which they are photographic
copies, with the understanding that such original note book
2544 be produced at all the hearings in the case, and also be subject to the examination of counsel for Swan for the purpose of cross-examination.)

17 Q. How do these pages of which Exhibits A, B and C are photographs occur in the original note book?

A. They have alternate numbers on them, there being nothing on the back of pages 133 and 135, and only some figuring on the back of page 131. The back of 131 is No. 132, the back of page 133 is 134, and the back of page 135 is 136.

18 Q. What do the numbers 32 to 41 inclusive on these pages indicate?

A. The number of the carbon filament, of proposed lamp, or lamp.

19 Q. Please state what your method of numbering was?

A. Our method was to number the filaments and if they were successfully carbonized and placed in a lamp the number became the number of the lamp.

20 Q. Please state whether or not you recollect if any carbons and clamps corresponding to the sketches in exhibits referred to were embodied in working lamps?

A. We made lamps with all the different kinds of clamps shown in the exhibits.

21 Q. Please explain the construction of carbons shown at the foot of Exhibit C, and in what respect it differs from those shown above in the same exhibit and in the preceding exhibit?

A. This form of filament was cut by means of knives in a steel mould of the shape of the filaments. Previously we had marked straight stripes by means of a pencil and cut them out with scissors and knives and bent them in the form of arches and carbonized the same, but in the filaments shown at the bottom of Exhibit C, the filament was not bent after being cut straight but was cut as shown direct from the paper.

2545 22 Q. About how many working lamps do you think you made in October and November, 1879, as stated by you embodying the first issue of this interference?

A. I think as many as twenty.

(Objected to on the ground that the witness should state the facts and the office will determine whether those facts come within the issue.

Notice is hereby given by counsel for Edison that motion will be made to amend the preliminary statement so far as it relates to the first issue to correspond with evidence already given by Mr. Edison.

placing the date of use of the invention set out in the first issue back to August, 1877.

Counsel for Swan gives notice that he shall object to any testimony tending to antedate the date set up by Mr. Edison in his preliminary statement, and further that he shall object to the amending of such statement on the ground of undue delay in making the application.)

23 Q. The second issue of this interference is "A carbon for an electric lamp made of carbonized parchment paper." When did you conceive this invention?

A. August, 1877. Carbonized parchment paper was used in an incandescent electric lamp under the same conditions as the lamp before testified to in the first count of the interference.

(Objected to as contradicting and tending to antedate the facts set up in the preliminary statement.)

24 Q. What was the nature of this lamp and where is it now?

(Objected to as the witness has not yet testified with reference to any particular lamp as embodying the second issue.)

A. There were two kinds of lamps, one of which consisted of an
air pump, its base and a bell-jar cover; through the base of the air-
pump two wires or connections were passed from the ter-
2546 minals, over which the bell jar was placed and the air ex-
hausted. Between these terminals strips of straight and bent
strips of carbonized card-board paper and parchmentized paper were secured and through which the current passed to bring them to incandescence. One of the apparatus used at that time is, I believe, used as an exhibit in the case of Sawyer and Man *vs.* Edison, and is now in the Patent Office. This exhibit consisted of a spherical chamber of glass with metallic ends which formed a part of the terminals and having a base with a stop-cock so arranged as to be placed over inlet tube of an exhaust pump with the air exhausted from the globe.

25 Q. Have you made further use of carbonized parchment paper for the carbons of electric lamps; if so, please describe such use.

(Objected to as leading and not warranted by the testimony of the witness as thus far given.)

A. In 1878, about November or December, I again used parchmentized paper for forming carbons for electric lights, and in October and November, 1879 made lamps containing flexible filaments of carbon made of parchmentized paper.

(Objected to as not being warranted by the preliminary statement, no statement having been made therein that the witness made any use of this invention prior to the filing of Swan's application, except a single alleged use in August, 1877.)

26 Q. Look at the paper now handed you and marked Edison's Exhibit Second Issue, D, and state what it is.

A. It is a photograph of page 107 of my laboratory note book No. 52.

27 Q. Please compare this exhibit with the original page of your note book which you say it is a photograph of and state whether it is a correct copy of the said page and all of it.

2547 A. I have compared the photograph of page 107 with the original in the book and find it to be the same, and contains all of the original. I will mention that I find the following "D. N. C., M'ch 23, '83," which I suppose is the mark of the photographer, both on the original and photograph.

28 Q. Please look at the paper now handed you and marked "Edison's Exhibit Second Issue, E," and state what it is.

A. It is a photograph of page 117 of my laboratory note book No. 52. I have compared the photograph with the original and find that it is an exact copy and contains all there is in the original and the photographer's mark.

29 Q. Please look at the paper now handed you and marked "Edison's Exhibit Second Issue, F," and make the same statement about it.

A. It is a photograph of page 169 of my laboratory note book No. 52. I have compared the same with the original page and find it is an exact copy of the same, and contains all that is on the original and has the photographer's mark.

These photographs are put in evidence and marked as described, and the same stipulation is entered into with respect to these exhibits as with regard to Exhibits A, B and C.

30 Q. What bearing does Exhibit D have upon the second issue of the interference?

A. I find that in Exhibit D there is mentioned that a lamp was made of vulcanized fibre which is paper parchmentized by means of chloride of zinc; I may mention that while all these exhibits were written by Mr. Batchelor they were done so under my instructions, he merely carrying out my instructions in trying the experiments; I refer to the Exhibits F, second issue, E, second issue, D, second issue, C, first issue, B, first issue, and A, first issue.

Objected to as not warranted by preliminary statement.

2548 31 Q. At what date was this lamp of vulcanized fibre made?

Objected to as not warranted by the preliminary statement.

A. About October 21st, or it might have been the 20th, 1879.

32 Q. I refer to the lamp described in Exhibit D; state why you give a different date for the making of such lamp from the date of the exhibit.

Objected to as Exhibit D does not describe a lamp of any kind.

A. For the reason that we could not have made all of these exhibits in one day, and from a strong impression gained from the exhibit that the lamps were made within one or two days of the date of the exhibit.

33 Q. Please describe the construction of the lamps made from the various materials stated in Exhibit D.

A. The lamps consisted of a globe of glass through which the platinum wires were sealed, upon the ends of which were secured the filaments of carbon, the globe being exhausted by means of a Sprengel pump to high *vacuo*, the carbon being heated to incandescence while being exhausted and afterwards sealed by fusion of the glass practically the same as the present lamp.

34 Q. Please state what bearing Exhibit E has upon the second issue of this interference.

A. This exhibit shows different materials which were carbonized under certain conditions, to investigate the phenomena of carbonization, among which is vulcanized fibre, being paper parchmentized by chloride of zinc. This was an investigation only.

35 Q. On what date about was this investigation made?

A. Either on the same day or the day previous to the date contained in the exhibit, October 27th, 1879. I may mention
2549 that all the experiments recorded in these exhibits were made
always within one or two days of the date contained thereon.

35 Q. Please state what bearing Exhibit F has upon the second issue of the interference?

A. Exhibit F shows the record of lamps made with their various numbers and what the carbons were made from. For instance, lamps Nos. 79 and 80 were made from Crane's parchment paper No. 56, lamps Nos. 81, 82 and 83 were made from Crane's parchment paper No. 44. Sample books of parchmentized paper made by the manufacturer Crane were obtained, and from the different samples in the book filaments were cut and carbonized. These lamps were good and commercial lamps.

(Objected to as embracing matter not warranted by the preliminary statement.)

36 Q. What was the construction of the lamps described in Exhibit F?

A. The construction was substantially the same, in fact was exactly the same, as in my patent No. 223,839 of January 7th, 1880, filed November 4th, 1879, except the filament was in the form of a horseshoe and clamped in platinum clamps.

(A copy of the patent referred to in the answer is put in evidence and marked "Edison Exhibit Second Issue, G." It is now stipulated that copies of patents may be used in evidence by either side the same as regular certified copies.)

37 Q. Have you preserved any of the parchment paper like that used by you in 1879?

A. Yes, sir.

38 Q. I call your attention to a piece of paper marked "Edison's Exhibit Second Issue, H;" please state what this is?

A. It is a piece of parchment paper with the blanks marked
2550 on it which were to be cut out by a knife or scissors, the
blanks being placed between the steel molds the shape of the filaments required, and cut, and then afterwards carbonized and placed in lamps. This mold, I think, was used in December, 1879. Possibly it might have been used in January, 1880. I do not think we used this mold after January, 1880. But my assistants, who will testify in this case, will probably be able to remember better than I. A number of filaments cut from carbonized paper, and from this form, were made and placed in electric lamps and worked; the lamps were good lamps.

39 Q. Where was Exhibit H found?

A. It was found by my assistant, Martin Force, in the case at my laboratory containing old apparatus used in the early stages of electric lighting.

Objected to.

40 Q. Where is Charles Batchelor in whose handwriting Exhibits A to F are written?

A. He has been residing at Paris, France, since July or August, 1881.

A copy of caveat No. 93 of Thomas A. Edison entitled "Improvement in electric lighting," dated December 17th, 1879, filed December 22d, 1879, is put in evidence and marked "Edison's Exhibit Second Issue I," it being stipulated that said copy shall be received in evidence with the understanding that the original or a certified copy thereof be produced at the hearing.

41 Q. I call your attention to your caveat 93 filed December 22d, 1879, a copy of which I hand you. What bearing has this caveat on the second issue of the interference?

A. On page 8 of a copy of this caveat it is stated that vulcanized paper which is paper may be used. Vulcanized fibre is paper parchmentized by means of saturated solution of chloride of zinc
which performs the same operation as sulphuric acid. Lamps
2551 were made in October, November and December of parchment paper parchmentized both by sulphuric acid and chloride of zinc and these lamps worked very perfectly and were good practical lamps and nearly as good as we make them now, the only improvement made since that time being in the refinements of manipulation.

Objection is made to that part of above answer which relates to the manufacturing of lamps as not warranted by the preliminary statement and contradicting it in effect.

By consent the direct examination of the witness is postponed.

Continued on page —.

Pursuant to adjournment, the taking of testimony on behalf of Edison is continued this 24th day of May, 1883, at 10.45 a. m.

Present: W. C. Witter and H. A. Seymour for Swan, and Richard N. Dyer for Edison.

Direct examination of THOMAS A. EDISON resumed:

42 Q. Have you, since 1879, made and used electric lamps provided with carbons formed from straight strips of card-board, paper, or parchment paper, bent to the form of an arch, hoop, or loop, and carbonized by heat while in a bent condition, and, if yea, to what extent has such manufacture and use been continued?

A. I have at various times, since 1879, made lamps of which the filament of carbon was formed of paper, parchment paper, wood, and other materials, cut straight, and bent in the form of a loop, and carbonized while so bent. I think I made, in the latter end of 1880, as many as 300 such filaments of vulcanized fibre or parchment paper (question here repeated) which were cut straight
2552 and bent in the form of a loop and carbonized and these carbons were used in electric lamps. I have, at various times, made a dozen or so lamps containing filaments cut straight, bent in the form of a loop, and carbonized. In fact, all our lamps, that is to say, the principal portion of all our lamps, contain filaments cut straight, bent in the form of a loop and carbonized.

43 Q. Were any carbons made in this way by you between 1879 and the latter end of 1880, that is, by cutting straight strips of card-board, paper, or parchment paper, bending in the form of a loop, and then carbonizing, as stated in my previous question?

A. Yes, sir; my assistants made lamps containing strips cut straight and bent in the form of a loop, and carbonized while so bent, at various time in 1880.

44 Q. To what extent has this practice been continued since 1880?

A. We have made at least 250,000 lamps containing filaments cut straight, bent in the form of a loop, and carbonized while so bent.

45 Q. Have you, since 1879, made and used electric lamps provided with carbons made of carbonized parchment paper, and, if yea, to what extent has such manufacture and use been continued?

A. At various times since 1879 I have made lamps formed of a filament of parchmentized paper. In the latter part of 1880, we started to make a large number of lamps containing a filament of carbon made from parchmentized paper, and obtained specially prepared parchmentized paper from a company called the Vulcanized Fibre Company, which has its works, I believe, at Wilmington, Delaware. Previous to this, at different times, we had used vulcanized fibre, which is parchmentized paper parchmentized by chloride of zinc, but the lamps did not have as long a life as those made from bamboo, on account of the impurities which were in the paper. In the latter end of 1880, we prevailed upon the Vulcanized Fibre Company to make a number of very thin sheets of parch-
2553 mentized paper, with as much of the impurities washed out as was possible by their process. We cut a large number of filaments from this stock, carbonized them, and made lamps, but the life of such lamps was not equal to those of bamboo. In 1882,

about July, I started to produce paper parchmentized by various chemicals, with a view of obtaining a quality superior to that salable in the market, with a view of using the same instead of bamboo, which is variable in its nature and quite costly. I made a great number of samples of such paper, and carbonized the same, but it was not equal to the bamboo. I have been engaged in parchmentizing paper, and other forms of cellulose, for the last six months, with a view of obtaining raw stock from which to cut the filaments of carbon, which would be superior to bamboo, the material we now use.

46 Q. To what extent had you made and used incandescent electric lamps prior to the 20th day of July, 1880?

A. I had made as many as five or six hundred. In January, 1880, I made an exhibition in Menlo Park to the public, wherein I lighted my laboratory, machine shops and two or three houses, one of which was my own house, about one thousand feet from the laboratory, and had ten or fifteen street lights containing incandescent electric lamps containing filaments of carbon. We continued to make them as fast as we had facilities from January, 1880, and before that time and since.

Cross-examination by W. C. Witter, counsel for Swan:

47 X Q. About how many patents on subjects other than the issue of this interference did you take out between October, 1879, and May 27th, 1881, and how many applications for patents did you make between those dates, patents for which were not issued prior to May 27th, 1881, or are still pending. And how many caveats during the same period. In making this answer you are at liberty to refer to any documents which you desire to refer to, and to aid you in the matter, I had you a pamphlet, entitled "Sixth 2554 Bulletin of the Edison Electric Light Company," on the sixth page of which I find the following language: "The following is a list of the first eighty-one patents for electric lighting issued to Mr. Edison in the United States with the number, date and title of each."

Objected to as incompetent, immaterial and irrelevant.

A. Perhaps as many as five or six patents and applications, perhaps two caveats. It would take some time to ascertain the exact number.

48 X Q. I find in the list given on page six of the pamphlet, handed you, twenty-three patents were issued to you between those dates. Will you look at the pamphlet, and see if you are not satisfied that twenty-three patents were issued between those dates?

A. I understand your question to mean the number of patents applied for and obtained between the dates you named If you mean the number of patents issued to me between those dates, I find in the list, which you have handed me, twenty-three patents were issued between the dates named.

49 X Q. You believe that to be a correct statement, do you not?

A. Yes, sir.

50 X Q. Will you now state how many applications for patents you made between those dates exclusive of the applications for patents which are enumerated in the list handed you in the pamphlet.

A. I will look at my books if counsel desires, but will state that there might have been six or there might have been twenty; I cannot say positively without referring to my books.

51 X Q. I should like to have you look at your books and answer the question pretty closely.

A. I find by reference to my list that one hundred and seven patents and applications and ten caveats were made between those dates, but I think some of the applications were allowed and are included in the twenty-three patents which we have just spoken of.

2555 52 X Q. Does the number which you have now given, include your foreign applications?

A. No, sir; American applications.

53 X Q. Was it your practice to apply for foreign patents in all cases where you applied for American patents?

A. No, sir.

54 X Q. In what proportion of the cases did you apply for foreign patents between the dates named. Please answer approximately?

A. I should say eighty-five per cent.

55 X Q. You applied for an English patent on or about November 20th, 1879, patent for which was issued and numbered 4576 did you not?

A. Yes, sir.

A printed copy of same is here offered in evidence marked "Swan's Exhibits Edison's English Patent 4576."

56 X Q. You also applied for an English patent on or about December 15th, 1879, patent for which was issued and numbered 5127, did you not?

A. Yes, sir.

A printed copy of the above patent is put in evidence and marked Swan's Exhibit Edison's English Patent 5127.

57 X Q. On or about December 11th, 1879, you made an application for a patent in the United States did you not, in which you described the mode of manufacturing carbons by cutting them with dies in the shape in which they were to be carbonized and then carbonized them?

A. Yes, sir; I believe I did.

58 X Q. That application contains the following language, does it not. "I make use of paper of the desired thickness as free as possible from foreign substances or adulterations, and for this purpose I prefer and use 'bristol-board.' With suitable instruments, such as a punch and die, I cut out a narrow strip of this paper, pref-

erably in the form of an elliptical bow or an arc of a circle,
2556 the ends of the strip being by preference wider than the other
portions. A number of these pieces of paper are laid flatwise in the bottom of a mould, preferably of wrought iron, and there is laid on them a light weight in the form of a flat piece of gas-retort carbon or other device that will not be distorted by the heat. If several of these are laid one on the other in the mould, a piece of tissue paper is interposed between each one and the next. A cover is used to close the mould and the mould is raised very gradually to a temperature of about 600 degrees Fahr. This allows the volatile portions of the paper to pass away and at the same time the mould retains the paper in its proper shape and the paper is prevented from curling up or becoming distorted as it would be likely to do if the heat was applied suddenly, or the light weight dispensed with. The mould is now placed in a furnace and heated almost to a white heat and then removed and allowed to cool gradually. Figure 5 is the paper blank before it is carbonized. The blank *a* is cut out of paper material such as 'bristol-board,' in the proper shape, the form shown in figure 5 is preferred, the same is laid in the metal mould *b*, and when several are laid one on the other, pieces of this paper are introduced between. The weight *d* is laid on these; it is to be heavy enough to prevent the paper curling up under the action of the heat, but it allows the paper to contract as the volatile matters are expelled by the heat. This weight *d* is of gas-retort carbon. The cover *e* is placed on the mould and secured, and the mould is heated as before described."

This question and all previous questions relating to this application are objected to by counsel for Edison, as incompetent, immaterial and irrelevant.

A. Yes, sir; if the paper I read from is correct.

59 X Q. Have you any reason to think it is not correct?

A. No, sir.

2557 60 X Q. Corresponding language is found in the English
patent No. 5127, copy of which is just put in evidence, is it
not?

A. It is the same.

61 X Q. Figure 5, referred to in the United States application, was the same as figure 5 of the English specification, was it not?

A. Yes, sir.

62 X Q. At the time of applying for an English patent in November, 1879, copy of which is put in evidence as number 4576, you also applied for a United States patent covering substantially the same ground, did you not?

A. Yes, sir.

63 X Q. With the exception of these two applications, did you make any other application for any kind of a paper carbon till you filed the present application in May, 1881?

A. Yes, sir; patent 239,372 refers to paper carbons; also an application filed October 30, 1880; also patent No. 239,151, filed November 24th, 1880; also an application December 15th, 1880.

64 X Q. State briefly what the applications of October 30 and December 15th, 1880, were about?

Objected to as incompetent, immaterial and irrelevant, and the witness is instructed that he need not answer the question.

A. Electric lamps.

64½ X Q. Have they anything to do with the issues of this interference? If so, what?

A. Nothing more than that when I made an application for a patent for an incandescent conductor made of paper, I did not suppose it was necessary to file an application for every variety of paper, red, blue, green, parchmentized, manilla, bamboo or other kinds of paper. These applications speak of an incandescent conductor of paper, and in that respect do not exactly meet the count in this interference.

2558 65 X Q. In what other countries was it your habit to make applications for patents for inventions, patents for which were applied for in the United States?

Objected to as incompetent and immaterial.

A. Most all countries that have patent laws.

66 X Q. What is the number of the present application for a patent in this interference, and what does that number signify?

A. It is number 311. It signifies that it is the number of applications up to that date taken by me in the last ten years.

67 X Q. I see that the caveat, copy of which was put in evidence by you, called Caveat I, second issue, March 26th, 1883, is No. 93. What does that number signify?

A. It signifies the number of caveats that have been applied for by me within the last ten years, on different inventions.

68 X Q. In what countries were patents applied for or taken by you for the inventions forming the subject-matter of the English letters patent 5127?

Objected to as incompetent and immaterial.

A. I do not know, but think most of the countries having patent laws.

69 X Q. Same question as to English patent No. 4576?

Objected to as incompetent and immaterial.

A. I do not know, but think most of the countries having patent laws.

Counsel for Swan asks the commissioner to mark the sixth bulletin as follows: "Swan's Exhibit Edison's Bulletin;" and he offers in evidence that part of the pamphlet commencing with "Edison's patents," at the bottom of page 5, through the pamphlet.

2559 Objected to as incompetent, immaterial and irrelevant.

70 X Q. (The twelfth bulletin of the Edison Electric Light Com-

pany, under date of July 27th, 1882, is handed the witness.) By whom was this bulletin, as well as the sixth bulletin, issued?

A. By the Edison Electric Light Company.

71 X Q. With your knowledge?

A. I did not see it until it was printed.

72 X Q. You knew of their issue at or about the times of their dates, did you not?

A. I knew after they were issued.

73 X Q. How soon after?

A. A day or two.

74 X Q. On page 13 of the twelfth bulletin the following language is used, is it not: "Mr. Joseph Wilson Swan, of England, after whom the 'Swan lamp' is named, has only two patents in the United States relating to incandescent electric lamps. The first, No. 233,445, was applied for April 12th, 1880, and granted October 19th, 1880; the second, No. 234,345, was applied for June 16th, 1880, and granted November 9th, 1880. These are the only patents on the 'Swan lamp' in the United States;" and on page 15 the following: "The second claim in Mr. Swan's first patent is for a straight strip of paper bent into a loop or horseshoe. This was the form first used by Edison, and probably by every other experimenter on lamps. But Edison improved upon it. His improvement consists of cutting the paper into shape, instead of bending it, it being evident to any one that by cutting paper into exact shape greater uniformity of result can be obtained than by bending, and no special care or work is needed in ensuring that all loops shall be uniform.

"The third point in Swan's first patent, and the first point of
his second patent, is parchmentization prior to carbon-
2560 ization. Edison tested this as early as 1878 and he
soon after mentioned it in a caveat, but he found no
gain in this additional step of parchmentization. Besides, it cost money and increased the cost of production of the finished lamp." And on page 16 the following: "It thus appears that Mr. Swan's so-called improvements on parts of the incandescent lamp are, commercially speaking, of little value. Every point claimed by Swan is something discarded by Edison in his march towards simplification, which means the best result, and the best service for the least money." And on pages 19 and 20 the following: "3d. All that Mr. Swan claims are only some minor features of the alleged improvements, but it is doubtful if they really are improvements, all of them having been tried and discarded by Edison, for simpler and more economical means equally or more efficient for the ends sought, long before Mr. Swan's patents were issued."

Objected to as incompetent and immaterial.

A. Yes, sir.

75 X Q. How extensively were these little printed bulletins circulated?

A. I believe they were circulated only to our stockholders, and later to some others.

76 X Q. There is a notice to that effect, is there not, at the head

of the bulletin reading as follows: "These bulletins, originally issued as a convenient way of answering the inquiries of distant agents, are now, in response to numerous requests, sent also to all stockholders, to give them information of the progress of the company and of other matters of greater or less interest connected with electric lighting. Agents are particularly requested to communicate to the vice-president whatever practical points of general interest may be developed by their experience in installing or operating our lights."

A. Yes, sir.

2561 The twelfth bulletin is marked "Swan's Exhibit Twelfth Bulletin," and the parts above quoted by Swan's counsel are put in evidence. Exhibit objected to as incompetent, immaterial and irrelevant.

Recess here taken for an hour.

77 X Q. You knew of the preparation of an article which appears on page 531 and following pages of Scribner's Monthly for February, 1880, entitled "Edison's Electric Light," did you not?

A. I saw some of the manuscript while being prepared.

78 X Q. You furnished the editor of that magazine with a letter headed as follows, did you not?

"Editor Scribner's Monthly.

Dear Sir: I have read the paper by Mr. Francis Upton, and it is the first correct and authoritative account of my invention of the electric light.

Yours truly, THOMAS A. EDISON.

Menlo Park, N. J."

A. I furnished such a letter after reading a portion of this communication which was written in a popular manner and not in an accurate and scientific manner for scientific persons. It deals very generally with the details.

79 X Q. About when did you write that letter?

A. I should say a month or two before the magazine appeared.
Mr. Upton was called upon by the proprietors of that magazine to
write a popular article on electric lighting, and I gave him permission
to write such an article, and the proprietors of the paper, desiring
to make it perhaps more striking, obtained a letter from me
to the effect that it was authoritative and accurately described; but
I desire it understood that this article is not written for a sci-
2562 entific journal, but for a public who know nothing about the
scientific part of the subject, and therefore it does not give
details, but only generalities. A large portion of the article written
by Mr. Upton I never saw until the magazine appeared, but relied
entirely upon his statements that it would be satisfactory, and no
misstatements would be made.

79½ X Q. You find the following in that article do you not: "A long time was spent, with a fair degree of success, in seeking to make a spiral of lamp-black tar in the form of a wire. To hold this together he used a bit of ordinary sewing cotton, which was covered with lamp-black and succeeded in producing from an inch and a half of this simple thread, bent into an inch, a light equal to an ordinary gas jet. The lamp-black, however, contained air, which greatly interfered with the success of the method. He then used a simple thread, which he found to answer the purpose, though it presented the objection of being fragile, uneven in texture, and unmanag-able. This difficulty suggested the use of charred paper, cut into a thread-like form. The difficulties apparently so insuperable melted away. The electric lamp was completed. A piece of charred paper cut into horseshoe shape, so delicate that it looked like a fine wire, firmly clamped to the two ends of the conducting and discharging wires so as to form part of the electric circuit, proved to be the long-sought combination. From this a light equal in power to twelve gas jets may be obtained. Fig. 8.

"The process by which the paper is rendered serviceable is also extremely simple and inexpensive. The horseshoe loops are cut from card-boards, and placed in layers within an iron box, with tissue paper between; the box is hermetically sealed, and then raised to a red heat. Nothing remains but the carbon loops and the carbonized tissue paper. All other forms of carbon previously used had presented the difficulty of containing air or gas?"

A. I do; but the statement is not absolutely correct, but quite sufficient in an article of that character.

2563 80 X Q. Name all the different kinds of paper you experimented with in the latter part of 1879 in making carbons for electric lamps.

Objected to as incompetent and immaterial.

A. I have used bristol-board in various colors, paper made from manilla, bamboo paper, paper of which the United States currency is printed upon, parchmentized paper, linen paper, tissue paper, straw paper, and others that I do not remember.

81 X Q. Have you tried blotting paper, bibulous paper?

A. Yes, sir. I tried uncalendered bristol paper so that I could select the proper thickness, but this paper was pressed under a press to make it hard before use.

82 X Q. Did you try bank-note paper?

A. Yes, sir.

83 X Q. Bond paper?

A. Yes, sir.

84 X Q. In the case of carbons made by you consisting of a foundation of paper thread or other substance, and having a coating of carbonized tar or lamp-black, what was the source of light?

A. The filaments.

85 X Q. What part of the filament?

A. The outside.

86 X Q. Consisting of what?

A. Carbon.

87 X Q. Produced from what?

A. From the carbonization of the volatile matters of the cellulose and the tar.

88 X Q. Did the cellulose and the tar form a homogeneous structure?

A. Not perfectly homogeneous, although the tarry products of the cellulose mixing with the tarry products of the tar, coalesced to form a carbon, which, although not perfectly homogeneous, was partially so.

2564 89 X Q. You think that a portion of the light was furnished by the carbon, which was the result of the interior filament, do you?

A. If, as was the case, a very little tar was put on the material, the portions of the filament would be exposed and radiate light directly, but as a matter of fact the surface of paper, bamboo and other forms of cellulose, when carbonized, give off tarry matter, which, running out upon the surface, becomes carbonized, and generally the surface thus formed by the carbonization of the tarry matters produced by the decomposition of the cellulose is the carbon that radiates light. There is a large amount of tarry products in the decomposition of cellulose.

90 X Q. In the production of carbons cut out in moulds of the shape of horseshoe or of circular shape and carbonized in moulds, what was the object of the tissue paper that was placed between the blanks?

A. If I remember right the object was to prevent the tar which resulted upon the decomposition of the cellulose and paper from running and sticking the carbon to the mould. Also to permit the the loop to contract upon the surface of the tissue paper.

91 X Q. Why was not tissue paper used in connection with the carbons that were cut straight and bent round the little blocks of carbon that had been produced in evidence?

A. Because the weight was not applied to all of the filaments, but each single filament was separate and was kept straight by its pulling a weight; but with the several filaments, one upon the other, cut from blanks, one weight was used, hence something must be placed between the filaments, so that they could contract independent of each other.

92 X Q. Was the use of tissue paper in connection with experiment seventy-one, on page 163 of Note Book Fifty-two, such as you have just described tissue paper to be used for, and will you compare the note on page 153, reading as follows: "All that we have made like forty-three are cut crossways out of the card" with
2565 the language applied to seventy-one on page 163, as follows:
"The card cut lengthways so that grain (as it were) lays that way," and explain a little more fully what you mean by cutting crossways and cutting lengthways?

A. We used various kinds of tissue paper. The meaning of cutting lengthways and crossways of the bristol-card was that in the making of the paper the fibres generally lay more in one direction than another, owing to the action of the machinery, and therefore cutting one way or the other did not make a difference in the numbers of the fibres that laid parallel. I think what is meant by carbonizing with white tissue paper is that the tissue paper was used to separate the blanks in the mold.

93 X Q. Did it require a different cutter to cut them with the grain lengthways as mentioned with reference to 71, from cutting them crossways as mentioned with reference to 43, or was it only a different application of the same horseshoe or loop shaped cutter?

A. I do not think it required any different cutter. I do not see why it should.

94 X Q. Then I suppose 71 differed from 43, in that 71 was cut lengthways with the grain and 43 crossways with the grain, being otherwise the same?

A. So the exhibit states.

95 X Q. In carbonizing the loops that were bent round the bits of carbon, how were they secured to the carbon?

A. In various ways.

96 X Q. Please tell how?

A. The ends of the filaments were sometimes secured by wedges of carbon, and by tying them round a piece of carbon. Sometimes one end was secured and the other end tied to a piece of carbon. Sometimes the weight placed in between the loop was held fast, and the block of carbon to which the ends of the filament were tied moved. Sometimes that was stationary and the piece of carbon between the loop moved. Sometimes a groove in a block of
2566 carbon the shape of the filament was made and the filament placed therein and allowed to contract in the groove without securing the end.

97 X Q. Over what period were books like Record Book 52 kept?

A. I think they were kept up from the fall of 1878 until some time in 1881. They are not very full, and very few of the pages are dated, for the reason that we were under great strain, the place was crowded with people; I had thirty or forty assistants, and I sadly neglected my usual care in dating exhibits and recording all experiments, as I had previously done accurately with regard to the telephone. I really had not time. Had I thought at the time that my application for an incandescent lamp wherein paper was used did not cover all kinds of paper I certainly should have made a very voluminous record of experiments with parchmentized and other kinds of paper.

Last part of the answer beginning with the words "had I thought," and continued down to the end is objected to as irresponsive, and the witness is requested to answer questions simply and not endeavor to excuse himself at this late day for what he now seems to consider an oversight.

A. I have not endeavored to excuse myself as there is quite sufficient records to meet this case.

98 X Q. On page- 137 and 139 immediately following a drawing on page 136, which was stated in the testimony to represent a blank cut from paper in its present shape, I find the following language:

"November 12th, 1879. In order to bring the cards out of carbonizing chamber perfectly straight we found the only way was to put sheets of tissue paper in between the loops (instead of cards as we had been using), and after six alternate layers of loops and tissue sheets to put a small piece of carbon to act as a light weight on top, then close the whole up in a chamber and heat very slowly, taking care not to get too great on it until after all the volatile matter has gone off which will be known after it has given over smok-
2567 ing, then put in furnace and bring to a yellow heat." This reference to tissue paper and method of carbonizing is what you have heretofore referred to as having been accomplished in the molds, is it not?

A. I have heretofore referred to the fact that I have used tissue paper between the loops for permitting them to contract. This also speaks of the use of tissue paper between the loops to permit them to contract.

99 X Q. The drawing on page 145 opposite 43 in pencil represents the new model from which the paper blanks numbered 43 and 44 were cut, does it not?

A. I believe it does.

100 X Q. This drawing shows that the blanks were cut from paper in the form of a horseshoe, does it not?

A. Yes, sir.

101 X Q. Look at page 207, Record Book 52, and state if you can what kind of paper was used in making carbons 141, 142 and 143?

A. I think they were punched-out carbons in horseshoe shape.

102 X Q. Is there anything there that tells you what kind of paper they were punched from?

A. No, sir.

103 X Q. What was the object of the weight of 126 grains Troy of carbon which appears from that entry to have been used?

A. I believe it refers to the size of the weight of carbon which was placed on top of filaments while being carbonized.

104 X Q. Do you understand that the three horseshoe blanks referred to there, to wit: 141, 142 and 143, were laid one on top of the other, and a weight on top of the whole, and the three then carbonized.

A. Yes, sir; I think that it is the way it was done.

105 X Q. Please examine the pages of this Record Book, No. 52, from page 137 to 280, the last page of the book, and refer to the numbers of the lamps therein referred to, and of which a
2568 separate record is made running from number 43 to 260,
and state if the record shows that each of the carbons for them were cut from paper in the form of a horseshoe blank and then carbonized.

A. As far as I have been able to discover they do except numbers 53 and 54, which were models for Patent Office. What these were I cannot remember.

105½ X Q. Numbers 53 and 54 occur on page 151, do they not, and also on the page occurs the date November 23, 1879, does it not, and on the preceding page, namely, 149, occurs the date November 20th, 1879, and the whole entry with reference to 53 and 54 is as follows, is it not?

"53 }
54 } made as models for Patent Office."

A. Yes, sir.

106 X Q. On page 135 I find the following entry: November 11th, 1879. Made chamber for carbonizing, and cut out piece so and carbonized number in between the cards. They came out excellent." In the margin is a drawing representing a carbon cut out in horseshoe form. Will you examine this Record Book 52, and see if you can find therein, prior to this citation, any commendatory word relating to a carbon filament, and if you do, quote it?

A. I find no commendations previous to November 11th, 1879, in this particular book, but I believe there are commendations of a filament of carbon in another book now in evidence. I think the results of the lamps are entered in some other book, where perhaps the commendations might be found if there were any to commend it.

107 X Q. You find a good many remarks that are the contrary to commendatory of carbon filaments, in this book prior to page 135, do you not?

A. No, sir; I do not find one. I find that we had difficulties in carbonizing them. We were very fresh in the business, and they were more difficult to manipulate than those cut out of paper, because with those cut flat it was very much easier to get the proper pressure on them and strain, so as to make them even; and besides a great number could be put in a mold, while with the straight carbons each carbon had to have its own little rigging. The *re*remarks, "bursted in carbonization" has nothing to do with the commendation or non-commendation of the filament of carbon, or that the glass bursted or the inside bursted. These are not derogatory to the filament of carbon. As soon as we became more expert in the business, we went back to the early method, and cut out filaments straight, bent them, and carbonized them while so bent, and have continued this use ever since, having made over a quarter of a million in this manner. 2569

Last part of the answer about continuing to use, and number of lamps made, is objected to as irresponsive.

108 X Q. In this D. B. E. in regard to the quarter of a million that you say were made and put in the market, you include the bamboo filament of your present manufacture, do you not?

A. Yes, sir.

Counsel for Swan requests of counsel for Edison the privilege of putting Record Book 52 in evidence bodily, being willing to stipulate that the book may remain in possession of counsel for Edison, except for such at hearings and examinations as may be required.

Counsel for Edison requests counsel for Swan to state how the portions of the Note Book 52, photographs of which are not in evidence, are material.

Counsel for Swan will undertake to show that on hearing. Counsel for Swan would add that the record book in question contains an unbroken record of a continuous line of experiments with carbons for electric lamps, numbered consecutively from 1 to
2570 260, and such being the fact, the proper bearing and importance of the parts put in evidence by counsel for Edison can only be shown by an inspection of the whole record.

Counsel for Edison states that even assuming that the record book in question contains records of a continuous line of experiments with carbons for electric lamps, that does not show the materiality of other portions of the record book than such as relate to the issues in this interference, and that as those portions of the record book relating to such issues have been put in evidence, the rest of the book is immaterial and has no proper place in the record. Counsel for Edison is unwilling to permit any further use of the record book in question than is provided for and stipulated in the stipulation contained in folios 20 to 22 of the printed record.

109 X Q. At the top of page 171 I find the following: "Tests of papers and card-boards for ash." What does that mean?

A. It means that the manufacturers loaded their paper with clay and other materials and we desired to ascertain what amount of these adulterations were used in different samples of paper.

109 X Q. How many different samples were tried for ash, as appears by this record?

Objected to as immaterial and incompetent.

A. About 40.

100 X Q. Is parchment paper or parchmentized paper mentioned in that list as having been tried?

A. No; for the reason that manufacturers do not put adulterations in parchmentized paper.

111 X Q. Will you produce the record book immediately succeeding Record Book No. 52, and containing a continuation of the numbers of carbons from 260 onward?

A. No, sir; I have produced sufficient records to meet the counts in this interference.

2571 112 X Q. Look at the printed copy of evidence in case of Sawyer-Man *vs.* Edison, now handed you, and state whether you testified as recorded in that volume from page 2 to page 88, and page 134 to page 141, inclusive.

A. Yes, sir; I believe I did.

Counsel for Swan offers the same in evidence as marked, "Sawyer-Man *vs.* Edison, Swan's Exhibit Edison's Deposition."

Objected to on the ground that the same is incompetent and immaterial unless offered for the purpose of contradicting or impeaching the witness, in which case the witness's attention should be called to the specific statements upon which such contradiction is sought to be based.

113 X Q. How was the material which you got from the Vulcanized Fibre Company, Wilmington, made?

A. It is made, I understand, by treating the paper with a strong solution of chloride of zinc, which parchmentizes the fibres so they all coalesce to form a non-fibrous mass.

114 X Q. You have stated that, in the latter part of 1880, you made a number of lamps with carbons made of vulcanized fibre. Give the names of the assistants employed in making such carbons.

A. I think the man who made the carbons was named Bradley. I think Mr. Batchelor made a lot at first. Afterwards Mr. Bradley made a few. After that we got some of the paper stock from the Wilmington company, when a large number were cut out. Mr. Bradley also had two or three assistants whose names I cannot remember. I think one of these men cut a large number for me.

115 X Q. Was the provisional specification of English patent No. 5127 cabled ab*oard*?

A. No, sir; but the Philadelphia correspondent of the London Times four or five days after I made my exhibition at Menlo Park, or started to make the exhibition, and about six days after 2572 the New York Herald published a full account of my lamps, which was December 24th, 1879, telegraphed to the London Times a full and complete description of the lamp sufficient to permit one skilled in the art to make the same and it was published in the London Times I think either the 29th of December, 1879, or the first or second of January, 1880, from which description Mr. Swan in about fifteen days afterwards filed a patent application in the British patent office, containing almost a similar lamp as that described in the cable to the London Times.

All after the word "no, sir;" is objected to as irresponsive, not called for by the question and volunteered by the witness.

Adjourned to Friday, May 25th, at 10 o'clock a. m.

Met pursuant to adjournment.

Present: W. C. Witter and H. A. Seymour for Swan; S. A. Duncan for Maxim and Richard N. Dyer and E. H. Lewis for Edison.

Counsel for Edison here offers in evidence copy of an article from the London Times of December 23d, 1879, entitled "Mr. Edison and the Electric Light," and also a copy of an article from the London Times of December 29th, 1879, upon the same subject, and requests that these copies be marked Edison's Exhibits R and S respectively.

Counsel for Swan here gives notice that he will introduce in evidence printed copies of such patents as he has referred to in his cross-examination and of which no special notice of an intention to introduce has heretofore been made.

116 X Q. Will you please produce to be put in evidence in this case the original agreement dated November 15th, 1878, between the Edison Electric Light Company and Thomas A. 2573 Edison, or a correct copy thereof to have the same effect as the original?

A. No, sir.

117 X Q. In default of the best evidence counsel for Swan produce a document and asks the witness whether that is a correct copy of the instrument called for.

A. I cannot say, for I have not the original for comparison.

Counsel for Swan calls upon the counsel for Edison to produce the original in order that it may be compared with the copy here presented.

Counsel for Edison here refuses to produce the original agreement called for on the ground that it is wholly immaterial and irrelevant.

The copy presented is here put in evidence and marked "Swan's Exhibit Agreement of November 15th, 1878."

The exhibit is objected to as incompetent, immaterial and irrelevant, and also as not being the best evidence, no sufficient foundation for the introduction of the same having been made, and no identification of the same as a copy having been made.

Counsel for Swan reads to the witness Edison the copy agreement produced, as follows:

This agreement, made the fifteenth day of November, in the year one thousand eight hundred and seventy-eight, between Thomas A. Edison, of Menlo Park, New Jersey, party of the first part, and the Edison Electric Light Company, a corporation created and existing under the laws of the State of New York, and hereafter called "the company," party of the second part,

Witnesseth:

Whereas, the company has been organized with the view of becoming the owner of, and of making, using and vending, and licensing others to make, use and vend within the United States and other countries or colonies hereinafter mentioned, all the inventions, dis-
coveries, improvements and devices of said Edison, made or
2574 to be made, in or pertaining to electric lighting, or relating
in any way to the use of electricity for the purposes of power,
or of illuminating or heating, or relating to improvements in electric engines, or to the developing of electric currents by machines or otherwise, for any use or purpose, except electric telegraphy;

And whereas, the said Edison is willing and desirous, in order to obtain the means to continue his investigations in the subjects above named, to transfer, upon the terms heretofore agreed upon, and hereinafter fully set forth, all the right, title and interest in his said inventions, made or to be made, as herein provided, and the exclusive use thereof in the countries above named, together with all letters patent of the United States or Canada, and all letters patent, special grants, concessions or privileges of any other state or country of North or South America, excepting the possessions of Spain, which may be granted for any of said inventions, discoveries, devices or improvements.

Now therefore, in accordance with said terms, and in consideration of the mutual agreements of the parties hereto, as herein set forth, they respectfully agree with each other as follows:

First. The said Edison hereby sells and assigns to the company

the entire right, title and interest in and to all inventions, discoveries, devices and improvements which he has hitherto made pertaining to electric lighting or to the use of electricity for the purposes of power, or of illumination or heating, or to improvements in electric engines, or to the developing of electric currents by machines or otherwise for the uses or purposes above mentioned, or any of them; and especially all inventions, discoveries, devices and improvements which are described in the following applications and caveats for patents of the United States, namely, an application in case No. 156, dated October 5th, 1878, filed October 14th, 1878; applications in case No. 162 and No. 163, prepared by L. W. Serrell & Son, but not yet signed; in caveats numbered 82, dated October 7th, 1878; 83, dated October 25, 1878; 84, dated October 12, 1878;
and 85, dated October 25, 1878; and also those which are
2575 described in a certain application, and the papers thereto per-
taining to letters patent of the Dominion of Canada, dated October 25th, 1878; and does also agree that all other inventions, discoveries, devices and improvements of the character above described, and all improvements which he may make within the period of seventeen years from the date of this instrument shall be deemed to have been made for and shall belong to the company; and that he will take all such steps as are provided in the third article hereof to secure to the company letters patent of the United States and Canada, and such letters patent or other special grants or concessions of any other State or country of North or South America, except the possessions of Spain, as can be secured from them, or any of them. It being specially understood and provided, however, that this agreement is not intended to convey or give any interest to the company in any invention designed, or to give any right of use for electric telegraphy, or capable solely of being used in electric telegraphy of any invention which may be applicable to that as well as to any of the other purposes which are the subject, as above named, of this agreement, but the right of use of any invention, discovery, apparatus or device contemplated by this agreement for electric telegraphy remains in said Edison, and the company agrees to grant, under any letters patent belonging to it, such licenses for his benefit as he may request for the business of electric telegraphy.

Second. All inventions or discoveries of the character described in the first article hereof which may be made by said Edison within the first five years of the period above named, and all improvements which he may make during the same period upon any of such inventions, devices or improvements shall belong to the company without further consideration; but compensation shall be due for all inventions or improvements made after the expiration of said
five years; and immediately upon the issue of any letters
2576 patent, grants, concessions or privileges for inventions, discov-
eries, devices or improvements made after the expiration of said five years, if the company desires to hold such inventions and patents, such compensation shall be due and payable, and if the parties are unable to agree within three months from the date of

such letters patent, grant or concession, upon the amount and the time, conditions and manner of payment of such compensation, the same shall, upon the written demand of either party, be submitted to arbitration of two indifferent and disinterested persons, one to be chosen by each party, with power to choose a third, and the decision of such arbitrators, or a majority of them, shall be final and binding upon both parties.

Third. The said Edison agrees that, in respect to all the inventions and improvements herein provided for, he will promptly file, in the proper offices of the United States and Canada, such caveats as may be necessary, in the judgment of the company, to protect the same, and will also promptly thereafter file his applications in the same offices for letters patent therefor, with requests that such letters patent may be issued to the company, as sole owners thereof, whenever the law allows, and will, simultaneously with the filing of such caveats or applications, also deliver to the company special assignments to it of all the right, title and interest in and to such inventions and improvements.

And said Edison also agrees to prepare or cause to be prepared such drawings, models and specifications of the inventions and improvements provided for by this agreement, as may be necessary, in the judgment of the company, or as may be required by it, to describe and illustrate them fully, and to deliver the same, with all sketches or memoranda pertaining to them, to the company, and at all times, upon the request of the company, to make, execute and deliver to it all amended specifications, models, drawings or applications that it may reasonably require; and all new or other assignments that may be necessary to secure to the company the exclusive ownership of all the inventions, discoveries, devices
2577 and improvements intended by this agreement in their most perfected form, together with all papers required to secure reissues, renewals or extensions of letters patent, grants or concessions for any of them.

And said Edison agrees, from time to time as requested by the company, to take all such other measures as may be necessary to procure letters patent or other grants or concessions, protecting his inventions, in such other States or countries of North or South America, except the possessions of Spain, and to assign to the company, immediately upon receipt of them, all such letters patents, grants, concessions or privileges, which may be issued in the first instance directly to him; but the expense of all things done in accordance with the provisions of this agreement, except as otherwise specially provided in the fifth article hereof, are to be borne by the company.

Fourth. The said Edison agrees on behalf of and for the benefit of the company, to prosecute with his utmost skill and diligence, further necessary investigations and experiments upon the use of electricity for the purposes described in the first article, and to endeavor to discover and devise the best and most economical means, modes and apparatus for applying electricity to the purposes above named, and for rendering the means, modes or apparatus which he may have discovered or devised, more useful, economical and convenient: and to perfect and complete all his inventions and improvements described in the first and second articles, and all such as may result from the further investigations and experiments herein provided for, as far and as fast as may be in his power.

Fifth. The company hereby agrees to issue to said Edison two hundred and fifty thousand dollars of its capital stock of three hundred thousand dollars and to pay him, upon the execution of this agreement, the sum of thirty thousand dollars in cash—of which sum said Edison agrees to expend twenty-five thousand dollars, or so much thereof as may be necessary, in procuring and paying 2578 for the means and material required for the most effective prosecution of the investigations and experiments provided for in the fourth article hereof, and in defraying all other charges attendant upon such investigations and experiments, as well as the legal or other expenses attendant upon the organization of the company, and the preparation and taking out of patents in the United States and Canada for his inventions already made and described in the caveats and applications above referred to.

Sixth. The company further agrees, out of its first net earnings, remaining after reserving fifty thousand dollars, or so much thereof as may be required to repay the sums paid in cash by the subscribers to its capital stock, to pay to the said Edison the further sum of one hundred thousand dollars in cash; and thereafter to pay him an annual royalty upon every light licensed or used with its consent under any of the patents of said Edison, of five (5) cents per light; and guarantees to pay in each year royalties to an amount not less than fifteen thousand dollars a year, if it has net income to that amount in that year from any source; provided, however, that the company shall have the option, by notice given on the first day of January in any year, to pay thereafter a yearly commutation of thirty thousand dollars in lieu of all royalties derived under patents of the United States and Canada; and the like option, upon similar notice, to pay thereafter annually the sum of twenty thousand dollars in lieu of all royalties or income derived under patents, grants, concessions or other rights secured to it in the other States or countries above named.

Seventh. The company hereby covenants with the said Edison that it will, in so far as the same may be practicable and economical, seek with diligence and good faith to introduce, as extensively as possible in all the countries named in this agreement, the electric light produced by means and apparatus invented by said Edison, as well as to bring all such means and apparatus into like use for all the other purposes contemplated by this agreement.

2579 Eighth. The said Edison agrees, at the request of the company and at its expense, to execute and deliver, from time to time, such writings of further assurance, such separate instruments making special assignments of the interest of any portion thereof conveyed hereby, or such special powers or authorities as for its convenience or interest it may desire to have separate from the general body of stipulations herein contained.

Ninth. The several agreements and covenants of the parties hereto shall bind and shall enure to the benefit of, respectively, the executors, administrators, and assigns of Edison and the successors of the company.

In witness whereof, the party of the first part has hereto set his hand and seal, and the party of the second part has hereto caused its corporate seal to be affixed, and its corporate name to be subscribed the day and year first above written.

THE EDISON ELECTRIC LIGHT COMPANY.
By NORVIN GREEN, *President.* [L. S.]
THOMAS A. EDISON. [L. S.]

Signed, sealed and delivered in the presence of—
[SEAL.] FRANCIS R. UPTON.
CHARLES ROTH.

Attest: C. GODDARD, *Sec'y.*

STATE OF NEW YORK, } ss:
City and County of New York, }

On this fifteenth day of November, one thousand eight hundred and seventy-eight, before me personally came Norvin Green and Calvin Goddard, to me known to be respectively the persons 2580 described in and who executed the foregoing instruments as the president and secretary respectively of the Edison Electric Light Company, the corporation described in and in whose behalf the same instrument was by them executed, and they severally acknowledged to me that they executed the same as the free act and deed of said company for the uses and purposes therein mentioned, and thereupon the said Norvin Green being by me duly sworn, said that he resided in the city of New York; that he was the president of the said Edison Electric Light Company, and that he signed the name of the said The Edison Electric Light Company and his own name as president thereof, by order of the board of directors of said company; and the said Calvin Goddard, being by me duly sworn said that he resided in the city of New York; that he was the secretary of the said The Edison Electric Light Company; that he knew the corporate seal of said company; that the seal affixed to the foregoing instrument was such corporate seal and was affixed by him by order of the board of directors of said company, and by the like order he signed his own name to said instrument as secretary of said company.

And on the same day before me personally came Thomas A. Edison, to me known to be the individual described in and who executed the foregoing instrument and acknowledged to me that he executed the same for the uses and purposes therein mentioned.

In witness whereof, I have hereunto subscribed my name and affixed my official seal the day and year first above written.

CHARLES ROTH,
[L. S.] (67) *Notary Public, N. Y. Co.*

118 X Q. Did you not, on or about November 15th, 1878, make with the Edison Company an agreement substantially to the effect of the above?

2581 Counsel for Edison objects to the question on the ground that if such an agreement was made, and is in writing, the document is itself the best evidence of the nature and substance of the agreement. On the further ground that the question is immaterial, irrelevant and incompetent, and the witness is instructed that he need not answer same.

A. I am instructed by my counsel not to answer the question.

119 X Q. Did you not make, about November 15th, 1878, with the Edison Company, an agreement that you would promptly file, in the proper office in the United States and Canada, caveats and applications for letters patent for all inventions and discoveries made by you pertaining to electric lighting, or the use of electricity for the purpose of power or of illumination or heating, or improvements in electric engines, or for the development of electric currents, by machines or otherwise, for the uses or purposes above named, for the benefit of the Edison Electric Light Company?

Question objected to as incompetent, immaterial and irrelevant, it appearing that counsel is reading from a paper purporting to be an agreement or a copy of an agreement. The question is improper because it is not the best evidence of the nature or substance of the agreement in question and is objected to by counsel for Edison on that ground as well as the general grounds above mentioned. The witness is instructed not to answer.

Cross-examined by S. A. DUNCAN, Esq., counsel for Maxim:

120 X Q. Is it a fact that your notes and records of experiments relating to the telephone were much fuller and more accurate than those relating to the electric light?

A. Yes, sir.

121 X Q. Why was this so?

A. Because I only had two or three assistants. We had more time, and I did a great portion of the work myself, whereas 2582 with the electric light I had 20 or 30 assistants and things were going on with a great rush, and I could not make all the records myself.

122 X Q. Did you make your own records in the case of the telephone?

A. Most of the records were made by myself in the case of the telephone.

123 X Q. In the case of the electric light the records of experiments were made largely by your assistants, were they not?

A. Yes, sir; I detailed different men for different work, with instructions to keep records.

124 X Q. When did your records of experiments on the electric light begin?

A. In the fall of 1878.

125 X Q. When did this great rush of which you have spoken of begin?

A. About the same time. I put on a great force of men, being furnished with funds by the company which was organized to take over what inventions I might make.

126 X Q. Did that company also have the right to control what inventions you had previously made relating to the electric light?

Objected to as incompetent and immaterial.

A. I forget now the wording of the contract.

127 X Q. I did not ask for the wording of the contract, but the substance of it in this one particular.

Same objection.

A. I cannot give the substance, nor cannot remember whether they did or did not have the right.

128 X Q. When did you first begin experimenting on the electric light?

A. I have experimented more or less since 1864 with the electric light.

129 X Q. When did you first experiment with incandescent carbons for electric lamps?

A. In 1869, is the first that I now remember.

2583 130 X Q. Was it your instructions to your assistants to make a record of all important experiments relating to the electric light?

A. Yes, sir; they were told to put down what the result of their experiments was.

131 X Q. So far as you know is there anything of importance to be found in your record books bearing upon the subject-matter of the present interference which has not already been produced in evidence, or which does not constitute a part of Record Book No. 52?

A. I do not know. I find the books now in evidence contain sufficient data in my mind for the purpose of this interference. There may be other things in other books relating to the subject-matter of this interference.

132 X Q. Did you examine this book, No. 52, in order to ascertain its bearing upon this interference?

A. After it was produced I did.

133 X Q. Have you examined any other of your record books for the same purpose?

A. I do not remember of having examined any of them.

134 X Q. In your answer to cross-questions, propounded by counsel for Mr. Swan, you made some reference to your application for a patent on paper carbon; I suppose you regard that as an important application, do you not?

Objected to as immaterial.

A. In some senses I do, and in other senses I do not.

135 X Q. In what sense not?

A. That it — not so good material for incandescent lamps as other materials which I have used.

136 X Q. Still you deemed it very important, did you not, to control by means of a patent the use of paper carbons for incandescent lamps, and in that respect did you not consider that application a very important one?

Objected to as immaterial.

2584 A. I considered it important in respect to not permitting others to use the fact of having beaten Edison for the purpose of a trade advertisement.

137 X Q. And otherwise important?

Objected to as immaterial.

A. Do you refer to the mere use of a paper?

138 X Q. I refer to the application which related to paper carbons which formed the subject of one of your answers on the cross-examination in behalf of Mr. Swan.

A. I also considered it important that having first used paper carbons that others should not be permitted to use the same to my detriment. Although I have a better material, still a paper-carbon lamp in the hands of unscrupulous persons might be used to my detriment.

139 X Q. Would it not be a great advantage to you and your associates in business to be able by means of a patent for the paper carbon to stop other people from using it even though you did not wish to use it yourself?

Objected to as immaterial.

A. I have patents which would prevent them from using paper carbon even if they had a right to do so. Therefore, this question is rather a broad one.

140 X Q Do you know whether your record books contain all your important experiments in relation to the paper carbon for electric light?

A. No, sir; I do not.

141 X Q. Have you reason to suppose that the books are not full in this respect?

A. Yes, sir; they are not full; they were very poorly kept, and some of the books even have been lost.

142 X Q. You regarded the paper carbon as an important thing at the time you were experimenting with it in 1878, 1879 and 1880, did you not?

A. I regarded the use of the filament of carbon in 1878 and 1880 as a very important invention, but regarded the particular 2585 material of smaller importance to the broad patent for a filament of carbon for an incandescent conductor.

143 X Q. What do you mean by "filament" of carbon?

A. I want a copy of Webster's Dictionary to aid me in a proper definition of the question.

Counsel for Maxim says that he is not asking the witness what the proper definition of the term filament is, or what Webster's definition of the term is, but is asking the witness for his definition of the term as used in his last answer.

Question withdrawn.

144 X Q. Are you able to give a definition of the term "filament" as you used it in your last answer?

A. I could give a definition of a filament of carbon but, as my impression is that this definition will be used in future cases, I desire the aid of a dictionary that I might more fully define it.

145 X Q. What is your own idea in regard to the meaning of that term as you used it in the last answer but one.

A. A thin flexible piece of carbon like a hair, which may be bent, in contradistinction to a stick of carbon.

146 X Q. I find among the questions and answers in the cross-examination conducted by counsel for Swan, the following: "Q. You find a good many remarks that are the contrary to commendatory of carbon filaments in this book (Edison Note Book 52) prior to page 135, do you not? A. No, sir; I do not find one. I find that we had difficulties in carbonizing them. We were very fresh in the business and they were more difficult to manipulate than those cut out of paper, because with those cut flat it was very much easier to get the proper pressure on them, &c." What do you mean by that answer to that question?

A. I mean what I stated.

146½ X Q. In other words you meant, did you, that it was much easier to manipulate flat carbon blanks cut out of paper than to manipulate carbon filaments?

2586 A. No, sir; I do not mean that. I mean that it was much easier to manipulate carbon filaments cut out flat from paper than carbon filaments cut straight from paper and bent in the form of a loop.

147 X Q. Is that what you said?

A. Yes, that is what is meant and said.

148 X Q. Please examine that portion of Note Book No. 52 which precedes page 135, and state whether you find described in that portion carbons made otherwise than from paper?

Objected to as incompetent and immaterial.

A. Yes, sir; I find that it has been made of various substances as is shown on page 117, a photograph of which is in evidence.

149 X Q. Does not the earlier portion of this book (prior to page 135) contain various sketches of carbon filaments in spiral form, and otherwise made of other material than paper?

A. Yes; it shows them made out of thread, and thread with tar rubbed on.

150 X Q. You have stated heretofore how vulcanized fibre is made. What personal knowledge have you of the mode of making this article?

A. I believe I have read the patent containing a description of the process for making vulcanized fibre from parchmentized paper by means of a strong solution of zinc. I have made parchmentized paper myself by this means.

151 X Q. The vulcanized fibre which you used in 1879 for electric light carbons was procured from the Vulcanized Fibre Company, Wilmington, Delaware, was it not?

A. It was made at Wilmington, Delaware, I believe.

152 X Q. Did you procure it direct from the manufacturer?

A. I think we did. We used a great deal of vulcanized fibre for insulating work.

153 X Q. In what shape did you buy that material at that time?

2587 A. We shaved off thin pieces and cut them straight, and bent them in the form of a loop, and carbonized them while so bent.

154 X Q. You mean that you shaved off pieces from slabs of fibre?

A. Yes, sir.

155 X Q. Those slabs were about how thick?

A. I cannot remember the thickness of the particular slab, but we had slabs from a sixteenth of an inch to three-quarters of an inch thick.

156 X Q. Could you produce at the present time any specimen of that vulcanized fibre?

A. It is sold in open market now and can be procured by any one.

157 X Q. Personally, you do not know that the vulcanized fibre which you bought and used in 1879, was made under the patent to which you have referred, do you?

A. No, sir; but I know that we made an analysis of some samples at the time and found zinc in it.

158 X Q. Can you produce the memorandum of that analysis?

A. I could not tell without looking.

159 X Q. Who made the analysis?

A. I cannot remember.

160 X Q. At what date was it made?

A. I think about November, 1879.

161 X Q. Can you state more accurately than that?

A. No, sir. I know that we found it had a great deal of ash, and we had a curiosity to know what were the impurities in it, and some one about the laboratory made a test and found it heavily loaded with oxide of iron and zinc.

162 X Q. In your Note Book No. 52, under date of November 27th, there appears a record of some forty or fifty tests for ash on various kinds of materials. Can you state whether any of those tests related to vulcanized fibre?

A. No, sir; I am sure the test on vulcanized fibre was made previous to that test.

2588 163 X Q. Ought not that test to have been recorded in this book?

A. No, I do not think so. Isolated experiments were not always put down in the book.

164 X Q. Are you sure that that was an isolated experiment?

A. Yes, I feel convinced of it.

165 X Q. How so?

A. I think I made it myself. I burned some of the vulcanized fibre, and then found it had a very large amount of ash.

166 X Q. What refreshes your recollection so that now you can state that you made the test, when a few minutes ago you were unable to state who made it?

A. Because you have called my attention more particularly to that fact, and I have now, since being examined, had called to my memory the fact. I have a pretty vivid recollection of that now.

167 X Q. How can you determine that it was before November 27th, and not after?

A. Because I can remember that we made a vulcanized fibre lamp just a day, I think, after we made a thread lamp, and I remember the circumstances of making the lamp and testing the same, and about the same time we decided to procure all kinds of materials and make lamps of them. And I believe we did procure all kinds of paper, and having an idea that ash was a detriment, that is to say, an adulteration, we made a test, a regular test, to determine which kind of paper had more or less of these adulterations.

168 X Q. When did you make that thread lamp that you have just spoken of?

A. The one that I refer to I think was made on the 20th or 21st day of October, 1879.

169 X Q. You made a great many thread lamps, did you not, along about that time?

A. Yes, sir.

170 X Q. How do you single out that particular lamp as
2589 the one which was directly connected with the vulcanized
fibre?

A. I single it out because the lamp had no tar on it. It was purely made of thread.

171 X Q. How do you connect in your mind the vulcanized-fibre lamp with the lamp made of thread without tar?

A. For the reason that the next lamp made I am quite certain was the vulcanized-fibre lamp after the lamp made of thread without tar.

172 X Q. Was there anything in that lamp made of thread without tar that led you to think of vulcanized fibre?

A. Yes, sir.

173 X Q. What suggested vulcanized fibre?

A. There were spots formed by arcs between the fibres of the thread, which, although I am not sure, I think caused me to get out a more solid filament, and vulcanized fibre being more solid than thread I made a lamp of this, but it being so heavily loaded with zinc it did not give the results I desired.

174 X Q. Can you produce any record showing an experiment made by you of a carbon of vulcanized fibre introduced into an exhausted glass receiver so as to form an incandescent lamp?

A. Yes, sir. On page 117 it states that we had carbonized vulcanized fibre with other things, and on page 169 lamps were made from vulcanized fibre, Nos. 79, 80, 81, 82 and 83.

175 X Q. What is the entry on page 169 to which you referred in your last answer?

A. "79 and 80 made from Crane's parchment No. 56. 81, 82 and 83 made from Crane's parchment No. 44."

176 X Q. You understand then, do you, that this entry is an entry relating to vulcanized fibre?

2590 A. Yes, sir. Parchmentized paper is vulcanized paper. The particular process for parchmentizing the paper used at Wilmington has been called vulcanizing. Parchmentization and vulcanization are the same, both being done by chemical agents which act in the same manner upon cullulose. When I speak of vulcanized fibre in one sense I mean that procured at Wilmington. When I say that Crane's parchment is vulcanized fibre I mean that it is a product the same as that at Wilmington and can be with truth called parchmentized or vulcanized fibre.

117 X Q. What does your Note Book 52 mean when it uses the term vulcanized fibre?

A. It means parchmentized paper made at Wilmington and called vulcanized fibre.

178 X Q. Can you produce from your Note Book No. 52 or any other note book a record of any experiments made with an incandescent lamp having a carbon of vulcanized fibre in the last sense of the term?

A. You mean vulcanized fibre made at Wilmington?

179 X Q. Yes. That is, I mean vulcanized fibre in the sense in which you used the term on page 117 of your Note Book No. 52, which I understand you to say means the material made at Wilmington?

A. I do not find in the note book any record of a lamp being made containing vulcanized fibre made at Wilmington but only the same kind of material called Crane's parchment in lamps 79 and 80 and the others on page 169.

The last part of the answer objected to as uncalled for by the question and volunteered.

180 X Q. Have you any record of the experiments made with the lamps containing carbons constructed from Crane's parchment paper?

A. I desire to amend the previous answer by stating that I have looked over the book and find that on page 107 we made a lamp of vulcanized fibre.

2591 181 X Q. Now produce, if you can, your record of the experiment or test which you made with that lamp?

A. This book appears to be a record of lamps made, and another book, which is in evidence, of the results of the experiments in working the lamps. My counsel states that no record of the results obtained from the vulcanized-fibre lamp mentioned on page 107 is contained in the book.

182 X Q. So far as you know, do your record books contain an

account of any test made of a vulcanized-fibre lamp, meaning by that material such as you procured from Wilmington and subsequently vulcanized?

A. No, sir; I do not know.

183 X Q. What record do you find in your note books in regard to experiments or tests with lamps containing carbons made from Crane's parchment paper?

A. I find a record of lamps 79, 81 and 82, of which photographs are in evidence.

184 X Q. Will you explain the entry in relation to lamp 79, of which entry Edison's Exhibit N is a copy?

A. It seems that the filament of carbon before the current was passed through it, and while the globe was exhausted of air, measured 350 ohms. After the current had passed through the filament, it was found to have a resistance of 138 ohms. After burning for some time, it was reduced to 135 ohms. When sealed off of the pump, it measured 142 ohms. It means that it had a good vacuum—that is to say, the globe was in high vacuum.

185 X Q. Does it anywhere appear that any tests were made with that lamp after it was sealed off from the exhausting pump?

A. It is not in these two books; but I distinctly remember that these lamps, when they came off the pumps, were put up to the proper candle power and burned to be able to get their lasting time. That was our practice.

186 X Q. Does not your records give an account of the lasting time of some of your lamps?

2592 A. Possibly they do in some other book.

187 X Q. But, so far as you know, there is no record of the durability of this particular lamp 79?

A. I have not looked over the records. Possibly if I looked over them, I could find a record.

188 X Q. According to the entry in your record book in regard to lamp No. 81, of which entry the photograph Edison's Exhibit O is a copy, how high was the carbon heated measured by the color of the light?

A. From the record I should judge that the carbon was bright red, and while bright red a measurement of its resistance was taken, which is recorded as being of 320 ohms. It does not state what its resistance would be at any other incandescence.

189 X Q. Have you any record in regard to the tests made with lamp 80?

A. Yes, sir.

190 X Q. What is that?

A. I find, on page 238 of my book, the following record of lamp 80: "When cold before heating it was 1,100 ohms; after heating a moment it was reduced to 340; when I put the current suddenly it bursted at one of the ends."

191 X Q. Do you know how Crane makes the paper which is sold as Crane's parchment paper?

A. Not to my knowledge.

192 X Q. On page 15 of the twelfth bulletin of the Edison Elec-

tric Light Company, is contained the following: "The third point in Swan's first patent, and the first point of his second patent, is parchmentization prior to carbonization; Edison tested this as early as 1878, and he soon after mentioned it in a caveat, but he found no gain in this additional step of parchmentization; besides, it costs money and increases the cost of production of the finished lamp." What, if you know, is meant in that extract by the statement that Edison found no gain in this additional step parchmentization?

Objected to as incompetent and immaterial.

2593 A. That is an opinion of Major Wilber, counsel for the electric light company.

193 X Q. It professes to be the opinion of the Edison Electric Light Company, does it not?

A. I do not know; I understand it is the opinion of Major Wilber, given to the Edison Electric Light Company.

194 X Q. Did not the Edison Electric Light Company adopt that opinion before embodying it in this circular?

A. I do not know.

195 X Q. The bulletin was issued by the company and not by Major Wilber?

A. Yes, sir.

196 X Q. And does not profess to give the views of Major Wilber, but those of the company?

A. I do not know; the document itself is the best evidence what it purports to do or not.

198 X Q. What officer of the company prepares those bulletins?

A. That bulletin, I believe, was prepared by the vice-president.

199 X Q. You mean by Major Eaton?

A. Yes, sir.

200 X Q. How do you know it was prepared by Major Eaton?

A. Only from the fact that he prepares the bulletins; they all emanate from him.

201 X Q. Does he ever advise with you about the contents of them?

A. Sometimes he does.

202 X Q. You remember how it was with reference to this bulletin number twelve?

A. No, sir; I do not.

203 X Q. Is it true, in point of fact, that you have not gained anything by this additional step of parchmentization or is this a misstatement which the Edison Electric Light Company have sent out to its stockholders? 2594

A. As a matter of fact, I have obtained better results from the use of bamboo than from the use of parchmentized paper.

Objected to as not responsive, and question repeated.

A. As I have stated that bamboo gave me better results than parchmentized paper, and I think that is an answer.

204 X Q. That paragraph of the bulletin, now under discussion, assumes to compare Swan's carbons when made from paper which

was parchmentized prior to carbonization with carbons made from paper which was not parchmentized prior to carbonization, and the statement is that Mr. Edison found no gain in this additional step of parchmentization; meaning, of course, that he found that parchmentization was of no value in the preparation of carbons from paper. Please state whether, in point of fact, that is true, or is this declaration contained in the bulletin of the electric light company a misstatement?

Question is objected to by counsel for Edison as incompetent and immaterial, and as containing a statement of what can best be determined by reference to the paper itself.

A. It is true that there does not appear to be any advantage gained over unparchmentized paper by parchmentized paper.

205 X Q. Do your experiments with the two classes of paper demonstrate that?

A. It demonstrates that no apparent gain is obtained by parchmentizing the paper. But I believe there may be a gain if perfectly parchmentized material could be obtained.

2595 206 X Q. Does this appear from the record which you have made in your note books of your various experiments with the two kinds of paper carbons?

A. No, sir. We used all kinds of papers, both parchmentized and otherwise, and as the records show several were made with parchmentized paper, and had they been as good as the ones made with other forms of paper, we should undoubtedly have continued to use parchment paper in place of those other kinds of paper. Whether the material used was properly parchmentized or not might have been the reason why it did not give as good results as other forms of paper.

207 X Q. You parchmentized some of it yourself, did you not?

A. I tried to parchmentize some.

208 X Q. Did you fail or succeed in that attempt?

A. I parchmentized, but not so successfully as that which I purchased.

209 X Q. Have you seen this Exhibit H?

A. Yes, sir.

210 X Q. Did you parchmentize that?

A. No, sir.

211 X Q. Who did, if you know?

A. That would be hard to say who parchmentized that particular piece of paper, after a lapse of two or three years.

212 X Q. Is it some of Crane's paper?

A. My impression is that it is.

213 X Q. During the last of 1879, and the first of 1880, how many note books were in use in your laboratory at any one time?

A. I cannot say. There were a pile of them laying round the laboratory.

214 X Q. Was it your practice to leave blank places in your note books to be subsequently filled up either by yourself or your assistants at your leisure?

A. No, sir. We picked up the book and turned to the first blank page and entered what was desired on the page and dated it.

2596 215 X Q. Does the date show the date on which the entry was made or the date on which the experiment which is recorded was made?

A. Yes, sir.

216 X Q. Which one?

A. It was always our practice to put the date down on which the entry was made.

217 X Q. Did you never owing to pressure of business or otherwise omit to make an entry on a day when some experiment was performed, but leave blanks which you could subsequently fill up under that date?

A. No, sir; I do not think so. I think the books themselves will show the way the records were made.

218 X Q. How do the books show?

A. By the dates.

219 X Q. But if you were to leave blank pages and fill them up subsequently in consecutive order it would do, would it not?

A. We never followed that practice. Where a large number of experiments follow after each other the date is on the first page generally and no dates are on the other pages.

220 X Q. And that always means, does it not, that the record was made on the date which is given and has no necessary relation to the time when the experiments were made?

A. It means that where the date is put the entry was made on that date, but where no date was put it does not follow that the entry was made on the date of the first part of the experiment. Wherever there is a date it means that all of the records under that date on that page were made at the time on that day.

221 X Q. What does it show as to the date at which the experiment was made, before the thing was constructed, which is described in the entry?

A. It means that the experiment or thing was made on that date or finished on that date generally.

2597 221 X Q. Was the testimony which you gave in the interference between yourself on the one hand and Sawyer and Man on the other, a copy of which deposition is in evidence in this case, true?

Recess here taken for an hour.

A. The evidence which I gave in the Sawyer-Man interference with myself was true.

222 X Q. How many paper carbons for electric lamps, roughly stated, have you ever made or caused to be made?

A. Several thousand.

223 X Q. How many such have you ever sold or has the Edison Company sold?

A. I cannot state. I do not keep their books.

224 X Q. Of the several thousand paper carbons made, how many were made of parchmentized paper?

A. There might have been a dozen or so made in 1879 and I think as many as 100 in the latter part of 1880.

225 X Q. How many of these carbons made from parchmentized paper were sold?

A. I do not know. The lamp factory keep the accounts and they probably know how many lamps of these kinds of lamps were sent out with others.

226 X Q. Do you know that any of them were sold?

A. No, sir; I do not. We were making a large number of lamps, and whether these were mixed in with the others or not, I cannot tell.

227 X Q. Of the several thousand lamps with paper carbons, how many had carbons that were straight in the blank and then bent in the loop form before carbonization?

A. I did not state that there were several thousand lamps made. I said in answer to your question that there were several thousand carbons. Of the number of lamps made I think 75 to 100 and perhaps more were made from straight strips or filaments cut straight and bent in the form of a loop, and carbonized while so bent.

228 X Q. How many of these were sold?

A. I do not know.

2598 229 X Q. Do you know that any were?

A. I cannot tell whether they were mixed with the regular lot or not.

230 X Q. What do you mean by the regular lot?

A. We were making a large number of lamps every day from bamboo. These were the regular lamps.

231 X Q. Between what dates were these 75 or 100 lamps made? I mean lamps containing paper carbons that were cut straight and then bent before carbonization.

A. It was either in December, 1880, or in January, 1881, that the lot I spoke of were made.

232 X Q. How many lamps having paper carbons of all kinds have you ever made or caused to be made?

A. I cannot at this date tell how many, but I should judge that we made as many as 1,500, possibly 2,000.

233 X Q. When were those made mostly?

A. In the latter part of 1879 and the early part of 1880. Also I think a number were made in the early part of 1881.

234 X Q. Which did you find to be the best lamp, the one in which the paper carbon was cut out in horseshoe form or the one in which the paper was cut out straight and then bent in horseshoe form before carbonization?

A. It was not a question of the particular form of the paper. It was a question of the facility of manufacturing and carbonizing the paper in the different forms. It was a very difficult matter to cut the paper straight and then properly carbonize it when we first started, and the reason why we changed over to the other form was because it was easier to make them and carbonize them in this form.

235 X Q. And cheaper?

A. At that time it was not a question of cheapness.

235 X Q. Which is the cheaper, in fact?

A. Punching the blanks would be cheaper than cutting them out straight. But it is difficult to punch a long filament—that is to say, it is more difficult, I understand, than if in the horseshoe form.

2599 236 X Q. Which method of manufacturing gave you the better product, cutting straight and then bending and carbonizing, or cutting in loop or horseshoe form and carbonizing?

A. Owing to the difficulty of cutting in straight form, we only made a few lamps at first and adopted the other form. Therefore the comparisons at that time could not be made that would be correct. Besides, we did not know as much when we cut them straight as we did a few days afterwards, when we cut them the other way, and lamps made at one time would not be so good as they would be several days afterwards. But since that, while not the cheapest, the best way and most accurate method of cutting is in the straight form. It is the form we adopt in cutting out bamboo. But the mechanism is one of exceeding difficulty to make, even now, a single cutting mold costing from $100 to $250.

237 X Q. Is the reason for cutting the bamboo straight different from that which would lead you to cut the paper straight?

A. We could not cut the bamboo in the form of a horseshoe at all. We could have cut the parchmentized paper or vulcanized fibre in 1880 by punching in horseshoe form, but we preferred to cut it straight.

238 X Q. Why?

A. Because you can do it more accurately.

239 X Q. You found great difficulty in manipulating the blank after it was cut, did you not?

A. No, sir, because we had worked up to perfect means and methods, whereby it could be properly carbonized and brought out straight. It was only in the early days that we had the difficulty.

240 X Q. Which would be the most expensive process of preparing paper carbons to-day, to cut the blank in the loop form and carbonize it, or to cut it straight and then bend it and carbonize?

A. Cutting it straight would be the cheapest, although
2600 it might be punched in the form of a horseshoe, but punching is not the best way.

241 X Q. When I said cutting I meant to use the term in a sense broad enough to include punching as one form of cutting.

A. Both kinds might be punched. Then they would be equally as cheap.

252 X Q. Would there not be a special manipulation in the one case that would not be necessary in the other, and would not that add to the expense?

A. Both could be punched by punch and die. The punching straight might be more difficult than punching in the form of a horseshoe, by reason of the great length of the die, although when the die was made I could have punched with equal cheapness.

253 X Q. After you had punched out the blank you would have to use special appliances for bending and confining the blank in

form before carbonizing in the one case, that would not be necessary in the other, would you not?

A. Yes, sir.

254 X Q. Would that add anything to the expense?

A. Yes, sir.

255 X Q. Would it make that process more expensive than the other?

A. Yes, sir.

256 X Q. Then in reality it would cost more to make a paper carbon for an incandescent lamp by the process of cutting straight, then bending and carbonizing, than by the process of cutting or punching in loop form and carbonizing? Is that correct?

A. As far as the carbon itself is concerned it would, but as far as the manufacturing of lamps is concerned it would not, because the paper carbon cut straight is a better carbon than when punched in the horseshoe form, and less lamps would be lost in the process of manufacture. Hence the straight-cut carbon lamp would be less expensive, although the carbon filament itself might cost more.

2601 257 X Q. You mean to say, do you, that carbons prepared from the blank, cut straight and then bent, will be more durable than the other form of carbon?

A. I mean to say if it is cut straight.

258 X Q. You mean cut rather than punched?

A. Yes, sir.

259 X Q. Please compare two paper carbons which are made by punching out the blanks in the one case straight to be subsequently bent and carbonized and in the other case in horseshoe form, and tell me first, which of those would cost the most, and in the second place, which would be the best?

A. I should say the filaments in both cases could be made with equal cheapness. In carbonizing, the straight filament would probably cost the most. As to their quality, it would depend upon how both were carbonized.

260 X Q. When I asked you for the relative cost, I meant the cost of the carbon as finished and ready to be used in a lamp. Which one would cost the most?

A. If both were punched, I think the straight carbon would cost the most.

261 X Q. And which one would be the best?

A. I think the straight carbon would be the best.

262 X Q. Why?

A. Because the application of the strain and pressure to get them all alike can be better applied than if they were punched out in the horseshoe form.

263 X Q. What do you mean by the strain and pressure to get them all alike?

A. If filaments are carbonized without anything to retain them in shape or restrain them, they will curl in all kinds of shapes.

264 X Q. In carbonizing a blank horseshoe form would you not

adopt some means to prevent its curling and warping in every direction?

A. Yes, sir.

2602 265 X Q. Could not this be done as well with a blank cut in horseshoe form, as a blank cut straight and thent bent?

A. It possibly could be done.

266 X Q. If you were going to make a thousand incandescent lamps with paper carbons for exhibition to-day, would you prepare the carbons by making them in horseshoe form, or would you make them straight and then bend them?

A. I would make them straight and bend them.

267 X Q. Why?

A. First place, filaments cut and not punched are better, and it is easier to cut a filament straight than it is to cut it in the form of a horseshoe; and second, because we have means which experience has given us for restraining the carbon so as to prevent its warping, and producing them all of the same length.

268 X Q. You mean restraining a paper blank during process of carbonization?

A. Yes, sir.

269 X Q. When did you discover those means of thus restraining the paper blank when cut straight?

A. If you mean strips cut straight and carbonized straight, I discovered it in 1876.

270 X Q. No, I mean cutting straight then bending, and then carbonizing?

A. Some time in September or October, 1879.

271 X Q. Then you knew, did you, in September or *or* October, 1879, that you could make a better carbon out of paper by cutting the blank straight, and then bending it in a loop form and carbonizing?

A. No, sir; I did not.

272 X Q. When did you get this knowledge first?

A. I had no knowledge as between one or the other methods at that time. I simply adopted the horseshoe form on account of the case as against the other process at that time of making it.

2603 273 X Q. When did you first learn that it was easier to cut the blanks straight and bend them before carbonizing?

A. That is self-evident that it is easier to cut a straight blank than it is to cut a carbon blank like a horseshoe.

274 X Q. I will put the question in this form: When did you first discover that it was easier to make electric carbons out of paper by cutting the blanks out straight and then bending and carbonizing, rather than by cutting in loop form and carbonizing? You will please remember that this question includes the whole process of making the carbons, and not simply the first step of cutting out the blank.

A. We knew at the time that it was easier to cut these carbons straight than it was to cut them round a grooved form. But the straight carbon filaments presented difficulties in carbonizing. The others in horseshoe form did not present these difficulties in carbonizing. We were in a hurry to get some lamps and could not wait to work up all the details necessary to successfully carbonize as we wanted straight filaments.

275 X Q. Have you discovered since 1879 that it is easier, everything considered, to make paper carbons by cutting the blank out straight and then bending and carbonizing, than it is to cut the blanks out in loop form and carbonize them?

A. Yes, sir; besides, that is self-evident. When I say self-evident, I refer in all cases to carbons cut by a knife in contradistinction to carbons punched.

276 X Q. Which makes the best carbon, one produced from a blank which has been cut out of a sheet of paper with a knife, or one made from a blank cut from a sheet of paper with a punch?

A. The one cut by a knife, as a sharper and cleaner cut can be made, and it does not leave a burr or ragged edge.

277 X Q. When did you first discover that a paper carbon
2604 produced by making a blank straight, then bending and
carbonizing it was better than a paper carbon produced by
making the blank in a loop form and carbonizing it?

A. Do you mean both being cut by the knife?

278 X Q. Both being shaped by the same class of cutting instrument whether knife or punch?

A. If you will state whether by knife or punch, I will answer the question.

279 X Q. You may answer the question assuming it relates to the use of a punch.

A. I cannot give you the date of any discovery, but I can state that if both the horseshoe and the straight carbon were punched and then carbonized, and then put in a lamp, I think the lamps made with a straight carbon would be better lamps for the reason, as I have already stated, that the strains on the carbon can be better placed, and the carbons brought out more alike than in the case where they are punched out, laid in moulds one above the other with one weight common to all.

280 X Q. The same reason would apply if the blanks were formed by cutting with a knife?

A. Yes, sir, except that where the horseshoe is punched the burr or edge thrown up somewhat interferes with their proper application of the weight and their contraction as against the same kind of a loop having no burr but the weight applied equally over the whole surface of the filament.

282 X Q. How many paper carbons have you ever made where you cut out the blank in horseshoe form, using a knife for that purpose?

A. Several thousand.

283 X Q. Have most of your blanks been cut with a knife rather than a punch?

A. The horseshoes have.

284 X Q. How about the paper carbons where the blanks were made straight and subsequently bent? Were those cut out with knife or punch jointly?

A. They were cut out with a knife.

2605 285 X Q. Never with a punch?

A. No, sir; I do not remember of any.

286 X Q. If I understand you right, you have testified that you have made or caused to be made at least 1,500 or 2,000 incandescent lamps with paper carbons. Is that correct?

A. Yes, sir.

287 X Q. And of this number, if I understand you aright, some 75 or 100, more or less, had carbons which were made by cutting the blank straight and then bending and subsequently carbonizing it. Is that correct?

A. I think I have made as many as 150 lamps in the latter manner.

288 X Q. Most of these 150 lamps last referred to were made, if I understand you, in the latter part of 1880, or early in 1881. Is that correct?

A. Yes, sir.

289 X Q. And at that time you knew, did you not, that it was easier to make the carbons in that way, namely, by cutting the blank out straight and then bending and carbonizing it, than by making it in horseshoe form and carbonizing it? And you also knew, did you not, that it would make a better carbon by cutting the blank out straight, then bending and carbonizing, than to make it in horseshoe form and carbonize it?

A. I knew at that time that it would be cheaper to cut it out straight than it would be to cut it out by a knife in a grooved form like a horseshoe. And I also knew that with my approved appliances it would be a better carbon.

290 X Q. And yet you adopted for your lamps generally a more expensive mode of manufacturing the carbon and a mode which gave you an inferior product. Is that correct?

A. No, sir; I have stated the opposite.

291 X Q. Which of the two modes of making these carbons do you now say gave you the best product?

2606 A. The best way would be to cut them straight, bend them in the form of a horseshoe or loop, and carbonize them.

292 X Q. That is because it gives you the best product?

A. Yes, sir.

293 X Q. And it would be the easiest way?

A. With my present appliances it would be the easiest way.

294 X Q. And you knew in 1879 that it was the easiest way, did you not?

A. I knew in 1879 that it was the easiest way to cut, but not the easiest way to carbonize them.

295 X Q. When did you learn that it was the easiest way to carbonize them?

A. I knew at the time, by working up the details, it would be as easy to carbonize them, although it might be more expensive on account of the molds and things necessary.

296 X Q. Is it not a fact demonstrated by the entries in your various note books, that the paper carbons which you have made

from the blanks cut out in horseshoe form, have behaved better in lamps than those which you made by cutting the blanks out straight and then bending and carbonizing them?

A. They behave better for the reason that I have already stated about ten times, that the trouble was in carbonizing those cut straight and as I had not time to go ahead and experiment on devices whereby I could eliminate this defect in carbonization I adopted the more ready plan of cutting them out in horseshoe form for the ease with which they could be carbonized.

297 X Q. What experiments have you made since 1879 which justify you in saying that a carbon made from cutting a paper blank out straight and then bending and carbonizing is superior to those made by cutting the blank out in horseshoe form and then carbonizing?

Objected to as incompetent and immaterial.

2607 A. I remember that when in the early part of 1880 we got a straight cutting mold, and had worked up devices whereby straight carbons could be carbonized in a proper manner, that the lamps made with these straight carbons bent in the form of a loop and carbonized gave better results and lasted longer than the ones previously made by cutting it in horseshoe form.

298 X Q. Will you please produce your records of the experiments to which you have made reference in your last answer?

The question is objected to as incompetent and immaterial, and the witness is instructed that he need not produce records of inventions not bearing upon this controversy which have not already been patented.

A. I suppose I could find records if I should look through my books. They are not here.

299 X Q. Where are the books to which you refer?

A. I think some are at my house; perhaps some of them are in the possession of the electric light company.

300 X Q. That is in this building, is it not?

A. Yes, sir.

301 X Q. Do you know if there are any records in your note books that would bear out your statement as to those experiments made early in 1880?

A. I do not know, but I think there might be. As I cannot tell what any examination will lead to, I cannot tell what matter to introduce beforehand.

302 X Q. Will you, before the close of the testimony in this interference, produce such records as you may have of those experiments made in the year 1880 which lead you, as you state, to the conclusion that a paper carbon made by cutting the blanks straight and then bending and carbonizing was better than one made by cutting the blank in horseshoe form and carbonizing?

A. If my counsel will permit me I will look over the records, and if I find anything bearing on that subject, if they will permit, I will introduce it.

2608 303 X Q. If we hear nothing from you in that regard, may we conclude that you have found nothing?

A. No, sir.

304 X Q. Would not that be a logical conclusion; you agree to produce the records if you find them; now would it not be fair to assume that if we do not hear from you, you have not found any such record?

A. If my counsel instructs me that I need not produce anything, I shall certainly not take the time to go over a vast amount of records to find the matter in question, as it is not an easy job.

Counsel for Maxim states that inasmuch as the witness has testified in substance that probably such records exist, it will be assumed that inasmuch as the witness has said that if he should find records to that effect he will produce them, it will be assumed at the hearing of this interference, if such records have not been introduced that they do not exist.

Counsel for Edison replies that counsel for Maxim has misstated the substance of the witness's testimony, in this that the witness really stated that he would examine his records and produce them if permitted to do so by counsel. Therefore his inability to do so does not in any sense imply that such records do not exist. Counsel for Edison further states that inasmuch as the records of experiments called for bear simply upon the witness's judgment as to the comparative cheapness and utility of the two classes of carbons, they are immaterial upon the issues of this controversy, and the witness will be instructed not to produce them.

305 X Q. How many lamps with paper carbons did you make, or cause to be made, during the year 1881; state approximately if you can?

A. I have already stated that I think 75 or 100 lamps having paper carbons were made either in December, 1880, or January, 1881. I do not now remember any other in 1881.

306 X Q. Why did you make those at that time?

2609 A. Because I wanted to make a comparison between the life of the lamp made with bamboo and with paper, vulcanized fibre or parchment paper.

307 X Q. How many lamps with carbon paper did you make in 1882? State approximately.

A. I did not make any myself; whether any were made at the lamp factory I cannot state.

308 X Q. Then almost all the lamps with paper carbons which you have made were made in 1880, were they?

A. In 1879 and 1880.

309 X Q. You have testified about certain lamps having paper carbons made in 1877; will you state more explicitly what those were?

A. Have I so testified in this interference?

Question withdrawn.

310 X Q. Did you make any lamps having paper carbons in 1877?

A. Yes, sir.

311 X Q. How many?

A. One lamp that I now remember of.

312 X Q. How many carbons did you try in that lamp?

A. Several.

313 X Q. How were those carbons made?

A. Made by carbonizing paper.

314 X Q. Explain fully the process of making them as to shape, manipulation and other details.

A. It is a long while ago and I have not refreshed my memory on the subject, but I will try and remember as near as possible. Strips of paper were cut out and placed in an iron mold with a weight on top of the paper strips, and put into a stove and carbonized. The strip was then taken out, put into a lamp, and clamped, the base of the lamp put over a hand pump, the air exhausted as far as possible and the current passed through the carbon.
2610 An experiment on the pump under the bell glass, was made with a loop of carbon carbonized in charcoal by means of heat from paper. The carbon being mounted in clamps and the bell jar put over the whole, the air exhausted from the bell jar and the loop heated by the passage of a current. Also straight strips of carbon were put in between clamps, and bowed out initially so that any contraction would not break the carbon.

315 X Q. Is that all you recollect about those experiments?

A. It is, sir, at the present moment. I should have to refresh my memory.

316 X Q. How would you do that? By any memorandum that you have?

A. Yes, sir.

317 X Q. Have you a memorandum of those experiments?

A. I think I have.

318 X Q. Where is that?

A. I do not know where they are now. Perhaps in the building.

318½ X Q. When was the memorandum made?

A. I cannot remember.

319 X Q. Made at the time of the experiments?

A. I cannot remember.

320 X Q. But you are confident you have such a memorandum?

A. I think I have.

321 X Q. In what shape is it? In one of your regular memorandum books?

A. No, sir; I think not.

322 X Q. In what shape is it?

A. On a piece of paper.

323 X Q. It is probable that you made it at the time of the experiment, is it not?

A. Yes, sir; it is probable.

324 X Q. Yet you would not swear to it?

A. No, sir; I have not refreshed my memory on it at
2611 all. It is so long ago and so many things have passed
through my mind since.

325 X Q. How lately have you seen that memorandum?

A. I do not think I have looked at anything relating to that subject for over a year. I am sure I have not.

326 X Q. Do you think you saw that memorandum a year ago, or at any time within two years?

A. I cannot remember.

327 X Q. Who assisted you, if anybody, in making those experiments in 1877?

A. I think Charles Batchelor and James Adams.

328 X Q. Anybody else?

A. Perhaps John Kreusi; I am not certain.

329 X Q. What kind of paper was used in making carbons used in those experiments?

A. I cannot remember without refreshing my memory.

330 X Q. Did you not use parchment paper then?

A. Very possibly.

331 X Q. Why do you say very possibly?

A. Because my laboratory is well stocked with every kind of material.

332 X Q. Was it at that time?

A. I think we had a pretty good supply of different materials.

333 X Q. Do you think you did use parchment paper?

A. I cannot tell without refreshing my memory.

334 X Q. Did you not testify in the interference case between yourself and Sawyer-Man referred to in your present deposition that you thought those carbons with which you experimented in 1877 were made of bristol-board?

A. I do not remember. I have not read my evidence in the Sawyer-Man case since it was taken.

335 X Q. If you did so testify in that case, is it probable that those carbons you made were of bristol-board?

A. If at the latter end of my testimony in that case,
2612 after having my memory refreshed by being some time on
the stand, I did not state that I used parchment, it is probable that we did not use parchment paper.

336 X Q. Do you now say that you think you used parchment paper in 1877 or bristol-board?

A. I said that we might have used it.

337 X Q. But you have no present recollection as to what in fact you did use?

A. Not without refreshing my memory.

338 X Q. Had you refreshed your memory upon this point when you gave your direct testimony in the present interference?

A. No, sir; I do not cram for a case. I have not time.

339 X Q. Have you not testified in the present interference that you did use parchment paper in those experiments in 1877?

A. I do not remember of having so testified. I remember, I think, of testifying in the Sawyer-Man case that I used parchment paper, but I think this referred to 1879. In the present interference I may have testified that we used parchment paper, but I do not remember it now. Since testifying I paid no attention to the matter whatever.

340 X Q. Can you now remember about how many paper carbons you experimented with in 1877?

A. There might have been six or eight—possibly twelve.

341 X Q. And some of them were in loop form, were they not?

A. Yes, sir.

342 X Q. Do you recollect what you testified in the Sawyer-Man interference as to the shape of those carbons?

A. No, sir.

343 X Q. Did you not testify that they were straight?

A. Some were straight. As a matter of fact they were not exactly staight, as they had to have an initial bowing to prevent them
2613 being broken or contracted after the current had been put
on. I do not think the question in interference with Sawyer-Man related to what particular shape the carbons were in.

344 X Q. How large light did you get from those carbons in 1877?

A. I think they oxidized immediately, and possibly we *we* got three or four candles; very difficult to judge.

345 X Q. Why difficult to judge?

A. Because even now an expert cannot tell whether a gas jet is giving ten or twenty-five candles by looking at it.

346 X Q. He can measure it, can he not?

A. Yes, sir; but we had not reached the photometer at that time.

347 X Q. Then you simply guessed at the candle power of those carbons in 1877?

A. Entirely a guess.

348 X Q. And you estimated about three or four candles?

A. At this present moment I estimate that they might have given two to eight candles; possibly more, possibly less. Very difficult matter to judge it.

349 X Q. Do you think any one of them gave as much as two candles light?

A. It is a very difficult matter to state the candle power. Some of the experiments were tried in the daytime, they did not last long enough to judge much about it.

350 X Q. How long did they last?

A. Well, perhaps a minute or two minutes. Some of them went out almost immediately.

351 X Q. Do you think that any one of them lasted two minutes?

A. Without refreshing my recollection I do not think they did last two minutes, any one of them.

352 X Q. Perhaps not as much as two minutes?

A. Yes, perhaps not as much as two minutes.

353 X Q. Would you be willing to swear that any one of them lasted one minute?

2614 A. No.

354 X Q. Those experiments of 1877 took place in August?

A. July, August or September.

355 X Q. After that, when next did you make any lamps having paper carbons?

A. In the winter of 1878.

356 X Q. How many lamps did you make then?

A. I cannot now remember without refreshing my memory; I think we made a number of carbons out of rolled-up paper. I think we only tried experiments with the carbons.

357 X Q. That is, without putting them into lamps?

A. We made a kind of a contact lamp, in which we used these paper carbons where the light was given out by bad contact between a piece of metal and the carbon.

358 X Q. Have you any record of those experiments made in the winter of 1878?

A. Yes, sir; I think I have. I think they were included in the Sawyer-Man interference.

359 X Q. Do you know how many carbons you made at that time?

A. They were made, I think, by a man named Martin Force; also by Mr. Batchelor; I do not know *know* exactly how many they made; perhaps as many as twenty or thirty.

360 X Q. And perhaps a less number?

A. No, I think they made as many as twenty

361 X Q. Your note books would show?

A. I do not know whether they would show the number; I think I have testified as to the number in the Sawyer-Man interference.

362 X Q. Is it not a fact that your experiments with carbon paper in 1877 made so little impression upon your mind that when you prepared your preliminary statement in the Sawyer-Man interference you omit all mention of those experiments?

2615 A. The main thing that was in my mind was a lamp made of a filament of carbon independent of the particular quality of material or cellulose used, and as the experiments of 1877 as to electric lamps were failures they did not impress me one way or the other; certainly not as to material.

363 X Q. You made no mention of those experiments of 1877 in that preliminary statement?

A. I do not remember whether I did or not; I think I had my attention called to the fact afterwards by other parties.

364 X Q. Did not the Sawyer-Man interference relate to a paper carbon, and was not the question involved there one of priority between yourself and Sawyer and Man as to the alleged invention of the paper carbon?

A. Yes, sir; but at the time the preliminary statement was made I had given the subject very little attention, and my mind was full of the fact that they were endeavoring to deprive me of the use of a filament of carbon, and paper in my mind then was a secondary consideration. When I make a preliminary statement I generally put into it what I remember at the time, without looking up my notes and memoranda, because I seldom have time; but afterwards, in collecting all the data, and talking with other people, I then have my memory refreshed about things which I had forgotten; to remember all the experiments made by me in the last eight*h* years would require a very prodigious memory.

365 X Q. Did you not say in your testimony in the Sawyer-Man interference that in making your preliminary statement in that case you had forgotten about the experiments of 1877 because "the results were probably not sufficiently satisfactory to impress it on your mind"?

A. I probably did say so.

366 X Q. Was that statement then made by you true?

A. Yes, sir.

2616 *8*67 X Q. You say that you had in that year 1877 one lamp in which you used paper carbons; how was that one lamp constructed?

A. We had a lamp spiral removable from the pump, which is called a Gassiot cascade, which could be exhausted by placing it over the mouth of the pump.

368 X Q. Where was this so-called lamp at the time you passed the current through the carbon; was it on the air pump or elsewhere?

A. I think we tried two or three carbons in the lamp. The carbon was lighted while the lamp was on the air pump, it might have been taken off and set on something as it had a cock whereby we could cut off the connection between the globe and the pump, and disconnect the lamp from the same and set it in any position we desired from the pump.

369 X Q. Why did you stop your experiments with paper carbons in 1877, in August or September, and not renew them again till the winter of 1878?

A. Because we had such hard work in getting a vacuum whereby the carbons would remain stable. We renewed them in 1878 because we were going to use the carbon in a condition where it did not require a vacuum. Although I think we also tried them in a vacuum

370 X Q. Did you not testify in the Sawyer-Man interference that the carbons with which you experimented in 1878 in the so-called lamp which you then had were straight?

A. I remember that the carbons were rolled up and therefore were bent, but the whole formed a straight piece of carbon. But the paper itself was bent.

371 X Q. Please explain a little more fully your meaning?

A. The paper was rolled up like a tube and then carbonized. The tube was straight.

372 X Q. Then you do not wish to be understood as saying that these 1877 paper carbons were brought into the loop form?

2617 A. Some of them were loops. The ones which I have testified as straight had a loop in them for the purpose which I have before stated. The others were in the form of a loop and secured to a rigging on the pump over which a bell jar was placed.

373 X Q. When was the carbon brought into the loop form?

A. The ones that were straight, as I have stated, were bent before they were carbonized, while the other ones in the form of a loop were carbonized while in a bent condition in charcoal.

374 X Q. Were those carbons which you say were in loop form made by rolling up a strip of paper and then bending it?

A. No, sir.

375 X Q. How were they made?

A. Small strips of paper bent round in the form of an arch and placed in charcoal and carbonized.

376 X Q. And those were used in the Gassiot cascade?

A. No, sir. They were used on a rigging on the face of an air pump, over which the bell jar was placed.

377 X Q. Will you produce the memorandum of your experiments with paper carbons in 1877. Also the memorandum of your experiments with paper carbons made in 1878?

A. I will try and produce them.

Adjourned until Saturday, May 26th, at 10 a. m.

NEW YORK, *May 26th*, 1883.

Met pursuant to adjournment.

Parties present as before.

THOMAS A. EDISON resumes the stand and cross-examination continued:

2618 By Mr. DUNCAN, counsel for Maxim:

378 X Q. Have you made search for, and can you now produce the memoranda or any of them called for by the last question?

A. No, sir; I have not had time.

379 X Q. Have you made search for, and can you now produce any of the other memoranda or records called for during this cross-examination?

A. I have not made any search for exhibits at all.

Counsel for Maxim calls upon the counsel for Edison to produce for inspection such memoranda as have been called for in the course of the cross-examination of this witness.

Redirect examination by Mr. R. N. DYER, counsel for Edison:

380 R. D. Q. What has been your practice in regard to applying for patents upon modification in details of principles upon which you have been working, that you have successfully and practically used?

A. I do not think I understand the question exactly.

381 R. D. Q. Did you hear the question?

A. Yes.

382 R. D. Q. Has it been your practice to apply for patents upon all the modifications in the matter of detail upon principles that you have been working upon?

A. No, sir.

383 R. D. Q. Did you or not make many successful experiments

and embody the principles experimented upon in practical working apparatus, before the end of 1879, upon which no applications for patents were filed up to May 27th, 1881, and, if yea, give some general idea of the number?

Counsel for Maxim objects to the question as immaterial.

A. Yes; perhaps a dozen.

2619 384 R. D. Q. Did you or not use any kind of paper for the carbon filaments of electric lamps, and produce practical and operative lamps therefrom, before the end of 1879, upon which no applications for patents were filed up to May 27th, 1881, and if yea, state as nearly as you can the number, and name such specifically as you can now remember?

A. I will, without referring to books, answer from memory. I think a great many lamps were made containing different kinds of paper, on which no patents were applied for up to May, 1881; for instance, we made good operative lamps of manilla paper, United States currency paper, bond paper, parchment paper, bamboo paper, linen paper, bibulous paper, bibulous paper soaked in carbonizible compounds, straw paper, wood paper.

385 R. D. Q. Was the article in "Scribner's Monthly" in evidence intended to include, and did it as a matter of fact include, all the materials that you had used and made successful and operative lamps from up to the time of its preparation for publication?

Counsel for Maxim objects to the question unless the witness should admit that he was responsible for said article.

A. No; it was not a scientific article, but an article intended to give a general idea. It would be entirely out of place to describe all the experiments in an article of such a character. It does not include a fraction of the experiments tried, or the articles used in making incandescent lamps.

386 R. D. Q. I now call your attention to the twelfth bulletin of the Edison Electric Light Company in evidence, and to the second paragraph contained on the fifteenth page of the same as follows: "The second claim in Mr. Swan's first patent is for a straight strip of paper bent into a loop or horseshoe. This was the form first used by Edison, and probably by every other experimenter on lamps, but Edison improved upon it. His improvement consists in cutting the paper into shape instead of bending it, it being evident to any one that by cutting paper into exact shape greater uniformity 2620 of result can be obtained than by bending, and no special care about work is needed in insuring that all loops shall be uniform." Please state if the foregoing statement is true as a matter of fact, and that you authorized the same; or if your attention was specially called to the language used before or after the publication of the bulletin?

A. It is not true. My attention was not called to it; I did not authorize its being made. When properly qualified it might be true.

387 R. D. Q. You may make any explanation in regard to this bulletin and the special statement referred to, as you may desire.

A. I have nothing much to say about this bulletin except that it is published by the Edison Electric Light Company, and I have no authority over what goes into it, and I do not read it half the time. I know nothing of their opinion. I do not remember of ever reading it before being brought into this case. I stated that the paragraph in question might be true if qualified. If we consider the great difficulty of getting good carbons by proper devices for carbonizing them in a bent form, as against the simpler method of cutting them out, and carbonizing a number under pressure without these devices necessary with a bent carbon, then the statement would be true. It states that, "It is evident that by cutting paper in exact shape, greater uniformity can be obtained than by bending." This is not correct, because the filament can be cut straight with greater uniformity than if cut in a horseshoe shape; and the fact that at the time this bulletin was printed, and for a long time previous to that, all our lamps were made by cutting straight and bending, shows that the statement here is not correct when not qualified; so that our practice a long time previous, and at the time that the bulletin appeared, refutes the statement in the bulletin.

388 R. D. Q. Is there any other statement in the article on the Swan patent in that bulletin about which you wish to make an explanation—I call your attention to the last page of the article?

2621 A. In the third article it states that all the things claimed by Swan have been tried and discarded by Edison. That is to say, discarded for simpler and more economical means or more efficient means. I desire to state that the word "discarded" if meant abandoned, is not correct. The reason why the specific things are not used is because we have better things. If any person desires to give an order for any of those things we are ready to make them.

389 R. D. Q. Are you able now to make and furnish upon order, by the use of the methods pursued by you in 1879, commercial incandescent lamps provided with filaments of carbon made by cutting paper into straight strips and bending into the form of loops and carbonizing, and also commercial lamps made by the use of parchmentized paper?

A. Yes, sir.

390 R. D. Q. What proportion, if any, of the carbon filaments made by you before 1881, by cutting straight strips from paper or card-board and bending them into the form of loops, and then carbonizing, were either soaked with tar or lamp-black, or both?

A. I do not remember that any were coated with tar or lamp-black; I think several carbons were coated in tar. That is all.

391 R. D. Q. Please answer this question with regard to lamps provided with filaments of carbon made of parchmentized paper before 1881?

A. I am certain we did not soak or coat any parchmentized paper filaments with tar or lamp-black.

392 R. D. Q. Does the fact of the use of tissue paper in carbonizing between flat cut blanks signify in any way that the blanks were coated with tar or lamp-black, or both?

A. No, sir.

393 R. D. Q. Could you now, by the use of the blanks of 2622 carbon, the carbon placed with grooves, and the other devices that you have testified you used in 1879, make successful lamps with filaments cut straight from paper and bent into the form of loops before carbonization?

A. Yes, sir; we made them at the time and can do so now with the devices used at that time; but as I have already testified it was more difficult than with the flat carbons at that time. Not so great a percentage of good carbons could be obtained as by the other process.

394 R. D. Q. In addition to the statements made in your direct examination, and in your cross-examination by counsel for Swan and Maxim, have you now any further statement to make in regard to the use of parchmentized paper for carbons for electric lamps in 1877?

A. Yes, sir; I have been thinking the matter over last night, and I now know that I used parchmentized paper in 1877 for electric lamps.

395 R. D. Q. Have you examined the commercial Swan lamp of to-day?

A. Yes, sir; I have examined lamps made by Swan in England and imported into this country.

396 R. D. Q. What is the form or shape of the filament of carbon used in the Swan lamp?

Objected to as immaterial by Mr. Witter.

A. It is in the form of a spiral.

397 R. D. Q. Do you know the material of which that spiral is constructed?

Same objection.

A. I have received samples of material from England which is said to be that used for making his lamps, with the statement that it is parchmentized thread. From investigation with his lamp I find that he does not use the parchmentized thread to give light, but his carbon is coated with a deposit of hard carbon which radiates the light. This method is used by most all the makers of my lamp to cover up and render useful the filaments of car- 2623 bon which they do not seem to have learned how to make in a proper manner without the use of this coating of hard carbon.

398 R. D. Q. Do you find it necessary to employ this coating yourself?

A. No, sir.

Recross-examination by Mr. DUNCAN:

399 R. X Q. What do you understand to be the real object of this coating of hard carbon in such lamps as the Swan, and others referred to in your last answer but one?

A. They seem to have defects in the carbon which they state that this deposit of hard carbon eliminates and makes the lamp better.

400 R. X Q. The light as you understand it, is given off by the coating of hard carbon?

A. Yes, sir; when the hard carbon is deposited from the gas, the filament is very perfectly coated, so that the surface of the original filament is covered entirely by a coating of hard carbon which radiates light.

401 R. X Q. In that case what function does the parchmentized thread play in such a lamp as the Swan lamp?

A. It is used as a blank to effect its coating.

402 R. X Q. What other lamps did you refer to in the answer in which you have described the construction of the Swan lamp, when you spoke of most of the existing lamps as having blanks coated with hard carbon?

A. I referred to Lane-Fox, the Maxim, and other lamps on the continent of which I have had samples, but do not now remember the names of.

403 R. X Q. Is it your understanding that in all of these lamps which you have named, the light is given off by the coating of hard carbon, and that the original blank serves simply as the filament upon which to deposit that hard carbon?

2624 A. It is a combination filament, the original filament being a blank upon which the hard carbon is deposited, and if entirely coated, the hard carbon gives off the light, although the original filament acts as a conductor to the current as well as the outside coating of carbon, the whole forming a compound filament of carbon of two different qualities.

404 R. X Q. How have you refreshed your memory since yesterday as to the nature of the experiments which you made in 1877, particularly as to the character of the paper which you then used?

A. By thinking over the subject. I have already testified in some interference, that owing to the very poor character of the results obtained at this time, that it had not impressed itself upon my memory.

405 R. X Q. Did you use any parchmentized paper in making electric carbons in 1878?

A. Yes, sir.

406 R. X Q. Of whose manufacture?

A. I don't know.

407 R. X Q. How many carbons did you make in that year from such paper?

A. Mr. Batchelor, I think, made the carbons. I don't know how many he made with parchment paper. He made some.

408 R. X Q. It is a fact, is it not, that in 1879 you found it more difficult, with the appliances which you then had, to make good car-

bons for electric lamps, by cutting the blank out straight, and then bending and carbonizing it, than by first cutting it in horseshoe form and carbonizing it?

A. We found it more difficult to get as great a percentage, but when we did get one it was all right.

409 R. X Q. Will you explain precisely how you managed in cutting out those straight blanks in 1879?

A. Some were marked off by a lead pencil running around a form, and then cut with scissors, and others were cut between straight edges.

2625 410 R. X Q. How did you manage at that time in cutting out your curved blanks?

A. We made a form, which was doubled, and put the paper between the two parts of the form, and cut around the edges with a knife.

411 R. X Q. Of the carbons made with those two kinds of blanks, which proved to be the best?

A. I do not think we have put any records in evidence showing which was the best. I have stated that the carbons cut straight can be cut better and evener than those cut in a round form. I think I have some records in 1880 of blanks cut straight and carbonized while bent. I have not looked up the matter. It was not a question at that time of which was the best, but which was the most convenient way to get out the carbons.

412 R. X Q. Still, it is a fact, is it not, that of the carbons made in 1879, a larger percentage proved good when made from blanks cut out in a curved form, than when made from blanks cut out straight?

A. A greater percentage of the carbon filaments put in the mould came out good when cut in the form of a horseshoe than when cut straight and bent.

413 R. X Q. And how about the relative value of those carbons, when completed, at that time?

A. I think the carbons were as good, if not better than the others when we did get a good one; that is to say, when we did get a good straight carbon, it was as good if not better than a good carbon cut from a horseshoe; it is a mechanical question entirely.

414 R. X Q. Do your record books show that the one kind of carbons was as good if not better than the other?

A. None of those in evidence.

415 R. X Q. Do any others show it?

A. Perhaps they do; I have not looked.

416 R. X Q. So far as you know, do they?

A. I could not tell without looking to see.

417 R. X Q. You don't know then, that they do?

A. I do not know that I have records containing the re-
2626 sult of a competitive experiment between the two kinds, but
I think very probably that I have.

418 R. X Q. If you have, will you please produce such records and make them a part of your testimony?

A. If I have time I will look the records over, and if I find anything I will annex it.

419 R. X Q. You have, on your redirect examination, referred to the following paragraph in the twelfth bulletin of the Edison Electric Light Company, which is as follows: "All that Mr. Swan claims are only some minor features of alleged improvements, but it is doubtful if they really are improvements, all of them having been tried and discarded by Edison for simpler and more economical means equally or more efficient for the ends sought, long before Mr. Swan's patents were issued." You have said that under one interpretation of the word "discarded" this statement is not correct. Please state under what interpretation of the word "discarded" this statement would be correct.

A. For instance, if I were making a certain kind of lamp by one method, and I had devised another lamp with another method which was far superior to the previous one employed, I might stop making the inferior one and go ahead with the superior one. The word "discarded" might be employed to explain the stoppage in making the first kind or inferior lamp.

420 R. X Q. With that interpretation of the word "discarded," would that statement quoted from the bulletin be true?

A. It would be true that I do not use parchment paper, but do make lamps of filaments of bamboo cut straight and bent in the form of an arc, and carbonized while so bent.

421 R. X Q. I still desire to ask you whether the paragraph in question is true, except as the word "discarded" is to be qualified in the manner you have indicated?

A. It is true that I do not use parchment papers. It is 2627 also true that I do not use parchment paper cut straight and bent in the form of a loop, and carbonized while thus bent, at the present time. But I will fill orders for the same.

422 R. X Q. I understand you, on your redirect examination, to criticize this paragraph of the bulletin because the word "discarded" is liable to a misinterpretation. Have you any other criticism to make upon the accuracy of this paragraph, and if so, what?

A. I have no desire to make any further criticism.

423 R. X Q. So far as you know, is the paragraph susceptible of any other criticism?

A. Perhaps it may be.

424 R. X Q. What?

A. It is open to the criticism that the paragraph is not sufficiently explanatory.

425 R. X Q. Is it open to the criticism that it is not true, assuming your interpretation to be put upon the word "discarded"?

A. I cannot make any statement about the truth of the matter when the paragraph itself contains the words "it is doubtful."

426 R. X Q. Do you mean, then, to say that it is not doubtful?

A. It would be doubtful for a man to make an improvement on a thing which I had previously made in the same manner.

427 R. X Q. You said on your redirect examination, making reference to the second paragraph of page 15 of the twelfth bulletin of

the Edison Electric Light Co., that your practice at the date of the said bulletin, and for a long time prior thereto, refutes this statement contained in the bulletin. You, of course do not mean by that to imply that at the date of the bulletin—which is July 27, 1882—you were making the electric lamps with paper carbons?

A. No, sir; only in respect to the fact that we were cutting filaments straight, bending them and carbonizing them while so bent.

2628 428 R. X Q. Those filaments were made from bamboo?

A. Yes, they were made of bamboo, but in 1880 we made some of parchment paper.

429 R. X Q. And in making carbons from bamboo it is necessary to cut the blanks out straight, is it not?

A. Yes, sir; but it was not necessary to cut the parchmentized paper out straight that I made in 1880; nevertheless, we did so for the reasons that I have already testified to.

430 R. X Q. And it is practically impossible, is it not, to cut the bamboo blanks out in horseshoe form?

A. No, it is possible.

431 R. X Q. And to make carbons efficient for commercial lamps?

A. I have never cut out any in this form, but bamboo, if the stick is large enough, can be cut green, and flattened and shaved, and from which loops would be cut. Whether they would be commercially efficient I do not know. Narrow splints shaved down with an eighth of an inch wide might be cut with facility in the form of a loop.

432 R. X Q. You do nothing of that kind in your commercial lamps?

A. No, sir.

433 R. X Q. And never have?

A. I don't remember.

434 R. X Q. You understand the second paragraph on the 15th page of the twelfth bulletim to relate to lamps having carbons made from paper, do you not?

A. It is hard to say what the interpretation may be. It states: "The claim in Mr. Swan's patent is for a straight strip of paper, bent in a loop or horseshoe;" then it also states: "This was the form first used by Edison." Now, whether it refers to the form of the thing independent of the material, or whether in speaking of the form it means a paper form, it is difficult to say. Several interpretations might be put upon the paragraph.

2629 435 R. X Q. I asked you for your understanding of that paragraph; whether you do not understand that that paragraph is dealing with the subject-matter of Swan's second claim, and whether you do not understand that second claim to relate to a carbon made from paper?

A. It is stated in such a muddy way that I cannot understand it.

436 R. X Q. The paragraph in question is as follows: "The second claim in Mr. Swan's patent is for a straight strip of paper bent into a loop or horseshoe. This was the form first used by Edison, and probably by every other experimenter on lamps, but Edison

improved upon it. His improvement consists of cutting the paper into shape instead of bending it, it being evident to any one that by cutting paper into exact shape, greater uniformity of result can be obtained than by bending it, and no special care or work is needed in insuring that all loops shall be uniform." Do you not understand that that paragraph relates to carbons made from paper?

A. No, sir; I cannot understand whether in this paragraph he means the bare fact of cutting straight and bending, or whether the main thing was paper and did not refer to any filament cut straight and bent.

437 R. X Q. Do you understand that the making of a carbon out of bamboo, cut straight and bent and carbonized, would be an anticipation of Swan's second claim, which, as referred to in that paragraph, relates to a paper carbon?

A. No, sir; the claim is for paper.

438 R. X Q. You state on your redirect examination that among the various inventions made by you before the end of 1879, and on which you had not applied for patents prior to May 27th, 1881, there were carbons made from manilla paper, from linen paper, from straw paper, from United States currency paper. Have you made any applications for patents on these various kinds of paper since may 27th, 1871?

2630 Counsel for Edison objects to the question as incompetent and immaterial, and the witness is instructed that he need not answer the same.

Cross-examination by Mr. H. A. Seymour, counsel for Swan:

439 R. X Q. In your answer to the first question on redirect, you do not mean to be understood as stating that it is not your practice to apply for and obtain patents on modifications which are in your opinion of value and importance, do you?

A. If the modifications are of value and importance I generally apply for a patent.

440 R. X Q. And also you generally embody such modifications in caveats, do you not?

A. Of late years I have not filed many caveats; most all are embodied in applications.

441 R. X Q. Was the carbonized paper used by you in 1887 in experimenting, as you have testified, pieces of paper originally carbonized for the purpose of conducting experiments on improvements in telephones?

A. I think some of the paper used in experiments in 1877 was carbonized for another purpose, perhaps some of the carbon used had been previously used in the telephone.

442 R. X Q. You are quite positive of this fact, are you not?

A. No, sir; not perfectly positive.

443 R. X Q. Will you please give the date of your first application wherein you mentioned the employment of paper for the manufacture of carbon for incandescent electric lamps?

A. I think the first patent is No. 223,898, filed November 4th, 1879, and I think it is the first application.

444 R. X Q. Your 1878 experiment was conducted in a lamp of substantially the construction as that shown in the patent No. 224,329, dated February 10th, 1880, was it not?

A. Yes, sir.

2631 Counsel for Swan here gives notice that he will introduce in evidence a printed copy of letters patent No. 224,329, granted to T. A. Edison, February 10th, 1880.

445 R. X Q. And the paper carbons then used or experimented upon were in the form of sticks or rods as shown in this patent; that is to say, they were rolled up to make a stick?

A. The paper carbons used in this lamp were rolled up to make a rod.

446 R. X Q. But such carbons were not used as incandescent carbons, I understand. Am I correct?

A. Without refreshing my recollection I think we did try experiments with these carbons in vacuum.

447 R. X Q. Why was no mention made in this patent, the application for which was filed February 3d, 1879, of paper for the manufacture of the carbon?

A. Because the patent was for a lamp, and I could not have patented the lamp and patented the process of making carbons for the same in one patent; besides any form of carbon could be used in such a lamp. Hence the patent was for a lamp to work carbons in a peculiar way.

444 R. X Q. Did you not, in November or December 1879, make an application for a patent wherein you did claim the construction of a lamp and also claimed carbon made of paper. I now refer to the application, which is a substantial copy of English patent No. 5127?

A. Yes, sir; but in this case the carbon itself was the lamp, whereas the application of February 3d, 1879, was for a peculiar mechanism forming a lamp. I do not think the Patent Office would have permitted the patenting of two things; that is to say, the mechanism of the lamp and any peculiar form of carbon in the same patent as filed February 3d, 1879, whereas, it was permissible in case of the patent filed some time in November or December, 1879, containing the paper carbon.

2632 449 R. X Q. At the time you experimented with the lamp in the fall of 1878, had you discovered the superiority of carbon made of paper for incandescent electric lighting over other carbon?

A. We had discovered that it was a very easy form of material to manipulate to make conductors for electric lights.

450 R. X Q. (Question repeated.)

A. We knew that carbon made of paper was preferable for incandescent lighting, for the reason that it had a higher resistance than carbon made from hard carbon.

451 R. X Q. I read as follows from your deposition in the inter-

ference case of Sawyer and Man against Edison: "Cross-question 196. At the time you experimented with this lamp of the patent referred to (224,329), had you discovered the superiority of carbon made of paper for incandescent electric lighting over other carbon? A. No; only it was very convenient material to use." Did you testify as above in the interference in question?

A. I think I did. I also think in some other part of this testimony, that I stated that we found it had other advantages, to wit, having high resistance

452 R. X Q. In 1879, how long did you consider that an incandescent filament should burn in order to constitute a lamp which you would have considered a commercial success, or an improvement of any practical benefit to the public?

A. That would depend upon the economy of the lamp. With the lamps we made in the latter part of 1879 and early part of 1880, with the economy that they then had, one hundred hours would have been a commercial success; a greater length of time would have made them of a greater commercial success.

453 R. X Q. What was your aim in 1879; to produce a carbon filament of high resistance, or to produce a carbon filament that should be easy to manufacture regardless of its resistance?

2633 A. Our endeavors were to make a lamp containing a filament of carbon of as high resistance and of as great a life as possible, irrespective of the cost.

454 R. X Q. Cost of manufacture was considered as a very small factor in the conduct of your experiments in 1879; in other words, your sole and main object and purpose was to obtain a carbon of high resistance to insure economy in the operation of an incandescent system?

A. Our object was to produce a lamp of as high resistance as possible, and with as great economy and life at that resistance and produce a great number of lamps which when placed on the circuit would have all the same candle power and concentration, independent of its cost, knowing that when once we obtained what we desired by means of machinery and other things we could make them sufficiently cheap for all commercial purposes.

455 R. X Q. Subsequent to your experiments with carbon filaments in 1877, and also of similar experiments in 1878, you made many experiments and at great expense with other materials than carbon in order to obtain a practical burner for an incandescent lamp, did you not?

A. Yes, sir.

456 R. X Q. In your Note Book No. 52 you have recorded a test of a large number of different kinds of paper; did you ever make an application for a patent for an incandescent carbon, made from any of the different kinds of paper therein referred to, except that involved in this interference?

Counsel for Edison objects as incompetent and immaterial, and as calling for information that is privileged, and that the witness is entitled to withhold it on account of the detriment which would accrue to his interests by the disclosure of the same, and the witness is instructed not to answer the question.

457 R. X Q. On your redirect examination you were asked if prior to 1880 you had not experimented with many different kinds of paper for which you had not applied for a patent prior to 2634 May 27th, 1881, and you answered affirmatively and enumerated several different kinds of paper which you stated you used or tested in the fall of 1879 and for which you had made no application for a patent up to May 27th, 1881. Now, I desire to know if by this answer you would have it understood or inferred that you have ever made an application for a patent for a carbon made of any of the different kinds of paper referred to by you in your testimony except parchment paper.

A. I cannot remember whether I have or not. I do not clearly understand the question.

458 R. X Q. As your memory fails you in this matter, and, as you keep full records of all your applications, will you please refer to your records for the purpose of ascertaining whether or not you have subsequent to May 27th, 1881, made an application for a patent, one or more, for any of the different kinds of paper you referred to?

Counsel for Edison objects as incompetent and immaterial, and as calling for information that counsel for Swan is not entitled to; and the witness is instructed not to answer the question.

459 R. X Q. Please give the dimensions of the carbons made in the latter part of 1880 from vulcanized fibre, or what you have sometimes called parchment paper; give approximately the length and width and thickness.

A. I don't remember exactly the size, but I think they were about six inches long, eight one-thousandths thick, ten one-thousandths or twelve one-thousandths wide.

460 R. X Q. Please describe the form of the vulcanized fibre from which these filaments were made.

A. It was a sheet, I should say, two feet square, and I am not sure whether it was rolled to the right size, or whether it had to be scraped or shaved down. If it had to be shaved down, a very little had to be shaved off. These are the ones made, I think, by Mr. Bradley.

461 R. X Q. Does the Edison Company own your invention that is involved in this interference?

A. Yes, sir.

2635 462 R. X Q. Were you an officer of the Edison Company July 27th, 1882, the date of the publication of bulletin 12?

A. No, sir; I am the inventor of the company.

Adjourned to Tuesday, June 5th, 1883, at 10 a. m.

Met pursuant to adjournment and adjourned by consent to Wednesday, June 13th, '83, at 10.30 a. m.

Met pursuant to adjournment and adjourned by consent to Thursday, June 28th, 1883, at 10.30 a. m.

Adjourned by consent to Friday, June 29th, '83, at 10.30 a. m.

Met pursuant to adjournment this 29th day of June, 1883.

Present: W. C. Witter and H. A. Seymour for Swan, and Richard N. Dyer and Eugene H. Lewis for Edison.

Deposition of THOMAS A. EDISON continued.

Recross-examination — H. A. SWAN, counsel for Swan:

463 R. X Q. Will you now produce in evidence your original Record Book No. 85?

The witness is instructed by his counsel not to answer this question, and it is stated that the original Record Book No. 85 will not be produced in evidence to any greater extent than has already been done.

2636 464 R. X Q. Will you produce in evidence photographic copies of all the pages of your original Record Book No. 85, retaining the book itself in your possession?

The witness is instructed not to answer, and the request of counsel for Swan is refused for various reasons, a sufficient reason being that the pages of Book 85 which have not already been produced are not material to this controversy, but are material to other controversies.

465 R. X Q. Will you produce your original Record Book No. 85 and allow counsel for Swan to inspect the main portion of the book which has not thus far been introduced in evidence and has thus far been carefully concealed from such inspection; by main portion I mean all of the pages except such as have been introduced in evidence?

The same instruction is given witness and the same reply made to the request.

466 R. X Q. Will you produce in evidence all of the pages of Record Book No. 85, on which are recorded the tests of the lamps referred to in Record Book No. 52?

It is stated by counsel for Edison that photographs of all the pages of Book No. 85 have been put in evidence, on which are recorded the tests of all such lamps referred to in Book No. 52 as are material to the issues of this controversy, and counsel for Swan and Maxim have been given full opportunity to examine the pages of Book No. 85 of which photographs have been put in evidence. The request of counsel for Swan is refused and the witness is instructed not to answer the question.

Counsel for Swan admits that he has been allowed to examine the few pages of Book 85 of which photographs have been introduced for the purposes of comparison, but asserts that all the remaining portions of the book have been carefully strapped and pinned up so as to render every other portion safe from inspection. As to 2637 the materiality of the remaining portions of the book, counsel for Swan insists that the office should be the judge instead of counsel for Edison.

467 R. X Q. Will you produce in evidence or for inspection all the record or memorandum books of experiments or tests, including Record Book No. 52 and No. 85, relating to paper carbons for incandescent lights, which were kept during the period covered by your testimony in this interference, from August, 1877, to the date of the Swan patent?

It is stated by counsel for Edison that a compliance with this request would bring into the case and make public a vast amount of matter not in any way material to the controversy, but which is or may be material to other controversies. The witness is instructed not to answer the question.

468 R. X Q. Were you ever an officer or director or trustee of the Edison Electric Light Company?

A. Trustee and director.

469 R. X Q. Covering what period of time?

A. I have been a director since the organization of the company and am now.

THOMAS A. EDISON.

2638 COMPLAINANT'S EXHIBIT EDISON FILE-WRAPPER AND CONTENTS. W. T. F., Examiner. April 10, 1889.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE.

To all persons to whom these presents shall come, Greeting:

This is to certify that the annexed is a true copy from the files of this office, of the file-wrapper and contents, in the matter of the application of Thomas A. Edison, filed December 11, 1879, serial number 14630, for improvement in electric lamps, and method of making the same.

In testimony whereof I, Benton J. Hall, Commissioner of Patents, have caused the seal of the Patent Office to be affixed [SEAL.] this 28th day of March, in the year of our Lord one thousand eight hundred and eighty-nine, and of the Independence of the United States the one hundred and thirteenth.

BENTON J. HALL,
Commissioner.

Model, 1 drawing, $15 check.

To the honorable Commissioner of Patents:

Your petitioner, Thomas A. Edison, of Menlo Park, in the State of New Jersey, prays that letters patent may be granted to him for the invention of an improvement in electric lamps, and in the method of manufacturing the same set forth in the annexed specification. (Case No. 187.)

2639 And further prays that you will recognize Lemuel W. Serrell, of the city of New York, N. Y., as his attorney with full power of substitution and revocation, to prosecute this application, to make alterations and amendments therein, to receive the patent and to transact all business in the Patent Office connected therewith.

THOMAS A. EDISON.

Menlo Park, Dec. 8th, 1879.

UNITED STATES OF AMERICA.

STATE OF NEW JERSEY, }
County of Middlesex. }

On this eighth day of December, in the year one thousand eight hundred and seventy-nine, before the subscriber, a notary public in and for said State, personally appeared the within named Thomas A. Edison, and made solemn oath that he verily believes himself to be the original and first inventor of the within-described improvement in electric lamps, and in the method of manufacturing the same, and that he does not know and does not believe that the same was ever before known or used, and that he is a citizen of the United States, and a resident of Menlo Park, New Jersey.

THOMAS A. EDISON.

Sworn to before me the day and year above written.

S. L. GRIFFIN,
Notary Public.

[L. S.]

To all whom it may concern:

Be it known that I, Thomas Alva Edison, of Menlo Park in the State of New Jersey, United States of America, electrician, have invented an improvement in electric lamps and in the method of manufacturing the same, of which the following is a specification.

2640 In a former application made by me for letters patent in the United States (case 186) an improvement in electric lamps is set forth wherein a filament of carbon is inclosed in a glass bulb and the atmosphere removed as nearly as possible, and the carbon is brought to incandescence by an electric current to form the lamp.

My present invention relates to an improvement in the process of manufacturing the carbon filament and in the means for securing the same to the conductors.

I make use of paper of the desired thickness as free as possible from foreign substances or adulterations and for this purpose I prefer and use "bristol-board." With suitable instruments, such as a punch and die, I, cut out a narrow strip of this paper, preferably in the form of an elliptical bow or an arc of a circle, the ends of the strip being by preference wider than the other portions.

A number of these pieces of paper are laid flatwise in the bottom of a mold, preferable of wrought iron, and there is laid on them a light weight in the form of a flat piece of gas-retort carbon or other device that will not be distorted by the heat. If several of these are laid one on the other in the mold, a piece of tissue paper is interposed between each one and the next.

A cover is used to close the mold and the mold is raised very gradually to a temperature of about six hundred degrees Fahr. This allows the volatile portions of the paper to pass away and at the same time the mold retains the paper in its proper shape and the paper is prevented from curling up or becoming distorted as it would be likely to do if the heat
2641 were applied suddenly, or the light weight dispensed with.

The mould is now placed in a furnace and heated almost to a white heat and then removed and allowed to cool gradually.

The carbon filaments will be found to be smaller than the card-board blanks and to be sufficiently strong and flexible for handling. The ends of the carbon are to be secured to the metallic conductors in any convenient manner—

The carbon filaments prepared as aforesaid are very uniform in their resistance to the electric current, and I make them thin and of a sufficient length to offer a great resistance to the passage of the current.

The clamps that connect the conductors to the ends do not require to be pressed with much force on the carbon, because the resistance to the passage of the current between the clamps and the carbon will be less than the resistance of the carbon filament, hence but little heat will be developed at the clamps.

In ordinary electric lamps the large

carbons do not offer much resistance to the electric current and unless the clamps are very firmly pressed upon the carbon, the current meets with considerable resistance at the clamps, and hence heat is developed at such clamps.

The clamps that I prefer are made of a steel spring tipped at the ends with platina or similar metal; the spring is bent into a circle or bow and the
2642 ends crossed and turned back towards each other similar in shape to the figure 8 with the opening for the carbon between the spring ends at the upper part: the object of this shape is that the pressure of the clamps on the carbon may be increased by the expansion of the spring by the heat of the lamp, instead of being lessened as it would be if the wire, was only bent into a single bow.

The spring clamps are connected to the platina or similar conducting wires by dips, and the platina wires pass through the glass of the globe or bulb that contains the lamp: the air is to be exhausted from the bulb by any suitable means and it is preferable to exhaust said air as perfectly as possible, say to the one eight-hundred thousandth of an atmosphere.

The lamps are suspended or supported in any convenient manner, and the electric current from a magneto-electric machine, or other source of electricity is passed through the lamp and brings the carbon filament to a high incandescence and the lamp is very durable and a large number of such lamps can be placed in the electric circuit in multiple arc, or otherwise as desired.

In the drawing:—

Fig. 1, is a vertical section of the lamp complete.

Fig. 2, is a side view in larger size of the clamping device.

2643 Fig. 3, is a section at the line *x x*, in still larger size.

Fig. 4, is the wire forming one of the clamps before it is bent up to shape.

Fig. 5, is the paper blank before it is carbonized, and Fig. 6, is a section of the box.

The blank *a*, is cut out of paper material such as "bristol-board," in the proper shape; the form shown in Fig. 5, is preferred.

The same is laid in the metal mold *b* and when several are laid one on the other, pieces of thin paper are introduced between them. The weight *d*, is laid on these; it is to be heavy enough to prevent the paper curling up under the action of the heat, but it allows the paper to contract as the volatile matters are expelled by the heat. This weight *d*, is of gas-retort carbon. The cover *e*, is placed on the mold and secured, and the mold is heated as before described.

The carbon filament *i*, forms the lamp when rendered incandescent by the electric current passed through it.

The clamp is made of the wire *h*, at the ends of which are tips or small rivets *r*, of platina or similar material.

The wire is bent up and crossed as shown so as to act as a spring in clamping the end of the carbon filament that is placed within such clamp. The wire is attached to a small stock *o*, into which the conducting wire *t*, passes and is clamped.

The conductors for the two ends of the carbon are inserted into the glass and
2644 the latter intimately melted around
them, the carbon and clamps are connected to the wires and the parts introduced within the neck of the bulb *m* and the glass melted at *v*, the air is exhausted from the globe by the tube *k*, that passes away as shown by dotted lines, and the tube melted together while the vacuum is maintained.

The lamp is ready for the conductors to be attached to it and the carbon is rendered incandescent by the current that passes through the same. It is durable as there is nothing to combine with the carbon and it is substantially indestructible.

I claim as my invention

First. The manufacture of carbons for electric lights from paper.

Second. The method herein specified of manufacturing carbons for electric lights consisting in exposing the filaments of paper to the action of heat in a mold to drive off the volatile portions and carbonize the paper, substantially as set forth.

Third. A carbon for electric lights made as a filament with the ends broader for the clamping devices that connect the conductors.

Fourth. The clamp for the carbon of an electric lamp composed of a bow or elliptical spring with the ends crossing each other and receiving between
2645 them the carbon substantially as set forth.

Signed by me this 8th day of December, A. D., 1879.

THOMAS A. EDISON.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
WASHINGTON, D. C., *Dec.* 30, 1879.

Case 187.

T. A. Edison, care L. W. Serrell, box 4689, N. Y. city.

Electric lamps and methods of making the same. Filed Dec. 11, '79.

Claim 1 is ambiguous, it not being clear whether the claim covers an article or a process. Claim 3 is too broad. The word filament does not distinguish applicant's carbon from others except in degree.

C. L. BUCKINGHAM, *Ass't.*

H. C. TOWNSEND, *Ex'r.*

(Endorsed: 146–30; rejection, Dec. 30, 1879.)

2646 NEW YORK, *January* 2, 1880.

Hon. Com. of Patents.

SIR: In the matter of my application No. 187 for patent on electric lamps filed Dec. 11, 1879 I amend the specification by inserting after title
"(case No. 187)"

The first claim is erased and the following substituted

"First. An electric lamp formed of carbonized paper."

The third claim is believed to be correct, no other meaning than "thread-like" is known to attach to the word "filament" and this claim is meant to apply to a thread-like carbon with broad ends and that is believed to be new.

Respectfully yours, THOMAS A. EDISON,
Per LEMUEL W. SERRELL, *Att'y.*

(Endorsed: 146–30; "A;" 2; amendment; Jan. 3, 1880; cancelled; Thos. A. Edison; electric light; case 187; amendment; U. S. Patent Office, Jan. 3, 1880.)

To the Comm'r of Patents:

In the matter of my app'n for patent for imp't in electric lights No. 187 filed December 11, 1879, I hereby appoint G. W. Dyer and Z. F. Wilber of the firm of Dyer & Wilber, associate attorneys to prosecute said application, to make alterations and amendments 2647 therein, to receive the patent, and to transact all business in the Patent Office connected therewith in my place and stead.

Correspondence to be with them.

Signed at Menlo Park, New Jersey, this 24th day of January, 1880.

T. A. EDISON.

Hon. Commissioner of Patents.

SIR: In the matter of my application No. 187 for a patent for "electric light" filed Dec. 11th, 1879—I amend as follows:

Cancel amendment of January 3d, 1880.

Erase words "filament of" in 11th line, 1st page.

Erase "filament" line 18, page 1.

Insert after line 19, page 1,

"I have found, that it is desirable in an electric lamp that there should be a very great resistance in a very small amount of incandescing material, and that carbon prepared from paper by my process possesses the necessary high resistance.

By using such carbon, I am enabled to use an exceedingly small carbon so small that its dimensions are best expressed by applying to it the term filament, it being thread-like in size."

Erase first claim and insert—

"First. The incandescent conductor, for an electric lamp formed of carbonized paper, substantially as set forth."

It is believed these amendments obviate the office objections.

DYER & WILBER,
Att'ys for Edison.

Feb. 17th, '80.

(Endorsed: 146–30; "B–C;" 4; amendment Feb. 17, 1880; Edison, 187; room 118; U. S. Pat. Office, Feb. 17, 1880.)

2648 Copied.

U. S. Patent Office,
Ex'r of Interferences,
September 25, 1880.

T. A. Edison, care Dyer & Wilber, present:

Please find below a copy of a communication from the examiner concerning your application filed Dec. 11, 1879, for electric lamps, etc., (case No. 187.)

Very respectfully,
E. M. MARBLE,
Commissioner of Patents.

Room No. 152.

All communications should be addressed to "The Commissioner of Patents, Washington, D. C."

Your case, above referred to, is adjudged to interfere with others hereafter specified, and the question of priority will be determined in conformity with the rules.

The statement demanded by rule 105 must be sealed up and filed on or before the 25th day of October, 1880, with the subject of the invention, and name of party filing it, indorsed on the envelope. The subject-matter involved in the interference is

The incandescent conductor for an electric lamp formed of carbonized paper.

Edison's 1st claim, Sawyer and Man's 4th claim.

2649 The other parties to this interference are Sawyer and Man, whose application was filed Jan. 9, 1880, No. 547.

Wm. E. Sawyer, New York city.

Albon Man, Brooklyn, N. Y. Care Baldwin, Hopkins — Peyton, asso. att'ys, Washington, D. C.

H. C. TOWNSEND, *Examiner.*

P. W. PAGE, *Ass't Ex'r.*

(Indorsement: 146–30; 5 int. 155–73; Sept. 23, '80.)

(Edison, number 187.)

T. A. Edison, electric lamps. Room 152. Filed Dec. 11th, 1879.

Hon. Commissioner of Patents:

This application is now in interference with an application filed by Sawyer and Man, as to a part of the subject-matter contained therein only, there being claims and subject-matter not interfering with the claims made by Sawyer and Man, or with any claims which could be made upon the subject-matter shown or described by them.

The application can be legitimately divided. 2650 I have therefore determined to take advantage of the provisions of rule 125, cancel by amendment the matter herein adjudged not to interfere, and to file a new application therefore, which application is this day filed and bears my serial number 264, and which is, as to such matter, a continuation of this application relating back thereto.

The present application is accordingly amended as follows:

Erase the words "and in the means for securing the same to the conductors," lines 18 & 19, page 1.

Erase from line 5, page 4, to line 13, page 5 inclusive and insert in lieu thereof:

"In order that not only the improvement in the carbon may be understood, but that the manner of the embodiment in a complete lamp, and its utility may be better understood, a complete lamp and the method of its manufacture will be illustrated and described."

In lines 25 and 26, page 6 erase "is attached to" and insert "passes through."

In line 10, page 7 erase "that passes away" and insert "which originally is."

In line 11, page 7, erase "and the tube" and insert "but which is."

At end of line 11 insert "when a 2651 proper vacuum has been attained."

Before claims insert:

"It is not intended to claim anything herein shown and described except the incandescing conductor made of paper, as all such other matters of invention as are herein shown or described are only shown as incidental to, and illustrative of the manner of manufacture and use of the paper carbon, and from the subject-matter of another and separate application for a patent made by me."

Erase all claims except the first.

T. A. EDISON,
Per DYER & WILBER,
His Attorneys.

Washington, D. C., December 15, 1880.

(Endorsement: 146–30; No. 1876; 152. Amendment, Dec. 15th, 1880, "B. D." U. S. Patent Office, Dec. 15, 1880.)

"Incandescent paper carbons."

Hon. Commissioner of Patents.

Sir: In the above-entitled cause, please recognize the Hon. Roscoe Conkling as an associate in the case.

He will take charge of the argument on appeal.

Very respectfully, &c., Z. F. WILBER.

(Endorsement: Asso. att'y to Hon. Roscoe Conkling, Feb. 18, 1882.)

In Re Edison, case 187.

T. A. Edison, electric lamps. Filed December 11, 1879.

Hon. Comm'r Patents.

Sir: This app'n is in interference — a subject-matter set forth in one claim out of four in a pending app'n of Sawyer and Man.

The remaining 3 claims in the Sawyer and Man app'n stand rejected.

2653 In the declaration of the interferences in the letter to Sawyer and Man, the office stated "In declaring this interference the objections standing against Sawyer and Man's 1, 2 and 3 claims are not removed."

In view, however, of the very peculiar rules now prevailing in the office as to declaring interferences and as to when applications interfere, there is great risk, should the examiner change the decision in such claims, or he be overruled by any of the appellate tribunals, that such claims might be issued without notice to me and in derogation of my rights under the law. I therefore amend by adding such claims to my application in order that nothing possible to be done by me in the matter, be left undone.

Formal action thereon, however, will not be expected until the termination of the present interference proceedings.

Insert the numeral 1 before present claim in case and add claims.

"2. An incandescing arc for an electric lamp of carbonized fibrous or textile material, of an arch or horseshoe shape, substantially as set forth.

"3. Th*is* combination of an incandescing arc of carbon for an electric lamp, of an aren or horseshoe shape, and a transparent hermetically sealed chamber, from which oxygen or other gases capable of combining with carbon at a high temperature are excluded.

"4. The combination of an incandescing arc of carbon for an electric lamp of an arch or horseshoe shape included in and forming part of an electric circuit, and a transparent hermetic-
2654 ally sealed chamber, from which oxygen and other gases
capable of combining with carbon at a high temperature are excluded."

Thomas A. Edison, care Richard N. Dyer, 65 5th Ave., New York city.

"Application electric lamps and method of making the same."
Filed Dec. 11, 1879, Book No. (146–30).

The interference with Sawyer and Man having been decided against applicant, this case has been reconsidered with reference to the amendment filed March 11, 1882.

Reference is made in the specification to another application which is referred to as "(case 186);" the number thus given, fails to identify the case referred to, and if the reference is retained, the date of filing should be given.

It is also found that by amendment filed Dec. 15, 1880, applicant limits the scope of this application to an "incandescing conductor made of paper;" the claims presented by amendment of March 11, 1882, which cover matter different from an incandescing conductor made of paper, are therefore, not properly in this case.

Besides this, the first claim which is commensurate with the issue of the late interference cannot be allowed to applicant, since the interference has been decided in favor of Sawyer and Man; the second claim which is broader than the interference issue cannot be considered in this case for this reason alone. A defeated party cannot put under contribution the party which has been proved to be the prior inventor.

Claims 3 and 4, are anticipated by English patent No. 3809 of 1872, Fig. 8.

The application is rejected.

C. J. KINTNER, *Examiner.*

JOS. LYONS,
First Assistant.

(Endorsed: No. 146–30. Paper No. 10. Rejected. Dated Feb. 19, 1885.)

2667 Thomas A. Edison, electric lamps. Filed December 11, 1879. Edison, No. 187.

To the Commissioner of Patents:

SIR: In the above case I submit the following:

Erase the disclaimer inserted before the claims and designated amendment "D."

Erase 2d, 3d, and 4th claims inserted by amendment, dated March 10, 1882, and insert instead thereof the following:

Second. An incandescing conductor for an electric lamp, of carbonized fibrous or textile material, and of an arch or horseshoe shape, substantially as hereinbefore set forth.

Third. The combination substantially as hereinbefore set forth, of an electric circuit and an incandescing conductor of carbonized fibrous material, included and forming part of said circuit, and a transparent hermetically sealed chamber in which the conductor is inclosed.

Fourth. An incandescing electric lamp consisting of the following elements in combination: first, an illuminating chamber made wholly of glass hermetically sealed, and out of which all carbon-consuming gas has been exhausted or driven; second, an electric circuit conductor passing through the glass wall of said chamber and hermetically sealed therein, as described; third, an illuminating conductor in said circuit, and forming part thereof within said chamber, consisting of carbon made from a fibrous or textile material, having 2668 the form of an arch or loop, substantially as described, for the purpose specified.

In the issue of patent No. 317,676, based on an application of Sawyer and Man, after an interference with this application, the office evidently overlooked the fact that the issue in that interference was upon the use specifically of carbonized paper as the incandescent conductor of an electric lamp, and, proceeding upon the illogical reasoning that the less includes the greater, granted a patent for the use of fibrous material without an interference with this application. To prevent just such an occurrence, applicant during the pendency of the interference inserted a claim to fibrous material, and demanded an interference with the application of Sawyer and Man whenever the office should decide that the claim was patentable. Sawyer and Man's claim at the time standing rejected.

This amendment and demand is the paper dated March 10th, 1882, and filed March 11, 1882.

The present amendment is made so that the claims will conform precisely to the claims of Sawyer and Man, as since amended, and an interference is now demanded with the first, second and fourth claims of their patent No. 317,676.

The claim on carbonized paper is retained, since it is proposed to commence proceedings to obtain a patent on this claim by bill in equity under section 4915 R. S.

Respectfully,

RICHARD N. DYER,
Attorney for Edison.

June 19, 1885.

2669 STATE OF NEW YORK, }
County of New York, } *ss:*

Thomas A. Edison, whose application for letters patent for an improvement in electric lamps was filed in the United States Patent Office on the 11th day of December, 1879, being duly sworn, deposes and says that he verily believes himself to be the original and first inventor of the improvement as described and claimed in the foregoing amendment, in addition to that which was embraced in the claims originally made, and that he does not know and does not believe that the same was ever known or used before his invention thereof, and that the matter sought to be inserted formed a part of his original invention at the date of filing said application.

THOS. A. EDISON.

Sworn to and subscribed before me this 19th day of June, 1885.

JOHN C. TOMLINSON,
[L. S.] *Notary Public, N. Y. Co.*

(Endorsed: No. 146–30; paper No. 11; am'd't F. Filed June 20, 1885, 91; U. S. Pat. Office, Jun- 20, 1885; division XVI.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
WASHINGTON, D. C., *June* 27, 1885.

Mailed June 30, 1885.

Thos. A. Edison, care R. N. Dyer, New York city.

Improvement in electric lamps, No. 146–30. Filed Dec. 11, 1879.

2670 The amendment filed 20th inst., in the matter of the above-named application has been considered.

In view of the limited statement of invention found in the application as originally filed, the claims then submitted and particularly in view of the specific terms of the disclaimer filed Dec. 15, 1880, it is believed that the last official action of Feb. 19 was correct, and that applicant cannot now be allowed to broaden the scope of his alleged invention by putting up a new state of facts. It appears that applicant has specifically disclaimed all matter in this application except the paper filament, and upon this state of facts entered into and passed through an interference proceeding in which contest he failed to succeed. He has also signified his intention, in the last amendment, of proceeding by a bill in equity to have the Commissioner's decision reversed.

The examiner is firmly of the opinion that he should proceed in this course direct and not be now permitted to set aside as for naught that which he, the applicant, has in a clear and well-defined manner delineated as his invention.

If this course of proceedings were admissible there would be no end to litigation.

By his own actions must an applicant's case stand or fall, and when he distinctly rules out a line of action designed to govern his application, by that line of action must he be held.

Applicant will be required to reinstate his disclaimer and to erase all matter not in strict accord therewith, in order that he may proceed by bill in equity as indicated.

From this action refusing to admit the claims now submitted and requiring applicant to reinstate the disclaimer noted, an appeal may be taken at once, if desired, to the Commissioner in person.

Further action pending such appeal is suspended.

C. J. KINTNER, *Examiner.*

(Endorsement: Serial No. 146–30; paper No. 12; rej.; dated June 27, 1885.)

2671 Thomas A. Edison, electric lights. Filed December 11, 1879.

To the honorable Commissioner of Patents.

SIR: In the above-entitled case, appeal is hereby taken to the honorable Commissioner in person from the decision of the principal examiner, refusing to grant applicant's request for an interference with patent of Sawyer and Man, No. 317,676, granted May 12, 1885.

For reasons of appeal it is submitted that the examiner erred:

(1.) In deciding that his action of February 19th, 1885, was correct;

(2.) In deciding that the amendatory paper filed March 11th, 1882, did not entitle Edison to an interference with Sawyer and Man's application while pending;

(3.) In deciding that Edison, is not now entitled to an interference with their patent.

An oral hearing is asked.

Respectfully, RICHARD N. DYER,
Attorney for Edison.

July 8th, 1885.

(Endorsement: Filed Dec. 11, '79; paper No. 13; interlocutory appeal; filed July 11, 1885; Mr. Emory, room 4; the request for a declaration of an interference with the patent of Sawyer and Man, is denied, for the reasons stated by the examiner; Benton J. Hall, Commissioner; Feb. 24, 1888; United States Patent Office, July 11, 1885.)

WASHINGTON, D. C., *July 14th*, 1885.

In the Matter of the Application of THOMAS A. EDISON, "Electric Lights." } Interlocutory Appeal.

Filed Dec. 11, '79.

SIR: You are hereby informed that a hearing on the above appeal from the decision of the primary examiner is fixed for Friday, July 31st, 1885, at 1 p. m.

By direction of the Commissioner.

Very respectfully, SCHUYLER DURYEE,
Chief Clerk.

Thomas A. Edison, care Rich'd N. Dyer, 65 5th Ave., N. Y.

(Endorsed: Serial No. —; paper No. 14; notice of hearing; dated July 14, 1885.)

2673 In the U. S. Patent Office.

In Re T. A. Edison, electric lights. Filed Dec. 11, 1879. Appeal to the Commissioner of Patents.

Examiner's Statement.

This appeal is taken from the examiner's decision refusing to declare an interference between certain claims specified, and similar claims found in patent to Sawyer and Man, 317,676, granted May 12, 1885.

The examiner's refusal was based upon three reasons as follows:

1. This application was involved in an interference with the application upon which Sawyer and Man's patent was granted, and decided adversely to applicant.
2. This application was specifically limited to the issue of said interference, by a disclaimer to all other subject-matter, filed Dec. 15, 1880, and hence applicant cannot now seek to avoid such disclaimer by reinstating matter so disclaimed.
3. A suit has been instituted by bill in equity, on the part of Sawyer and Man, on the patent indicated, against this applicant and upon the identical claims applicant is now seeking to inject into this application.

With reference to the first point made by the examiner, it should be stated that the issue of the interference was as follows:

"An incandescent conductor for an electric lamp 'formed of carbonized paper.'"

This was to a species of filament of carbonized paper, which is acknowledged to be vegetable fibre. On the conclusion of the interference, Sawyer and Man having established their right to this species of vegetable filament, came before the examiner with broad claims to the genus, or to a carbonized filament of vegetable fibre and were permitted — take such claims.

2674 The examiner has not examined the testimony set up by applicant and hence cannot pass upon this point, indeed, he is not called upon to do so. It is to be presumed that applicant made the strongest case he could, and that if Sawyer and Man were the first inventors of the species, they were also of the genus.

Concerning the second objection, the examiner simply calls attention to the disclaimer, which is as follows:

"It is not intended to claim anything herein shown and described except the incandes*cend*ing conductor made of paper, as all such other matters of invention as are herein shown or described are only shown as incidental to and illustrative of the manner of manufacture and use of the paper carbon, and form the subject-matter of another and separate application for a patent made by me." The examiner is at a loss to know how any one can misinterpret this language.

Now, after a period of over four years, it is sought to nullify this act, and to claim every feature shown and described.

It is respectfully submitted that an applicant should be held to his statements made deliberately and with an undoubted intent.

The third objection was not urged in the official action, but applicant was advised, verbally, that such an objection was entirely pertinent.

The examiner is advised, and has in his possession a copy of the bill in equity, filed by the Consolidated Electric Light Co., against the applicant, said bill being based upon the patent of Sawyer and Man, above referred to. The question then arises should this office be put to the expense of instituting a proceeding which will be tried elsewhere, and should parties be put to a duplicate expense for determining a single issue.

In this connection attention is called to Commissioner Marble's decision in Frazier *vs.* Nicodemus and Weeks, Commissioner's MS. Dec., vol. 23, p. 161, wherein he says:

"The motion to suspend proceedings in this case until the
2675 court is decided, which in substance involves the same issue, I think should be granted. It is unnecessary that parties should be put to the expense of taking their testimony twice to determine which is the prior inventor, and, inasmuch as that question will necessarily be determined by the court, this case should be suspended to await such determination."

This, it will be observed, was with relation to an interference already declared. It is thought that the rule should be more strongly observed concerning cases where there is no actual contest in progress.

In view of these reasons the examiner begs to submit that his course of action was entirely correct.

Respectfully submitted.

C. J. KINTNER,
Examiner Division XVI.

UNITED STATES PATENT OFFICE.

THOMAS A. EDISON, of Menlo Park, New Jersey.

Improvement in Electric Lights.

Specification forming part of Letters Patent No. 214,636, dated April 22, 1879; application filed October 14, 1878.

To all whom it may concern:

Be it known that I, Thomas A. Edison, of Menlo Park, in the State of New Jersey, have invented an improvement in electric lights, of which the following is a specification.

Electric lights have been produced by a coil or strip of platina or other metal that requires a high temperature to melt, the electric current rendering the same incandescent. In all such lights there is danger of the metal melting and destroying the apparatus, and breaking the continuity of the circuit.

My improvement is made for regulating the electric current passing through such incandescent conductor automatically, and preventing its temperature rising to the melting-point, thus producing a reliable electric light by rendering conducting substances incandescent by passing an electric current through them.

In my apparatus the heat evolved or developed is made to regulate the electric current, so that the heat cannot become too intense, because the current is lessened by the effect of the heat when certain temperatures are reached, thereby preventing injury to the incandescent substance, by keeping the heat at all times below the melting-point of the incandescent substance.

Various devices for carrying my improvement into practice may be employed, and I have tested a large number. I however have shown in the drawings my improvement in a convenient form, and contemplate obtaining separate patents hereafter for other and various details of construction, and I state my present invention to relate, broadly, to the combination with an electric light produced by incandescence, of an automatic thermal regulator for the electric current.

(Here follows diagram marked p. 2706.)

Figure 1 represents the electric-light apparatus in the form in which the thermal regulator acts by the heating effect of the current itself, and Fig. 2 illustrates the same invention when the radiated heat from the incandescent conductor operates the thermal regulator.

The incandescent metal is to be platinum, rhodium, iridium, titanium, or any other suitable conductor having a high fusing-point, and the same is used in the form of a wire or a thin plate or leaf.

I have shown the platinum wire *a* as a double spiral, the two ends terminating upon the posts *b c*, to which the conductors *d e* are connected. The double spiral *a* is free to expand or contract by the heat, as both ends are below the spiral.

A circuit-closing lever, *f*, is introduced in the electric circuit, the points of contact being at *i*, and there is a platina or similar wire, *k*, connected from the lever *f* to the head-piece or other support *l*.

The current from a magneto-electric machine, a battery, or any other source of electric energy, is connected to the binding-posts *n o*, and when contact at *i* is broken the current passes from *o* through lever *f*, wire *k*, support *l*, wire *c*, post *c*, platina coil *a*, post *b*, and wire *d*, or metallic connection, to binding-screw *n*. In this instance the wire *k*, being small, is acted upon by the electric current and heated, and by its expansion the lever *f* is allowed to close upon *i* and short-circuit the current.

The contact-point *i* is movable, and it is adjusted so that the shunt will not be closed until the temperature of the apparatus arrives at the desired height, and, by diverting a portion or the whole of the current, the temperature of the incandescent conductor is maintained in such a manner that there will be no risk of the apparatus being injured by excessive heat or the conductor fused.

If the wire *k* is small, so as to be heated by the electricity itself, it may be placed in any convenient position relatively to the light; but if such wire is heated by radiation from the electric light, then it should be adjacent to the incandescent material.

In all instances, the expansion or contraction of a suitable material under changes of temperature forms a thermostatic current-regulator that operates automatically, to prevent injury to the apparatus and to the body heated by the current.

In Fig. 2 the current does not pass through the wire *k*, and the short-circuiting lever is operated by the radiated heat expanding the wire *k*. This in practice does not operate as rapidly as the device shown in Fig. 1.

2708 The electric light may be surrounded by a glass tube or any other suitable device, such as two concentric glass tubes with the intervening space filled with alum-water or other bad conductor of heat, the object being to retain the heat of the incandescent metal and prevent loss by radiation, thus requiring less current to supply the loss by radiation.

I am aware that the electric current has been used to produce heat, and that such heat has been employed to vary the relative position of the light-giving electrodes and the length of the intervening arc. In my light there is no electric arc.

I claim as my invention—

1. In combination with an electric light having a continuous incandescent conductor, a thermostatic circuit-regulator, substantially as set forth.

2. In combination with an electric light, a thermostatically-operated shunt, substantially as set forth.

Signed by me this 5th day of October, A. D. 1878.

UNITED STATES PATENT OFFICE.

THOMAS A. EDISON, of Menlo Park, New Jersey.

Improvement in Thermal Regulators for Electric Lights.

Specification forming part of Letters Patent No. 214,637, dated April 22, 1879; application filed November 18, 1878.

To all whom it may concern:

Be it known that I, Thomas Alva Edison, of Menlo Park, in the State of New Jersey, have invented an improvement in electric lights, of which the following is a specification. (No. 162.)

The object of this invention is to devise a reliable and economical electric lamp to give light by incandescence due to the passage of the electric current through conductors of electricity, so that a great number of lamps may be used in one electric circuit.

The invention consists in causing the heat generated by the incandescent conductor to expand the air or fluid in the containing-chamber as its temperature rises, the pressure thus created serving to move outwardly a yielding material, such as a diaphragm, which, in its turn, serves to control the passage of the electric current through the incandescent body by means of contact-points or circuit-regulators, and thus the temperature of the incandescent conductor will be regulated automatically.

(Here follows diagram marked p. 2709.)

In the drawings, figure 1 is a sectional elevation of the electric lamp, and Fig. 2 is a plan of a portion of the same. The other figures are separately referred to.

a is a glass tube or vessel containing spiral or strip *c* of iridium or equivalent metal, through which the current passes. *b* is the top plate to which the spiral *c* is connected. The glass tube is secured to the metallic standard Q. *e* is a diaphragm closing the bottom of the lower chamber. There is a partition between the chamber containing the spiral *c* and the chamber of the diaphragm; but air circulates freely between the chambers through the holes *d d d d*. When the spiral is heated by the passage of the current the air in the chambers expands and bulges the diaphragm outwardly .On the center of the diaphragm is a platina point, *f*, immediately opposite another platina point, *g*, on a spring, *h*. This, again, is opposite another platina point, *n*, on the screw *m*.

m' is a disk of insulating material, on the top of which is a brass ring in electrical connection with the spring *h*. A rubbing contact-spring, *v*, connects this ring to the insulated plate R and the binding-post 2 on the base. The frame Q is connected to the other binding-post, 1. A wire, 20, connects the spiral of the light with the plate R and binding-post 2.

When no current passes in the circuit containing this instrument the air in the chamber is of the same pressure as the atmosphere, and the points *f* and *g* and *n* are not in contact. If, now, the current is allowed to circulate in the line, it passes, say, from binding-post 2 to R, thence through wire 20 to the top *b*, down through spiral *c* to base Q, to the other binding-post, 1. When the spiral *c* reaches within a few degrees of its melting-point the expansion of the air will have bulged out the diaphragm *e* and brought the points *f* and *g* together, thus short-circuiting the current from the spiral, as it now must nearly all pass from binding-post 2 to R, thence through spring *v* to the ring *y*, through spring *h* to *g*, through *f* to diaphragm *e*, to Q, and back to binding-post 1. When thus short-circuited the temperature of both the air and spiral falls by radiation, and when it reaches a certain point the diaphragm and point *f* leaves *g*, and the current again passes through *c* and raises its temperature, and the same action takes place. This regulation is so rapid that the eye does not perceive any diminution in the strength of the light. The object of the contact between *g* and *n* is that in case *f* and *g* should fail to make contact the short circuit would still take place, as *n* and *f* are both connected to Q. It is obvious that this method may be applied in many ways. For instance, the diaphragm might give motion to a lever or spring through which the contacts might be made, and this second chamber may be separated from the one containing the spiral *c*, as shown in Fig. 3. A tube, *d'*, leads from the chamber containing the spiral to the second chamber, m^2, closed by the diaphragm *e*.

n' is a lever which is moved by the movement of the diaphragm, and serves to short-circuit the spiral *c* when it comes in contact with the point *p*.

Mercury may replace air in the tube *d* and chamber m^2, the pressure of the air or gas in *a* acting through such mercury on the diaphragm *e*; or the mercury may come into contact with the point *p* to make direct circuit through the mercury.

The incandescent conductors may be made in either of the forms shown in Figs. 4, 5, or 6.

In my application No. 156, filed October 14, 1878, I have
2711 shown a thermostatic circuit-regulator in connection with the
electric light. I do not therefore herein claim any feature
set forth in said prior application.

I claim as my invention—

The method specified of regulating the temperature of the incandescent light-giving body by the expansion of the air or gas in the closed vessel containing the light, acting automatically in the electric circuit, substantially as set forth.

Signed by me this 14th day of November, A. D. 1878.

2713 UNITED STATES PATENT OFFICE.

THOMAS A. EDISON, of Menlo Park, New Jersey.

Improvement in Electric Lighting Apparatus.

Specification forming part of Letters Patent No. 218,866, dated August 26, 1879.

To all whom it may concern:

Be it known that I, Thomas Alva Edison, of Menlo Park, in State of New Jersey, have invented an improvement in electric lighting apparatus, of which the following is a specification.

In an application before filed by me, the light-giving body is combined with the circuit-connections and a thermal regulator that prevents injury to the apparatus by short-circuiting the current or placing a resistance therein. I do not therefore herein claim any such device

My present invention relates to the combination, with the light-giving body, of a range of levers and contact-surfaces arranged in such a manner that the current is short-circuited or shunted to a greater or less extent, according to the heat of the incandescent light-giving body.

(Here follows diagram marked p. 2712.)

In the drawings, figure 1 is an elevation of the bracket and a section of the light-giving apparatus. Fig. 2 is a sectional plan at the line *x x*. Figs. 3 and 4 are diagrams of the circuit-connections; and Fig. 5 is a partial elevation endwise of the shunting-levers.

The bracket *a* is sustained by a socket and pin at *b*, so that it may be swung like a gas-fixture.

c is one of the electric conductors The same is insulated and passes into an opening in the bracket, and thence to the electric light, and the return-circuit is through the pipe *a* to the wire *d*, or to the gas-pipe, if the bracket is upon a gas-pipe.

The conductor *c* passes to the insulated plate c^1 within the case *f*, and, for convenience, this case *f* has a swinging door, *f'*, in one side to give access to the interior parts. Above the case *f* is a glass cylinder, *h*, or other suitable protection for the electric light, and *i* is a strip of platina-foil or other known or desired light-giving material that can be rendered incandescent and produce the necessary light without melting. The conductor c^2 passes to one end of this light, and the other end of *i* is connected by the spring *k* with the metal part of the bracket, and thence to *d*.

The spring *k* serves to keep a slight tension on the foil *i*, and the yoke or frame *l* intervenes between the spring *k* and the foil.

There are levers *n*, or springs, that are connected at 2, and their free ends rest in and upon the yoke or frame *l*, and their ends should be tipped with platina.

The bar *o* is preferably of platina, and it is adjustable by means of the screw *m*, that raises or lowers the same, so as to bring it nearer to or farther from the ends of the levers or springs *n*. This adjustment is made so that the ends of the springs or levers *n* will not be in contact with the bar *o* while the light is in its normal condition; but when the heat of the foil *i* becomes excessive the expansion allows the ends of the springs or levers *n* to come into contact with the bar *o* and set up a shunt or short circuit from *c o*, through *n*, to *d*, and, according to the amount of expansion in *i*, so one, two, or more of the bars or springs *n* will be in contact with *o*, because said bar *o* is farther from the levers *n* at one end than at the other. By this means injury to the light-giving body is prevented, and a path established for the electric current becomes less in resistance as the points of contact between *n* and *o* increase in number.

The lower end of the yoke *l* may come into contact with the spring or stud *t* at the extreme expansive movement, as seen in Fig. 4 to still further lessen the resistance between *c* and *d* and divert the current from the foil *i*.

The ends of the levers *n* may be in a bath of mercury, as seen in Fig. 4, to insure electric contact. If the foil *i* is accidentally broken or injured the circuit through *n* is instantly closed, so that other lights in the same circuit are not extinguished. This device is automatic, so as to avoid the extinguishment of other lights.

I claim as my invention—

1. The combination, with the light-giving body, of two or more circuit levers or springs, *n*, a yoke, *l*, a contact-bar, *o*, and the circuit-connections, substantially as set forth, for lessening the resistance of the shunt as the temperature of the light-giving body increases, as specified.

2. The circuit-connection *t*, in combination with the levers or springs *n*, yoke *l*, light-giving body *i*, and circuit-connections, substantially as set forth.

Signed by me this 3d day of December, A. D. 1878.

United States Patent Office.

Thomas A. Edison, of Menlo Park, New Jersey.

Improvement in Electric Lights.

Specification forming part of Letters Patent No. 219,628, dated September 16, 1879; application filed December 9, 1878.

To all whom it may concern:

Be it known that I, Thomas Alva Edison, of Menlo Park, in the county of Middlesex and State of New Jersey, have invented an improvement in electric lights, and the following is declared to be a description of the same:

The object of this invention is to produce a candle or light-giving body by the incandescence of a conductor of electricity in the form of a cylinder, prism, or other mass of a size adapted to yield the required volume of light.

The invention consists in an electric light-giving body formed of a conductor, such as finely divided platinum, iridium, ruthinium, or other metal difficult of fusion, incorporated with non-conducting material.

The candle, made as aforesaid, can be of any desired size or shape, and the metallic particles become incandescent by the passage of the current, and the non-metallic materials are luminous and increase the brilliancy. This is accomplished by a comparatively small electric current. I mix with such finely-divided conductors infusible materials—such as oxide of magnesium or zirconium—in different proportions, so as to obtain any degrees of conductivity required.

In some instances I saturate rods, sheets, or other forms of infusible oxides with a salt of the metal difficult of fusion, and reduce the same by heat to a metallic state.

I will mention that the use of a non-conducting material is not absolutely necessary, as the finely-divided metals, owing to their porosity, have high resistance, and become easily incandescent; but I prefer to use the non-conductor.

(Here follows diagram marked p. 2714.)

In Figure 1 is shown a lamp composed of finely-divided iridium mixed with oxide of zerconium and molded in the form of a split hollow cylinder, *x*. Fig. 2 is a detached section of the same. Fig. 3 is a perspective view, and Fig. 4 is a plan view.

The cylinder being split, the current enters the binding-post A, passes through the lever L, through the regulating wire *n* to the plate *g*, thence up one side of the iridium cylinder *x*, down the other side to the plate *h*, thence, by wire *k*, to the regulating-screw *m* and binding-post *n'*.

The regulation of the temperature of the cylinder *x* is obtained by the thermal-current regulator in the same manner as is shown in my application No. 156, filed October 14, 1878.

The incandescent conductor made in this manner may be of any desired shape.

I claim as my invention—

1. For electric lighting, a conductor of electricity formed of finely-divided metal incorporated with a non-conductor of electricity, substantially as set forth.

2. A rigid electric-light-giving body having a longitudinal incision or separation from the base to near the end, for insuring the circulation of the electric current through the entire body, substantially as set forth.

3. In combination with a rigid light-giving body having a longitudinal incision, an expansive thermal-circuit regulator to control the strength of the current by the heat developed, substantially as set forth.

Signed by me this 3d day of December, A. D. 1878.

2717 UNITED STATES PATENT OFFICE.

THOMAS A. EDISON, of Menlo Park, New Jersey.

Electric Lighting Apparatus.

Specification forming part of Letters Patent No. 224,329, dated February 10, 1880. Application filed February 3, 1879.

To all whom it may concern:

Be it known that I, Thomas A. Edison, of Menlo Park, in the county of Middlesex and State of New Jersey, have invented an improvement in electric lighting apparatus, (case No. 170;) and the following is declared to be a description of the same.

The object of this invention is to produce electric illumination by the incandescence of carbon.

The invention consists in making the two poles dissimilar, one being of the carbon in the form of a slender rod, and which serves to give light, while the other is of platinum or platinum-iridium alloy, against which the rod presses. The inferiority of contact which takes place between the metal and the carbon creates a considerable resistance, which, heating the carbon, increases the inferiority of the contact, causing the carbon to become highly incandescent; but no effect is produced upon the platinum or iridium alloy.

(Here follows diagram marked p. 2716.)

In figure 1, A is the frame-work; B, the platina pole; C, the carbon rod. *h h* are springs which rub upon the carbon rod, and are the medium of conveying a current to it by the wires K from the binding-post, the platina rod B and frame A being connected to the other binding-post by the wire L. *d'* and *d* are wheels over which cords or strings are run. These strings are connected to the extreme end of the carbon C, and to the pulley *f* and weight G. The effect of the weight is to cause the carbon rod C to press at all times against the platina or iridium rod B. The carbon rod is insulated from the frame A in any suitable manner; and it will be apparent that as the carbon rod is consumed the weight G moves the carbon upwardly to maintain contact with metallic rod B.

In Fig. 2 is shown a method whereby the carbon rod C is fed downward by means of a weight, A', resting upon the upper end of the carbon and guided by the springs or rods d^2 d^3. Electrical contact is maintained with the weight and carbon by the springs d^2 d^3, or in any other suitable manner.

In Fig. 3 a magazine-lamp is shown. C C C are rods of carbon contained in the case H, which rods rest at their lower end upon the inclosed bottom of the case H, and slide toward the tube *e'*, into which the rods pass, one at a time, by their own weight. *n* is a feed-wheel that acts through an opening at one side of the tube *e'* upon the carbon rod; *p*, a weight, and *m* a spool or coil of thread or fine wire with a slight friction from a spring or otherwise to prevent the thread unwinding too easily. This thread passes around the wheel *n* or a drum on its shaft, and is constantly drawn upon by the weight *p*, so as to move the carbon rod downwardly and keep it in contact with the metal rod B.

It is obvious that a clock-work movement which will run for several days, or an electric engine included in the same circuit, may give motion to the feed-wheel *n*.

I am aware that in some instances the carbon rod has been forced into contact with a large bar tipped with platina. I make use of a rod of platina or iridium that is smaller than the carbon, so as to produce a resistance at the point of contact between the carbon and platina in consequence of the inferior contact, and thereby develop incandescence at this point. I am also aware that rods of carbon have been supplied automatically from a holder. Therefore I do not claim the same.

I claim as my invention—

1. The combination, with the carbon rod in an electric lamp, of a metal rod that is difficult of fusion and smaller than the carbon rod, so as to produce a resistance at the point of contact between the carbon and the metal, and a weight to maintain the necessary pressure at the point of contact, substantially as set forth.

2. The case H, having an inclined bottom and adapted to receive several carbon rods, in combination with the metallic rod B and means for guiding the carbon and maintaining the pressure thereof at the point of contact, substantially as set forth.

Signed by me this 23d day of January, A. D. 1879.

2719

UNITED STATES PATENT OFFICE.

THOMAS A. EDISON, of Menlo Park, New Jersey.

Electric Light.

Specification forming part of Letters Patent No. 227,227, dated May 4, 1880. Application filed February 10, 1879.

To all whom it may concern:

Be it known that I, Thomas A. Edison, of Menlo Park, in the State of New Jersey, have invented an improvement in electric lights, (case No. 171,) of which the following is a specification.

The object of this invention is to economically apply electricity to lighting, and to insure uniformity of action in the different lamps.

The invention consists, first, in an improved incandescent lamp and regulator; second, in an automatic switch connected with the regulator of the lamp to connect it with the line; third, in grouping several lamps in such a manner that their combined resistance shall be the same as one lamp.

(Here follows diagram marked p. 2718.)

Figure 1 represents the lamp and the circuit-connections. 1, 2, 3, 4, 5, and 6 are coils of wire, preferably flattened wire, formed of an alloy of platinum and iridium or metallic nickel. There are six of these coils, (see Fig. 4,) each of which is slipped over a pencil of pipe-clay, which may be provided at the top end with a head, as shown in Fig. 1. These pipe-clay pencils are secured to pipe-clay disks *x x'*, resting on the split metal cup *y y'*. Coil No. 2 has its lower end connected to the binding-screw *m* of the cup *y*. The top end of the spiral 2 connects to the spiral 3, the bottom of 3 to 4, the top of 4 to 5, the bottom of 5 to 6, the top of 6 to 1. The bottom of 1 connects to the screw *n* of the brass cup *y'*.

q and *p* are electric conductors between the divided cup *y y'* and the divided base *r* and *r'*, and at the same time serve as supports to the burner. The wire of the coils, as it comes from the winding-machine, is stretched to open the coils, and then dipped in a thick milky solution of zircon oxide and clay, and then passed through a hydrogen flame. This causes a very slight coating to adhere to the wire. The coils are pressed together and placed on the fire-clay pencils, and the coils are confined between the heads of the fire-clay pencils and the clay blocks *x x'*, into holes in which blocks the ends of such fire-clay pencils are pressed. The coils forming the spirals are thus in contact, or nearly so; but they do not connect electrically. Hence the current passes through the whole length of the wire. The expansion of the pencil of clay, or clay and zircon, is about equal to that of the metal coils. Hence their condition is not materially altered by the heat. The spirals are of such a size that they nearly touch each other. Hence the light and heat are confined within the circular range of spirals and aid in intensifying the light and heat of the electric candle, and the radiation is mostly from the outside portions of the coils. The pipe-clay disks *y y'* serve both for holding the pencils and preventing the lower ends of the spirals from cooling by having their heat conducted downward by the metal supports *q p*.

24 is a glass globe or shade set over the burner and made air-tight, or nearly so. Air can only pass through the orifice *h*, as shown by the arrow. The regulation by the electric current, and the consequent temperature of the burner, is obtained by the expansion of the air contained in the glass shade 24.

10 and 11 are flexible chambers, similar to those used in an aneroid barometer. The expansion of the air by the heat of the burner causes these chambers to bulge outwardly and gives a downward motion to the lever 12, which is secured to the camber 11 at 13.

15 is a long rod, tipped with platinum.

14 is a contact-point, and the lever 17 usually rests against it; but when the heat of the burner has reached its maximum point it has expanded the air sufficiently to cause the lever 12 and point 15 to separate the lever 17 from 14 and divert the electric current from the lamp.

When the lamp is in operation the current passes from wire 50 to point 22, which is in contact with the spring 22, the regulator-screw 19 keeping 22 and 23 in contact. Thence the current passes to binding-post and lever 17, thence to contact-point 14 to *r*, through the spirals to *r'*, thence by wire 30 to the other binding-post, and out by wire 51. If, now, the temperature of the spirals becomes too great, the lever 12 and point 15 are thrown downward and the lever 17 separated from point 14, thus throwing the lamp entirely out of circuit and placing in circuit a resistance, R^3, equal to it, the object of the resistance being to prevent an excessive spark at the contact-points. I remark that if the current is accurately circulated for the lamp the resistance of R^3 may be much greater than the
2720 lamp, and such resistance may even be in the form of several spirals placed between the spirals 1, 2, 3, 4, 5, and 6. When the lever 17 is in contact with the point 15 and lever 12 the current passes by wire 50 to 23, thence through 22 to binding-post 17, thence through 15 and 12 to the coil R^3 by wire 54, thence by wire 30 to the binding-post, and out by wire 51. The block 16, upon which the lever 17 and point 14 are attached, is movable, and it is adjusted by means of the screw 19, that passes through the stationary nut 18. By moving this block 16 toward the lamp the circuit is broken to the candle and closed through 15 and 17, and in so doing the circuit from 50 is broken between the spring 22 and screw-point 23. The reverse movement causes the lamp to be automatically connected to the circuit when the regulator-screw is turned downward to light the lamp.

The parts can be so arranged that the lamp will be disconnected when it is giving a light equal to about two candle-power.

In Fig. 2 are shown switches 41 and 42, whereby the lamps may be disconnected from the circuit after being turned down, as shown in my previous application, No. 169.

It is obvious that any of the various forms of thermal circuit-regulator already described in my previous patents may be combined with the burner herein shown.

In Fig. 3 is shown the before-described lamp with mercury substituted for the aneroid chambers.

In Fig. 2, I have shown a single lamp, L, having, say, one thousand ohms resistance placed in one branch, and in another branch I have shown four electric candles or burners, L' L^2 L^3 L^4, in one lamp, the burner being in close proximity and arranged in two branch circuits, the resistance of each branch being two thousand ohms. The two branches will jointiy offer a resistance of one thousand ohms, the same as the resistance of the one lamp L. By this arrangement various numbers of lamps may be placed in branch circuits between the same main conductors, and the resistance be equal in each branch.

In my application for a patent, No. 162, I have shown a glass shade in which the air is confined and acts by its expansion upon a diaphragm to operate the electric-circuit regulator, and in my application No. 162 I have represented the confined air as acting upon a column of mercury, and in my application for a patent, No. 166, I have shown the lamp as composed of a flattened coil of wire, and in my application No. 169 I have shown a rheostat or resistance that is thrown into the circuit when the lamp is extinguished.

I claim as my invention—

1. The combination, with the electric lamp and its transparent shade, of the aneroid chambers 10 and 11 and electric-circuit regulator, substantially as set forth.

2. In an electric lamp, the combination, with a core of pipe-clay or equivalent non-conducting material, and a base of similar material, to which the core is connected, a helix of platina or equivalent material surrounding the core, and the wires of the electric circuit connected thereto, substantially as set forth.

3. In an electric lamp, a circular range of parallel devices connected alternately at top and bottom, and at the ends to the electric-conductors, substantially as set forth.

4. The combination, in an electric lamp, of the divided base r r', standards p q, divided cup y y', and a circular range of parallel helices and circuit-connections, substantially as set forth.

5. The combination, with the electric lamp and thermal circuit-regulator, of the movable block 16, levers 12 and 17, contact-points 14 15, adjusting-screw 19, rheostat R^3, and circuit connection, substantially as and for the purposes set forth.

6. The automatic switch 22 23, in combination with the screw 19, block 16, circuit-connections, thermal circuit-regulator, and electric lamp, substantially as set forth.

7. The arrangement of four electric lamps in a divided branch circuit between two main conductors, substantially as and for the purposes set forth.

Signed by me this 6th day of February, A. D. 1879.

2722 UNITED STATES PATENT OFFICE.

THOMAS A. EDISON, of Menlo Park, New Jersey.

Electric Light.

Specification forming part of Letters Patent No. 227,228, dated May 4, 1880. Application filed February 3, 1879.

To all whom it may concern:

Be it known that I, Thomas A. Edison, of Menlo Park, in the county of Middlesex and State of New Jersey, have invented an improvement in electric light (case No. 169), of which the following is a specification.

In my patents Nos. 214,636, 219,628, and 218,866 the expansion of metal under heat is availed of in regulating the electric circuit, and hence the same is disclaimed herein.

In my present electric lamp I make use of a coil of wire with a pyroinsulating material between the coils similar to that set forth in my application No. 166, which pyroinsulation is disclaimed herein; but I combine therewith a surrounding case that is rendered incandescent by the heat of the coil, and I combine with the lamp a thermal-circuit regulator arranged so that the amount of light can be varied at pleasure by an adjusting-screw that regulates the point at which the thermal regulator acts to open the electric circuit and lessen the current, so that the incandescent case can be more or less luminous.

The invention also consists in a lamp which is peculiarly adapted to use in multiple arc.

(Here follows diagram marked p. 2721.)

In the drawings, figure 1 is a diagram illustrating the connections, and Fig. 2 shows the peculiar lighting apparatus.

The magneto-electric machines may be of any suitable character and driven by power. They may be arranged between the two main conductors A B in ranges or multiple arcs of three, four, or more in each, and the connections should be made for intensity. I have represented four such magneto-electric machines, M, in each range.

A is a tube laid in the earth, and preferably of iron, and it forms, together with the earth, one-half of the circuit. Within this tube is an insulated conductor, B, preferably of a number of strands of copper twisted together in the form of a cable, one strand of the cable being dropped, say, every one hundred feet, so that at the extreme end of the circuit there shall be but a single strand. This cable is insulated from the tube by any cheap or economical insulation, such as tar or asphaltum.

A branch tube, A^2, containing a single strand from the cable, is to enter each house or building, and from the basement smaller

wires are run to the various parts of the house where the lights are required. Each lamp is to be provided with a switch, 2, so that it may be disconnected from the conducting-wires.

The electric generators at the central station are provided with constant field-of-force magnets, the helices of which are in the electric circuit; hence if all the lamps feeding from the main conductors are disconnected by their switches the circuit will be broken and no current passes through the conductors leading from the station to the lights, and the steam-engine runs lightly and with the expenditure of a very small amount of force. If now the switch of a single lamp is turned the lamp is connected to the branch wires from the main conductors, the circuit is closed, and only sufficient current passes from the central station to supply that lamp, because the external resistance determines the amount of current. In this way the current will be proportioned to the number of lamps in the circuit.

Each lamp I prefer to contain a resistance when incandescent of one thousand ohms. After the switch has been turned on so as to connect the light to the conductors the current will pass through a resistance, R. equal to the lamp; but if the thermal regulating-screw *n* be turned downward the lamp will be thrown in circuit and the current divided according to the extent to which the regulating-screw has been turned downward; if but slightly the lamp will only reach, say, a red heat, when, owing to the expansion of the regulating-rod *g*, the lamp will be thrown out of circuit and the resistance R thrown in, as the lever *x* allows the lever Q to come in contact with the point *n*, the lever *x* breaking contact with it simultaneously. As this takes place the lamp cools and the contraction of *g* places the lamp in circuit again. Thus the resistance of the lamp and its appurtenances is quite regular regardless of the degree of temperat-e or amount of light the lamp is giving out. This feature of this light is similar to that shown in my application No. 166, and therefore does not form part of the present invention.

This apparatus is not a perfect regulator, as the resistance of the incandescent conductor increases with its heat; but if in any case
it is desirable that the resistance should be practically con-
2723 stant at all temperatures the screw *n* may be arranged to
operate contact-levers, so as to decrease or increase the resistance of R when it is thrown upward or downward, several bobbins of wires being used in R, as in my application No. 146, one or more being brought into circuit by the movement of the screw *n* and its levers. By the means above described above nine-tenths of the resistance, except of the main conductors, is light-giving resistance, thus effecting great economy in current.

As before described, as the connecting of one or more lamps causes a sufficient amount of current to be developed at the central station to keep the same incandescent, it follows that if the machines at the station are arranged expressly for tension and quantity many hundreds of lamps may be placed in circuit between the main conductors, the reduction of resistance upon placing each lamp in the circuit drawing the proper quantity of current from the station; hence the greatest economy possible is obtained by causing all the resistance outside of the main conductors to be light-giving resistances.

The lamp shown in Fig. 2 consists of a bobbin of wire insulated with a pyroinsulator, such as zircon, magnesia, lime, or other compounds of high fusibility, as set forth in my application No. 166. This bobbin B′, which has preferably a resistance of one thousand ohms, is placed within a metallic case, L, which is rendered highly incandescent by the radiated heat from the bobbin. The rod *g* is insulated from the case at P, and one end of the bobbin B′ is connected by a wire to this rod, the other end of the bobbin being connected to the case L or to the wire connected to the switch 2. When the lamp is turned off the lever Q is in contact with *n* and the resistance R is in circuit; but when *n* is lowered until the lever Q comes into contact with *x* the lamp is thrown in circuit and the regulating-rod *g* allows more or less intimate contact between *n* and Q.

I will mention that the case L is not necessarily metallic, as it may be of lime or zircon.

I claim as my invention—

1. The lamp consisting of a pyroinsulated coiled wire, in combination with a surrounding case that is rendered incandescent by the radiated heat, substantially as set forth.

2. The combination, with the electric lamp, of the thermal regulator, a resistance, and an adjusting device, *n*, arranged and operating substantially as set forth.

Signed by me this 28th day of January, A. D. 1879.

2725 UNITED STATES PATENT OFFICE.

THOMAS A. EDISON, of Menlo Park, New Jersey.

Electric Light.

Specification forming part of Letters Patent No. 227,229, dated May 4, 1880; application filed April 21, 1879.

To all whom — may concern :

Be it known that I, Thomas A. Edison, of Menlo Park, in the State of New Jersey, have invented an improvement in electric lights (case No. 176), of which the following is a specification:

When platina and other metals that fuse at a high temperature are exposed to high heat and then cooled in the atmosphere they are injured, so that they are not well adapted to use in electric lights for a long period of time.

I inclose the conductor that forms the electric candle in a transparent case and heat the same gradually to expel any gases from the material of the candle. I form a vacuum in the transparent case and then seal the same hermetically, so that all injurious atmospheric influences are avoided.

The invention further consists of a vacuum receptacle made entirely of glass and sealed by melting the same in combination with an incandescent continuous conductor pyro-insulated.

The invention further consists in winding pyro-insulated wire upon a bottom of a compressed infusible substance, such as lime.

The invention further consists in placing the vacuum-bulb within another glass receptacle, also closed from the air, and employing the expansion of the air between the two receptacles due to the heat of the incandescent bobbin to produce a movement which shall disconnect the lamps from the electric circuit when its temperature is too great.

(Here follows diagram marked p. 2724.)

The drawing shows a section of the apparatus, in which B is the transparent bulb. This bulb is open at the smaller end and the burner *d* inserted, and the open end of the tube is placed in connection with a mercury vacuum-pump, the platina wires *g* and *f* passing through. The burner is connected with a battery and variable-resistance coil while the vacuum is being made. The heat of the bobbin *d* is, in the course of one hour, brought gradually from the temperature of the air to vivid incandescence. When the vacuum is considered practically perfect the open end of the tube is melted and sealed. The platina wires passing through the glass are also sealed.

Thus I am enabled to obtain a nearly-perfect vacuum, which is permanent, and at the same time give the platinum wire a new and unknown property of great value in electric lighting, which is, that a platina wire which melts in the open air at a point where it emits a light equal to four candles will, when operated upon as described, emit a light equal to twenty-five candles without fusion. The reason why the melting-point of the metal is thus raised is, that in the act of making the vacuum with the metal under heat all the gases which are contained in its pores are withdrawn, and when the receptacle is sealed cannot re-enter when cold; hence unequal and sudden expansions cannot take place and the wire is never cracked, but if left uncovered becomes as bright as the most polished silver—an appearance which cannot be given it in any other way. On the other hand, it is known that the metals of the platinum group have, in a surprising degree, the peculiar power of absorbing within their pores many volumes of gas, and it is the sudden expansion of this gas upon a sudden accession of heat that disrupts the wire and produces cracks, which extend nearly to its center when the wire is brought to moderate incandescence in the open air. These cracks set up a great resistance to the passage of the current, and at these points become abnormally heated; hence the platina wire easily melts, where as no such cracks are noticed when the wire has been operated upon in the vacuum and all its gases pumped out.

e is a cylinder, of lime, with a small spool on its extremity, on which the wire is coiled. About thirty feet of platinum or iridium wire coated with magnesia oxide is coiled upon the spool.

The wire may be of any size; but I prefer to use wire .005 of an inch in diameter, which will give a resistance when incandescent of about seven hundred and fifty ohms. By the use of such high-resistant lamps I am enabled to place a great number in multiple arc without bringing the total resistance of all the lamps to such a low point as to require a large main conductor; but, on the contrary, I am enabled to use a main conductor of very moderate dimensions.

Another important point is gained by the use of lamps of high resistance, as the resistance of the wires leading from the main conductors may be of very moderate dimensions; hence can be 2726 placed in the pipes already used for gas, and at the same time effect a great saving in the cost of wire.

Still another point gained is, that the high resistance of the lamps allows all to be placed in multiple arc, which is the only method where the maximum economy is attainable, as the lamps, when connected to the circuit, draw from the central station just sufficient current to maintain it at the proper temperature, and if by accident or want of regularity in the main current the strength of the current should increase abnormally, the excess of heat sets the thermal regulator in motion and disconnects the lamp entirely from the circuit, thus stopping all further consumption of energy until the temperature of the lamp is reduced to its normal conditions. I will state that these changes are not perceptible to the eye; hence the lamp cannot consume any more energy than that required to cause it to emit a certain light.

No loss in economy occurs by using so large a resistance, because the loss of energy is proportionate to the radiating-surface exposed to the air and its temperature, and is independent of the resistance of the wire forming such surface.

m is a lime cup, into which the small end of the vacuum-burner is held. The platina wires pass under it to the binding-posts H K.

n is the thermal regulator, operated by the expansion of the air. When the temperature of the air between the bulbs becomes too great, the diaphragm bulges outward and the point *o* separates the spring *p* from R and disconnects the lamp from the circuit, where it remains until the temperature is reduced to the normal condition.

The spark upon the point is very small, as I employ constant field-magnets at the central station; hence the powerful sparks due to the secondary current set up by the weakening of the powerful field-magnet is avoided.

I will mention that the second globe *c* might be made entirely of glass, and the aneroid-diaphragm, provided with a platina tube, be sealed in the glass, or the aneroid itself be made of glass.

I am aware that an electric lamp has been made in which glass has been combined with other substances to form a case, and that efforts have been made to keep such case air-tight; but the changes of temperature have prevented the maintenance of a vacuum or the exclusion of the atmosphere. In my improvement the chamber containing the light is made entirely of glass, and I am able to obtain and maintain a vacuum, because there is no substance joined to the glass; hence the entire chamber can be hermetically sealed and the conductors of metal passing through the glass and around which the glass is melted are so small as not to injure the glass by their expansion.

I am also aware that carbon has been heated in the presence of both liquid and gaseous materials for changing its character and adapting it to an electric light. In my present invention the gaseous materials contained in metallic wire are driven off by the action of heat evolved by an electric current while the wire is in a vacuum, so that the pores of the metal are not filled with any extraneous substance; but, on the contrary, the metal is solidified by the removal of extraneous matter and the pores closed.

In my application No. 166 I have set forth an electric lamp formed of pyro-insulated metal. I do not, therefore, claim the same herein.

I claim as my invention—

1. In an electric lamp, the combination, with a hermetically-sealed vacuum-chamber made entirely of glass, of metallic conductors passing through the glass and around which the glass is melted, and an incandescent conductor placed in the electric circuit, substantially as set forth.

2. The method herein specified of treating metallic conductors for electric lamps, consisting in inclosing the conductor in a glass case, exhausting the atmosphere from such case, heating the conductor by an electric current, and then hermetically sealing such glass case, substantially as set forth.

3. The combination, in an electric lamp, of a hermetically-sealed

vacuum-case made entirely of glass, conducting-wires passing through the glass and around which the glass is melted, and an incandescent body formed of a pyro-insulated wire and an infusible core for the same, substantially as set forth.

4. The combination of a transparent vacuum-case, a continuous conductor forming an electric candle, and a second transparent case forming a closed chamber, for the purpose set forth.

5. The combination of the conductor *d*, forming an electric candle, the transparent sealed case B, the transparent case *c* inclosing the case B, and the thermostatic regulator *n o p* R, substantially as set forth.

Signed by me this 12th day of April, A. D. 1879.

Complainant's Exhibit Edison Patent No. 238,868. April 6, 1889. H. C. M., S. E.

2729 United States Patent Office.

Thomas A. Edison, of Menlo Park, New Jersey.

Manufacture of Carbons for Incandescent Electric Lamps.

Specification forming part of Letters Patent No. 238,868, dated March 15, 1881. Application filed May 24, 1880. (No model.)

To all whom it may concern:

Be it known that I, Thomas A. Edison, of Menlo Park, in the county of Middlesex and State of New Jersey, have invented a new and useful method of manufacturing carbons for electric lamps; and I do hereby declare that the following is a full and exact description of the same, reference being had to the accompanying drawings, and to the letters of reference marked thereon.

In other applications for patents by me made has been set out the necessity, in electric lamps lighting by incandescence, of carbons of high resistance in small bulk, and of little or no tendency to disintegration upon being highly heated; and, further, that simple wood carbons of unchanged structural condition possess these qualities.

The invention in the present case relates to a method of manufacturing such carbons.

As is well known, I ordinarily use in my lamps an incandescent material of very small cross-section, often a mere filament. This necessitates a broadening or thickening at the ends, in order to 28 afford good contact with the clamps used. A block of wood is taken and cut or formed so that its center shall be a web, bounded at the sides by thicker portions. The grain of the wood is from side to side, and the thickness of the web is about the desired breadth of the carbon. From the block so fashioned pieces whose width approximates the desired thickness of the carbon are split, shaved, or cut off. These pieces are then sufficiently softened by moisture and heat so as to be bent into a circular or horseshoe or oval form, and they are retained in such shape in a proper carbonizing-flask and carbonized.

(Here follows diagram marked p. 2728.)

In the drawings, figure 2 represents a block formed as before described; Fig. 1, a piece split, cut, or shaved therefrom; and Fig. 3, the same after carbonization.

A is the web of the block, the center of the block being reduced in thickness, while the ends *a a* are left broad or thickened for fastening to the clamps. This block is split, cut, or shaved into pieces, like Fig. 2, which are then bent into shape shown in Fig. 3, or into any other desirable shape, and then carbonized while in such forms. The result is a carbon with broadened ends for clamping, unitary with itself, and which is porous, structurally unaltered, of high resistance, and with a minimum tendency to disintegration under high heat.

It is evident that the block shown in Fig. 2 could be made of disintegrated fiber, paper pulp, papier-maché, &c., by powerful pressure, and the individual carbons then cut off from such block; but in practice I so far prefer to make the block and resultant carbons of wood.

What I claim is—

1. The method of forming carbons for electric lamps, which consists in shaping a block of wood as described, then cutting, splitting, or shaving into straight pieces, adapted for simple carbons, then bending such pieces into the desired form and carbonizing in such form, substantially as described.

2. The block for the manufacture of carbons for electric lamps, consisting of the central web and thickened or broadened ends, substantially as described.

MCKEESPORT CO.

COMPLAINANT'- EXHIBIT EDISON PATENT NO. 248,417. April 6, 1889.
H. C. M., S. E.

2732 UNITED STATES PATENT OFFICE.

THOMAS A. EDISON, of Menlo Park, New Jersey, assignor to the Edison Electric Light Company, of New York, N. Y.

Manufacturing Carbons for Electric Lights.

Specification forming part of Letters Patent No. 248,417, dated October 18, 1881. Application filed June 30, 1880. (No model.)

To all whom it may concern:

Be it known that I, Thomas A. Edison, of Menlo Park, in the county of Middlesex and State of New Jersey, have invented a new and useful method of manufacturing carbons for electric lamps; and I do hereby declare that the following is a full and exact description of the same, reference being had to the accompanying drawings, and to the letters of reference marked thereon.

This invention relates to the manufacture of carbons from wood for incandescing conductors in electric lamps.

As explained in previous applications by me made for patents for inventions relating to the same subject-matter, an incandescing conductor is needed which shall be exceedingly small—in fact, a mere filament in the light-giving portion—but with ends somewhat enlarged, so as to afford a good connection for the clamps which are to support the carbons and connect them to the conductors. These incandescing conductors are made as part of an oval, and are ordinarily designated "horseshoe carbons." In the present invention a block of wood is taken and cut in a machine or lathe for turning irregular forms until its shape is that of an elongated oval, of which about one-third, including an end, is cut upon somewhat larger axes than the remainder, in order to provide for the clamps. The interior is then reamed out in a suitable machine, so that the block then resembles a series of carbon horseshoes with closed ends piled upon each other. The length of the oval is with the grain of the wood. The block is then split or sawed into very thin layers or slips, each forming ultimately one horseshoe carbon. The slips are then carbonized, preferably in a nickel flask of a description shown in a prior application. After carbonization the greater portion of the broader end of the slip is cut off, leaving the horseshoe in shape for use. This broader end, which connects what are afterward the ends of the horseshoe, may, if desired, be cut off prior to carbonization; but as this broader connecting end tends to support and keep in shape the portions afterward forming the horseshoe, it is better to leave it on until after carbonization. Either before or after carbonization, (preferably before,) and before the slips are sawed or split from the block, small holes are made in the broad end, through which pass the clamp-screws.

(Here follows diagram marked p. 2731.)

In the drawings, figure 1 is a perspective view of the block partially turned in proper shape. Fig. 2 is a front view of a carbon after carbonization. Fig. 3 is a side view of a carbon properly secured in clamps.

A is a block of wood, which, in a proper machine, is turned so that its exterior shape is that of an oval, composed of two ovals, B, C, of different axes, thereby forming a broadened portion for the clamps, the interior being reamed out to present a uniform smooth surface, F. This block, so shaped, is then split or sawed into very thin layers or slips of a thickness sufficient for one carbon horseshoe, as seen in Figs. 2 and 3. These slips are then carbonized and a portion of C broken or cut off at *c c*, as shown in dotted lines in Fig. 2.

At some stage in the process, preferably while in the shape shown in Fig. 1, holes *d d* are drilled for the reception of the screws *e*, which fasten the clamps D to the carbon.

What I claim is—

The method of forming carbons for the incandescing conductors of electric lights, consisting in cutting or turning a block of wood into the shape of an oval having a broadened portion and reaming out the central portion of such oval, then slicing the block into layers, and then carbonizing the layers, a portion of the broadened part being removed before or after carbonization, substantially as set forth.

This specification signed and witnessed this 15th day of June, 1880.

(Fourth edition.)

2734 A. D. 1878, 9th October. No. 3988.

Electric Lighting, &c.

Letters patent to St. George Lane Fox, of Telegraph street, in the city of London, for an invention of "improvements in obtaining light by electricity and in conveying, distributing, measuring, and regulating the electric current for the same and in the means or apparatus employed therein."

Provisional Specification Left by the said St. George Lane Fox at the Office of the Commissioners of Patents on the 9th October 1878.

St. George Lane Fox, of Telegraph street, in the city of London. "Improvements in obtaining light by electricity and in conveying, distributing, measuring; and regulating the electric current for the same and in the means or apparatus employed therein."

My invention consists of improvements in obtaining light by electricity and in conveying, distributing, measuring and regulating the electric current for the same and in the means or apparatus employed therein.

In order to produce a light I pass the electric current through thin leaves or foil of some suitable material for which purpose I prefer to use platinum or an alloy of platinum and iridium.

The electric lamp in which the light is produced therefore consists of two conductors insulated from one another having this leaf or foil stretched between them and in contact with each. On each side of this leaf or foil I place a sheet of transparent mica or talc to prevent as much as possible radiation of heat from the surfaces and the cooling of the leaf or foil from atmospheric action. The sheets of mica or talc can be covered with glass plates.

Instead of stretching a strip of leaf or foil between two conductors as already described I sometimes coil a long strip of foil into a kind of spiral shape having a tube of talc, glass, fire lcay steatite
2735 or lime within the spiral and one of talc or glass just covering it outside. A fine platinum wire may be used instead of a strip of foil but the foil is preferable. A chief object I wish to attain in this lamp is to prevent as much as possible the dissipation of force in the form of heat and to concentrate and intensify it in the form of light.

An increase of light is attained by increasing the width or number of strips or by diminishing their length; in the first place more volume of light will be attained, in the second the light will be intensified.

Care should be taken that the length of the strips of foil is not too short and that they should not be too fine otherwise there is a risk of fusing them. Their length and width must be fixed according to the intensity and quantity of light required and of the electro-motive force used.

The way in which I work a number of these lamps from a single source of electricity is as follows:—From one pole or electrode of the electric generator or generators proceeds a large conductor from which branch out at various points where lights are desired, smaller conductors which again may have conductors branching off from them and so on. The other pole or electrode of each electric generator is connected with the earth so that the conductor and its branches and sub-branches will be perpetually in a state of electric tension tending to develop currents in every direction to the earth. One pole of the electric lamp is connected with the earth and this may be conveniently effected by means of gas or water pipes where such exist, so that wherever the circuit is complete between the earth and any one of these branches a current of electricity will pass through the thin leaf of metal rendering it incandescent and so produce light. The method by which I measure the amount of electricity used is as follows—I shunt off from any given length of the conductor (the amount of electricity passing through which is to be ascertained) a "derived" circuit having a voltameter joined up in it. The resistance of this circuit must be very much greater than that of the length of conductor from which it has been shunted. The resistance of both voltameter and conductor being fixed the quantity of electricity passing through the voltameter will consequently bear a fixed ratio to the amount passing through the conductor. In this matter with a graduated tube the height of a column of liquid can be measured and so the quantity of electricity passed can be ascertained.

The electromotive force of the electric conducting mains should be kept as nearly as possible constant at say 100 volts or British Association units of electromotive force.

A number of plantés (lead and sulphuric acid) cells joined together in series between the main and the earth will serve as a kind of reservoir for the electricity.

The electric current may be conducted through copper conductors

which can conveniently be laid inside the existing gas pipes having insulators of earthenware or other material around them to prevent their contact with the iron pipes. The conducting mains may be formed of a number of copper bands soldered together at the joints and insulated as just described. A very high degree of insulation can be obtained by filling the annular space between the copper conductors and the iron pipes with some insulating liquid preferably petroleum rock oil. In order to keep the electro-motive force in the electric mains constant it is desirable to have in the first place several generating machines, next, it is necessary to have some regulator such as that about to be described. In my regulator I make use of what is known as the quadrant electro-meter; in this instrument the position of the suspended needle will depend on the relative electro-motive force of the so-called quadrants. By connecting this instrument with the main and the earth in the ordinary way the electro-motive force of the main will determine the position of the suspended needle. If it increase or decrease the position of the needle will be altered accordingly. Now I fit this electro-meter with small pegs so that a slight deviation of the needle one way or the other will bring it in contact with one of the pegs and thus complete a circuit and set up the electric current which acting upon an electro-magnet sets a lever or other suitable
2736 device in action. The contact with each peg forms a separate circuit acting independently on two of these levers or other devices which are in connection with steam valves, one diminishing, the other increasing the supply of steam to the engine which works the electric generators. The electro-motive force can be regulated either in this manner or by otherwise effecting the action of the electric generators through the instrumentality of the currents set up by the pegs above described so as to increase or diminish the action of the generators.

Specification in pursuance of the conditions of the letters patent filed by the said St. George Lane Fox in the Great Seal Patent Office on the 9th April, 1879.

St. George Lane Fox, of Telegraph street, in the city of London. "Improvements in obtaining light by electricity and in conveying, distributing, measuring, and regulating the electric current for the same and in the means or apparatus employed therein."

My invention consists of improvements in obtaining light by electricity and in conveying, distributing, measuring and regulating the electric current for the same and in the means or apparatus employed therein.

In order to produce a light I pass the electric current through a thin strip or wire of some suitable material for which purpose I prefer to use an alloy of platinum and iridium. The electric lamp in which the light is produced therefore consists of two conductors insulated from one another having this strip or wire between them and in contact with each.

The material or alloy employed should be capable of standing as high a degree of temperature as possible without fusing, volatilizing or falling to pieces, it should also have a high specific resistance. The higher the temperature to which the material can be raised, the more economical will be the light produced, that is the light will be greater in proportion to the force or energy expended, inasmuch as the radiant energy proceeding from the surface of the material will be more and more luminous as the temperature increases. In order to prevent the deterioration of the material when incandescent, I sometimes surround it with an atmosphere of nitrogen gas. The quantity of light will be proportional to the extent of the luminous surface. The resistance of the luminous material and its extent of surface should therefore depend on the amount of light it is required to give and the electro-motive force used. Speaking broadly it may be said that the resistance of the luminous conductor should be so adjusted or fixed that the electro-motive force of the mains to which it is attached is just sufficient to develop within it the strength of current necessary to raise it to the right degree of incandescence.

In order that the electric force may be conveyed at a high tension, that is, having high electro-motive force, so that there may not be very great loss from the resistance of the conducting mains or conductors, I make the lamps when I use an alloy of platinum and
iridium of lengths of fine wires so that I may get a high re-
2737 sistance without having a large extent of luminous surface.
I generally suspend the wire as shewn in figures 1 and 2 of the annexed drawings as I find that at a high state of incandescence the alloy becomes soft and would not retain its shape if coiled or otherwise twisted.

(Here follows diagram marked p. 2740.)

In figure 1 *a* represents the wire of alloy of platinum and iridium; it is suspended between the two conductors *b b* which pass through the top *c* of the lamp. *d* is a cover of glass or other suitable material cemented or hermetically sealed to the top *c*. In figure 2 the wire *a* is shewn as passing several times over a bar or tube *e* of glass or other insulating material the ends of the wire being attached as before to the two conductors *b b*.

The way in which I distribute the electric energy so as to work a number of these lamps from a single source of electricity is represented in the diagrams figures 3 and 5 and is as follows:—From one pole or electrode of the electric generator or generators (situated at A, figure 3) proceed one or more large conductors from which branch out at various points where lights are desired, smaller conductors which again may have conductors branching off from them and so on. The other pole or electrode of each electric generator is connected with the earth so that the conductor and its branches and sub branches will be perpetually in a state of electric tension tending to develop currents in every direction to the earth.

One pole of the electric lamp is connected with the earth *e* and this may be conveniently effected by means of gas or water pipes

where such exist so that wherever the circuit is complete between the lamp and any one of these branches a current of electricity will pass through the thin strip or wire rendering it incandescent and so produce light.

The way in which I measure the quantity of electric force or energy used is as follows:—I shunt off from any given length or resistance of the conductor (the quantity of electricity passing through which it is desired to ascertain) a "derived circuit" having an electro magnetic voltameter joined up in it; the resistance of this electro magnetic voltameter should be much greater than the portion of the conductor from which it has been shunted.

Figure 4 represents the electro magnetic voltameter. $a\ a^1$ is a portion of the conductor. $b\ b^1\ b^{11}$ is a derived circuit in which is the coil of an electro magnet *c*. In conjunction with this electro magnet is an automatic make and break piece *k*. A voltameter *v* is joined between the set screw *l* and the hammer *h* or between the points where the contact is made and broken.

The action of the apparatus is as follows:—When a current passes through the conductor $a\ a^1$ there will necessarily be a difference of electro motive force between the points *a* and a^1, the result of which will be that an electric current will be made to circulate through the coil *c* and magnetize the soft iron core. The hammer *h* which is attached to a spring will thus be drawn out of its normal position and break the contact at *k* between the set screw *l* and the hammer *h*. The hammer will then no longer be attracted and will fall back to its original position and re-establish the contact and so on. The voltameter *v* is as already stated joined up between the points of contact. The extra current formed on breaking contact will pass through the voltameter and decompose the water it contains; the quantity of water decomposed will be approximately proportional to the quantity of electricity which has passed through the conductor $a\ a^1$.

The electro-motive force of the electric conducting mains should be kept as nearly as possible constant at say 100 volts or British Association units of electro motive force.

A number of secondary batteries such as Planté's (lead and sulphuric acid) or those formed with plates of copper in a solution of bicarbonate of soda, such batteries being joined together in series between the main and the earth will serve as a kind of reservoir for the electricity. The cells should have a very large conducting surface and there should be several batteries connected up at various points of the mains so that by increasing the electro motive force during the hours when not much electricity is being
2738 used, they will become charged and the electric force will be stored up in them so that a sufficient supply will be available when the electro motive force falls owing to the draft from the mains when the force is most used and needed. The number of cells in each of these batteries will depend on the electro motive force of the mains.

Figure 5 is a diagram representing a secondary battery joined up between the main and the earth for the purpose above described. E indicates earth and *l* lamps.

The electric current may be conveyed through copper conductors which can conveniently be laid inside the existing gas pipes with insulators of earthenware or other material of annular or other suitable form around them to prevent their contact with the iron pipes. The conducting mains may be formed of a number of copper bands soldered together at the joints and insulated as just described.

I sometimes fill the space between the copper conductor and the iron pipes with some insulating liquid preferably petroleum or rock oil, by which means a very high degree of insulation can be obtained. In order to keep the electro motive force in the electric mains constant, it is desirable to have in the first place several generating machines, also a number of reservoir batteries as before explained; next it is necessary to have some regulator such as that about to be described. In my regulator I make use of what is known as the quadrant electrometer; in this instrument the position of the suspended needle will depend on the relative electro motive force of the so-called quadrants. By connecting this instrument with the main and the earth in the ordinary way the electro motive force of the main will determine the position of the suspended needle. If it increase or decrease, the position of the needle will be altered accordingly. Now I fit this electrometer with small pegs so that a slight deviation of the needle one way or the other will bring it in contact with one of these pegs and thus complete a circuit and set up the electric current which acting upon an electro magnet sets a lever or other suitable device in action. The contact with each peg forms a separate circuit acting independently on two of these levers or other devices which are in connection with steam valves, one diminishing, the other increasing the supply of steam to the engine which works the electric generators. The electro motive force can be regulated either in this manner or by otherwise effecting the action of the electric generators through the instrumentality of the currents set up by the pegs above described, so as to increase or diminish the action of the generators.

Figure 6 represents a quadrant electrometer adapted to regulating the electro motive force in the mains as just described. *a a* are the quadrants and *b* the suspended needle. *c c* are pegs of platinum or other suitable material and *d d* are springs situated between the needle *b* and these pegs. *e* is the wire connecting with the main and *f* that connecting with the earth. *g g* represent electro magnets in connection with the respective pegs *c c*, the said magnets acting on levers or other devices for operating the steam valves as above described.

And having now described the nature of my said invention and in what manner the same is to be performed I declare that I claim as my "improvements in obtaining light by electricity and in conveying distributing measuring and regulating the electric current for the same and in the means or apparatus employed therein"—

First. The mode or system hereinbefore described of distributing the electric current by mains, branches and sub-branches with returns by "earth."

Second. In combination with the said mode or system of distributing the electric current by mains branches and sub-branches with returns by "earth," I claim the production of light by the incandescence of a continuous conductor as hereinbefore described.

Third. The means or apparatus substantially as hereinbefore described with reference to figure 4 for measuring the amount of electricity passed through conductors.

Fourth. The employment as described of secondary batteries as reservoirs of electricity in combination with a mode or system of distribution such as is hereinbefore explained.

2739 Fifth. The employment of petroleum or rock oil or other suitable insulating liquid in the space between the conductors and the pipes in which they are laid, as hereinbefore described.

Sixth. Constructing apparatus substantially as hereinbefore described and represented in figure 6 for regulating the electromotive force in the mains by which the electricity is conveyed.

Seventh. The combination of the means or apparatus hereinbefore described for obtaining light by electricity and conveying distributing regulating and measuring the electric current for the same.

Eighth. Obtaining light by the incandescence of a continuous conductor as hereinbefore described and as represented in figures 1 and 2 of the annexed drawings.

Ninth. Insulating the conductors for conveying electricity for lighting purposes by means of earthenware or other insulating supports in pipes as hereinbefore described.

In witness whereof I the said St. George Lane Fox have hereunto set my hand and seal this eighth day of April, one thousand eight hundred and seventy-nine.

2742 (Third edition.)

A. D. 1878, 12th October. No. 4043.

Applying Electricity for Lighting and Heating.

Letters patent to St. George Lane Fox, of Telegraph street, in the city of London, for an invention of "improvements in the application of electricity to lighting and heating purposes and in the means or apparatus employed therein."

Provisional Specification Left by the said St. George Lane Fox at the Office of the Commissioners of Patents on the 12th October, 1878.

St. George Lane Fox, of Telegraph street, in the city of London. "Improvements in the application of electricity to lighting and heating purposes and in the means or apparatus employed therein."

In a provisional specification lodged by me on the 9th day of October 1878 (No. 3988) I stated that a chief object to be attained in lighting by electricity is to prevent as much as possible the dissipation of force in the form of heat and to concentrate and intensify it in the form of light, and I described the use of spiral strips of metal foil or wire having a tube of talc, glass, fire clay, steatite or lime within the spiral and one of talc or glass outside, the two conductors being respectively connected with the two ends of the strips—In order to increase the retention of heat I now, according to my present improvements, cover the surface of the strips with some good non heat conducting material and I use for this purpose finely divided asbestos, fire clay, lime or steatite, or even some vitreous material or a mixture of the vitreous material with one or more of the other materials, the vitreous material in the latter case serving to hold the powdered asbestos or other material on the foil. The radiation of heat from the surface would thus to a great extent be prevented. I sometimes employ asbestos itself platinized or saturated with some conducting material. The asbestos may be woven or made up in the form of paper.

In order to apply electricity to heating purposes a coil of fine wire may be used which will be heated in a greater or less degree
2743 when the electric current passes through it. The intensity
of the heat is determined by the length and thickness of the wire or foil. Platinum is well suited to the purpose but iron will answer. For heating water the wire or foil is wound or otherwise arranged at the bottom of the receptacle in which the water is contained, such receptacle being made of earthenware or other suitable material; the water becomes heated by contact with the wire or foil. For atmospheric heating the wire may either be used plain and bare or in conjunction with asbestos, fire clay, lime, or steatite. Where very high temperatures are required, such as for melting metals for example, I construct a furnace of the best non heat conducting material available, and I shape it internally to correspond with the form of the crucible to be heated. I coil or apply the heating wires or strips round the inner surface of the furnace and pass them out through the sides or bottom. The wire or strip employed as the medium for the development of heat should be much thicker at the ends in order to prevent excessive heating at the point of exit from the furnace where it should go direct to some large body of conducting material to which it must be properly secured by some metallic connection. When the crucible is inserted the whole must be covered so that the heat will be retained.

In order to regulate the electric current so as to increase or diminish the supply of heat or light I join up in circuit an instrument composed of a hollow cylinder of glass or other suitable material fixed to a metallic base; the cylinder is partly filled with mercury or other suitable liquid in which dips an adjustable rod made by preference of copper or silver; this rod is pointed and is in metallic contact with a terminal—If a current pass from this terminal to the metal base (which is in metallic contact with the other terminal) its flow can be regulated by adjusting the height of the rod so as to increase or diminish the resistance; if the rod be lowered the resistance is diminished; if it be raised the resistance is increased. The ends of the conductors used for heating or lighting should have less resistance than any other part so as to prevent overheating at the point of junction with the terminals, and this is effected by making them thicker towards the ends, the ends being led directly to a large mass of some good conducting material.

When a number of Planté's (lead and sulphuric acid) cells or batteries joined together in "series" are employed as reservoirs for the electricity as described in my former provisional specification they should have a very large surface and there should be several of them connected up at various points of the mains so that by increasing the electro motive force during the hours when not much electricity is being used they will become charged and the electric force will be stored up in them so that a sufficient supply will be available when the electro motive force falls owing to the draft from the mains when the force is most used and needed.

Or I sometimes supply each of these reservoir batteries with commutators and with the means of working them so that it will not be necessary to increase the electro motive force in the mains in order to charge them, but by merely coupling two or more parts or the whole battery for "quantity" they can be charged with a low electro motive force and be capable of giving by an alteration of the commutators the full tension when required.

2744 Specification in pursuance of the conditions of the letters patent filed by the said St. George Lane Fox in the Great Seal Patent Office on the 12th April, 1879.

St. George Lane Fox, of Telegraph street, in the city of London. "Improvements in the application of electricity to lighting and heating purposes and in the means or apparatus employed therein."

In the specification of former letters patent granted to me and dated the 9th day of October 1878 No. 3988 I described that light might be produced by passing an electric current through a thin strip or wire of some suitable material, an alloy of platinum and iridium being preferred. According to the present invention I cover the surface of the strips or wires with some suitable refractory material and I use for this purpose finely divided asbestos, fire clay, lime, magnesia or steatite, or even some vitreous material or a mixture of the vitreous material with one or more of the other materials; the vitreous material in the latter case serving to hold the powdered asbestos or other material on the foil. The object of covering the wires or strips of metal with some earthy material such as lime, magnesia, steatite &c., is that at a given temperature they seem to radiate or give off more luminous rays in proportion to the dark or non-luminous rays than does the bright metallic surface of the platinum-iridium wire at the same temperature and consequently the production of light is in this manner to a certain extent economized. I sometimes employ asbestos or other suitable non conducting refractory material saturated or impregnated with some conducting refractory material such for example as carbon or iridium. The asbestos may be woven or made up in the form of paper.

(Here follows diagram marked p. 2747.)

Figures 1 and 2 of the annexed drawings represent an electric lamp in which the luminous surface which I will term the "bridge" is made of asbestos or similar non-conducting material saturated or impregnated with some refractory conducting material such as carbon or iridium. A is the bridge held by the metallic clips B B which are attached to the conductors C C. These conductors pass through the top D of the flask E which is hermetically sealed and is filled with nitrogen gas. The luminous portion a to a^1 of the bridge is of higher resistance than the rest.

In order to apply electricity to heating purposes a coil of fine wire may be used which will be heated in a greater or less degree when the electric current passes through it. The intensity of the heat is determined by the length and thickness of the wire or foil. Platinum is well suited to the purpose but iron will answer. Or I use a larger conductor of some bad conducting refractory material, such as carbon, (preferably in the form of graphite) which in conjunction with fire clay or similar material may be made to form an inner lining of the furnace.

For heating water the wire or foil is wound or otherwise arranged at the bottom of the receptacle in which the water is contained, such receptacle being made of earthenware or other suitable material, the water becomes heated by the wire or foil. The wire or foil should of course be enameled or otherwise insulated or it may be kept apart from the water or substance to be heated by a suitable diaphragm and immersed and surrounded by some insulating fluid such as oil.

For baking, heating rooms and other atmospheric heating the wire may either be used plain and bare or in conjunction with asbestos, fire clay, lime or steatite. Where very high temperatures are required, such as for melting metals for example, I construct a furnace of the best non-heat conducting material available and I shape it internally to correspond with the form of the crucible to be heated. I coil or apply the heating conductors round the inner surface of the furnace and pass them out through the sides or bottom.

Figures 3 and 4 are respectively a vertical section and a plan with the cover removed of a furnace constructed in accordance with my invention—*a* is the body of the furnace made say of fire clay. *b* is the space or chamber for the crucible (not shewn); *c* represents the wire or strip coiled round against the sides of the
2745 chamber; the ends of these wires pass through the furnace
sides. *d* is the cover. The wire or strip *c* should be much thicker at the ends in order to prevent excessive heating at the point of exit from the furnace where it should go direct to some large body of conducting material to which it must be properly secured by some metallic connection.

Figures 5 and 6 represent respectively in vertical section and in plan (with the cover removed) a similar furnace in which the heating conductor is made of a short bad conductor and the material I prefer to employ for this conductor is a combination of plumbago with some refractory earth such as fireclay, magnesia, lime &c. The proportions of plumbago and refractory earth are fixed according to what specific resistance the compound is required to give. *a* is the body of the furnace. *b* the space or chamber for the crucible. *c* is the bad refractory conductor forming a lining of the furnace. *d* is the cover or lid. *k* is part of the conductor of comparatively low resistance and is made preferably of pure plumbago. *m m* are metallic portions of the conductor to which are attached the conducting wires P and N. The electric current passes from one conductor round both sides of the furnace to the other conductor.

It will be seen that however expensive may be the source of heat in these furnaces, there will be a great economy in its development, inasmuch as the largest part of it will be utilized; there is not as in other furnaces a constant draught through it bringing in cold and letting off heat.

By an evident modification the apparatus represented in figures 3 and 4 may be used for roasting meat and other like purposes.

In order to regulate the electric current so as to increase or diminish the supply of light or heat, I join up in circuit an instrument constructed substantially as represented in figure 7 and which I will now describe. *a* is a hollow cylinder of glass or other suitable material fixed to a metallic base *b;* it is partly filled with mercury or other suitable liquid up to about the height marked *c*. *d* is a tapered or pointed rod made by preference of copper or silver and adjustable in the cover *e;* this rod is in metallic contact with the terminal *f*. *g* is the other terminal with which the base *b* is in metallic contact.

If a current pass from the terminal *f* to the base *b* its flow can be regulated by adjusting the height of the rod *d* so as to increase or diminish the resistance; if the rod be lowered the resistance will be diminished; if it be raised the resistance is increased. By making the rod twisted or spiral as shewn in the figure it offers a higher resistance than if straight.

When a number of secondary batteries joined together in series are employed as reservoirs for the electricity in a system of distributing currents by mains, branches and sub-branches with returns by earth as described in the specification of my said former letters patent, I sometimes supply each of these reservoir batteries with commutators and with the means of working them as will be well understood so that it will not be necessary to increase the electro motive force in the mains in order to charge them, but by merely coupling two or more parts or the whole battery for quantity, they can be charged with a low electro motive force and be capable of giving by an alteration of the commutators the full tension when required.

And having now described the nature of my said invention and in what manner the same is to be performed I declare that I claim as my "improvements in the application of electricity to lighting and heating purposes and in the means or apparatus employed therein"

First. The employment for obtaining light by electricity of strips or wires covered with earthy or vitreous material as hereinbefore described.

Second. The employment for obtaining light by electricity of a continuous conductor of asbestos or other non conducting refractory material impregnated with some refractory conducting material as hereinbefore described.

Third. The means and apparatus substantially as hereinbefore described for applying electricity to heating purposes.

2746 Fourth. The instrument or apparatus constructed substantially as hereinbefore described and represented in figure 7 for regulating electric currents used for lighting or heating purposes

Fifth. The providing or fitting of commutators as hereinbefore described to secondary batteries when such batteries are employed as reservoirs of electricity in a system of distributing electric currents by mains, branches and sub-branches with returns by "earth."

In witness whereof I the said St. George Lane Fox have hereunto set my hand and seal this eighth day of April, one thousand eight hundred and seventy-nine.

Electric Lighting, &c.

Letters patent to St. George Lane Fox, of Telegraph street, in the city of London, for the invention of "improvements in the means or apparatus for obtaining light by electricity and distributing, regulating, and measuring the electric currents for the same."

Sealed the 24th January 1879, and dated the 14th November 1878.

Provisional Specification Left by the said St. George Lane Fox at the Office of the Commissioners of Patents on the 14th November, 1878.

St. George Lane Fox, of Telegraph street, in the city of London. "Improvements in the means or apparatus for obtaining light by electricity and distributing, regulating, and measuring the electric currents for the same."

My invention has reference to the application of electricity to lighting purposes.

In order to obtain light from an electric current I make use of a sheet of platinized or iridized or carbonized asbestos or other suitable material supported between two conducting terminals of platinum or other suitable material; and in order to preserve the incandescent substance in a good condition and to prevent its deterioration I enclose the whole in a glass or other suitable transparent vessel or cover through which the platinum supports are fused. This vessel or cover is then exhausted of air by means of a small tube leading from it, and it may then, if thought desirable, be filled with some gas or vapor which has no action on the material used for producing the light.

When platinum, iridium, iron, or other metal is used either pure or alloyed, with some other material or materials, and either plain or covered with some suitable material, such as powdered asbestos, magnesia, or a vitreous substance, I prefer to coil a long strip or

wire into the form of a spiral, and to attach the two ends to
2750 platinum wires fixed side by side by fusing into a piece of glass or otherwise so that they run parallel to one another, one wire carrying the top of the spiral and the other the lower end. The length and thickness of the spiral will depend on the intensity of the light required and the electro-motive force available. The ends of the spiral should be united to these wires with some hard solder. This spiral is then enclosed in a globular or flask shaped glass vessel whose neck is sufficiently large to admit it; and the neck should then be closed up around the two supporting wires so as to seal them in and make the whole vessel air tight. A small tube projecting from some part of the neck is then connected with a Sprengel air pump or other exhausting apparatus, and the air is then removed as completely as possible and the tube sealed up, some gas being previously admitted, if desired, into the vessel, as before described. The neck of the vessel may be fixed to some suitable holder or support, and the projecting platinum wires should be connected to proper terminals.

According to another method or arrangement for obtaining light by the incandescence of carbon or other suitable material the said material is enclosed, as before described, in a glass vessel from which the air is exhausted or which is filled with any suitable gas, and the terminals are, as before described, fused into the glass at the lower end of the neck where it is sealed up; or the glass vessel may be made in any way by which it can be readily opened when desired, and be again hermetically sealed; one of the terminals leads by a proper conductor to a small piece of hard coke, graphite, or other suitable material, and is fixed thereto so as to be in good electrical contact with it; this piece of carbon or material may be spherical or of other desired shape. The other terminal leads to the bottom of a long cylindrical vessel containing mercury; in the mercury is a float of some conducting material capable of vertical movement and attached to a metallic wire or rod passing through and fitting into an aperture or guide at the top of the cylindrical vessel; to this wire or guide is fixed a long pencil of carbon, about $\frac{1}{16}$th of an inch thick. This carbon being fixed to the rod of the float is pressed upwards by the buoyant action of the mercury, and the upper end of the pencil is thus pressed lightly against the lower surface of the piece of coke or other carbon or material above mentioned, so that by passing an electric current through the two terminals a brilliant light is emitted at the point of contact of the two carbons or materials. If the pencil wears away it is by virtue of the float and guide retained in the proper position, and presses with an equal pressure against the carbon or material above.

In laying on electricity to a building, district, or town for lighting purposes I arrange the conductors for the conveyance of the electricity in a manner somewhat similar to that adopted for the supply of gas, so that from the point or station where the electric currents are developed I lead a main conductor or a number of main conductors whose size should be as large as practicable in order to prevent great inequality of tension or electro-motive force

in different parts. From these main conductors branch off at different points sub-mains whose size should depend on the amount of electricity to be conveyed. One of the poles or electrodes of the electric generator or generators, and of the reservoir batteries (herein-after referred to), should be connected with the mains or branches and the opposite poles to the earth by means of gas or water pipes or otherwise. In order to prevent a great inequality in the tension or electro-motive force in different parts of the area supplied in case the main conductors are not sufficiently large, I insert at the point of junction between each branch and the main conductor a regulator, hereinafter described, whose object is to increase the resistance at the point of junction as the electro-motive force in the branch conductors rises, and so to prevent too large a current passing through those branches joining the main at points where the electro motive force is temporarily high, and to decrease the resistance when the electro motive force falls, and so to allow a constant flow in that direction. By this means although the electro-motive force in the main conductors will necessarily be
2751 & 2752 continually altering owing to the alteration of draft in different directions the electro-motive force in the branches themselves will be maintained very nearly constant. Smaller regulators may be used at the points where sub branches are led off from the main branches, and so on for the smaller branches. By this means it will be seen that by connecting the various sub branches or smaller branches at any required points with lamps an amount of electricity will pass through them according to the resistance they present to its passage.

The further control and regulation of the electro motive force can be conveniently effected by placing in conjunction with the numerous branches or different parts of the main an arrangement of secondary batteries, for which purpose I prefer to use those made with lead and sulphuric acid. In these batteries large quantities of electricity may be stored up during the time when the demand is small so as to be available for use when the demand is great. The regulator hereinbefore referred to consists of a magneto electric arrangement in which a coil of wire is placed in circuit between the branch conductor and the earth, so that more or less electricity will flow through it according as the electro motive force in the conductor is great or small. A soft iron core in the centre of this coil will consequently be magnetized in a degree proportionate to and varying with the electro motive force of the conductor at the point where the wire of the coil is connected. A spring armature working an arrangement of levers approaches or recedes from the core as the strength of its magnetism varies, so that a pointed, tapered, or conical shaped body, fixed to the end of a lever is immersed point downwards to a greater or less degree in some conducting fluid, preferably mercury, and so will alter the amount of resistance between the said pointed body and the conducting fluid; if therefore the branch through which the flow of electricity is to be regulated is connected to this mercury and the pointed body with the main, or *vice versâ*, the resistance interposed between the main and the branch conductor will be increased when the electro motive force in the branch conductor rises and diminished when it falls. The electrometer arrangement described in a provisional specification lodged by me on the 9th October, 1878, No. 3988, combined with a pointed body and conducting fluid, may be substituted for the electro magnetic arrangement just described. A similar electromagnetic arrangement may be substituted for the said electrometer apparatus, as described in my said provisional specification, for the purpose of regulating the supply of electricity according to the electro motive force, or for moving the commutator of the secondary batteries as the height of the tension requires. In the present improved arrangement the spring armature works by an arrangement of levers, an indicator moving along a scale, its position depending upon the attractive force of the electro magnet, and consequently if it be connected with the main at any point it will indicate the amount of electro motive force at that point. A sliding piece with contact pegs will allow the working of levers in connection with the commutators of the secondary batteries, or with the steam valves of the engine, which works the electric generators, as described in my said provisional specification.

For the purpose of measuring the electric current which passes through any given conductor I use an apparatus which consists chiefly of an electro magnet, the coil of which forms part of the circuit of the conductor, the amount of electricity passing through which it is desired to ascertain. In conjunction with this electro magnet is an armature attached to a spring in connection with a cone or wedge-shaped body working in a suitably shaped orifice. This orifice leads by means of a pipe to an ordinary gas meter, and thence to a reservoir or air chamber kept constantly at a certain pressure, either above or below that of the atmosphere, by means of a water air pump, a small electric pump, or other suitable means. This chamber is provided with a valve which opens when the pressure increases or decreases from a certain point. In this manner the meter has on one side a constant pressure, and on the other an inlet or outlet whose extent will depend on the position of the cone shaped body, and consequently on the distance of the
2753 armature from the magnet; when no current is passing this
valve will be completely closed; a current of a greater or less strength will cause an opening of corresponding extent, and therefore a corresponding flow of air through the meter.

Instead of a meter and air chamber arranged as before described, I sometimes employ a gas holder, so that there is a constant pressure within it. The height of the gas holder, determined by a scale at its side, will represent the amount of electricity passed.

The whole apparatus may be worked either by pressure or vacuum, and the gas meter registering the amount of air passing through it should bear a constant ratio to the amount of electricity passing round the coils of the electro-magnet.

The adjustment of this apparatus can be conveniently effected by varying the shape of the cone or wedge shaped body, or by altering the tension of the armature spring.

It may sometimes be advisable to use a shunted portion of the circuit to work this meter, so that the whole current need not pass through the coil of the electro-magnet, but a portion which bears a fixed ratio to the whole.

Although I prefer to use a gas meter so as to measure the volume of air passed through the valve, water may, if desired, be used instead of air, and the amount of water passed through the valve be made to represent the consumption of electricity in the same way as in the other case it is represented by the passage of a given quantity of air.

2754 Specification in pursuance of the conditions of the letters patent filed by the said St. George Lane Fox in the Great Seal Patent Office on the 14th May, 1879.

St. George Lane Fox, of Telegraph street, in the city of London. "Improvements in the means or apparatus for obtaining light by electricity and distributing, regulating, and measuring the electric currents for the same."

My invention has reference to the application of electricity to lighting purposes.

In order to obtain light by electricity I cause a current to pass through a resisting medium composed of some refractory material so as to render it incandescent. For this purpose I sometimes make use of some difficultly fusible metallic body such as platinum-iridium alloy in the form of a strip of wire. I prefer however to use the compound material mentioned in the specification of my patent, dated October 12th, 1878, No. 4043, and which as therein described is composed of asbestos or other suitable non-conducting refractory material such as lime, magnesia, or steatite, impregnated with or covering the surface of some refractory conducting material such as carbon, platinum, or iridium. In order to prevent the deterioration of the material it is sometimes necessary to enclose it in a glass cover filled with some gas or vapor which has no action on the incandescent material.

In laying on electricity to a building, district, or town for lighting purposes I arrange the conductors for the conveyance of the electricity as described in the specification of my patent dated October 9th, 1878, No. 3988, that is to say, in a manner somewhat similar to that adopted for the supply of gas, so that from the point or station where the electric currents are developed I lead a main conductor or a number of main conductors whose size should be as large as practicable, in order to prevent great inequality of tension or electro motive force in different parts. From these main conductors branch off at different points sub-mains, whose size should depend on the amount of electricity to be conveyed. One of the poles or electrodes of the electric generator or generators, and of the reservoir or secondary batteries (described in the specification of my said patent of 9th October 1878), should be connected with the mains or branches and the opposite poles to the earth by means of gas or water pipes or otherwise. In order to prevent a great inequality in the tension or electro motive force in different parts of the area supplied, in case the main conductors are not sufficiently large I insert at the point of junction between each branch and the main conductor (or between any two parts of the main) a regulator hereinafter described, whose object is to increase the resistance at the point of junction, as the electro motive force in the branch conductors rises, and so to prevent too large a current passing through those branches joining the main at points where the electro motive force is temporarily high, and to decrease the resistance when the electro motive force falls, and so to equalize the electro motive force in that direction. By this means, although the electro motive force in the main conductors may be continually altering, owing to the alteration of draft in different directions, the electro motive force in the branches themselves will be maintained very nearly constant.

Smaller regulators may be used at the points where sub-branches are led off from the main branches and so on for the smaller branches. By this means it will be seen that by connecting the various sub-branches or smaller branches at any required points with lamps a constant amount of electricity will pass through them according to the resistance they present to its passage.

(Here follow diagrams marked pp. 2759 & 2760.)

The regulator hereinbefore referred to should be such as that represented in figure 1. It consists of a magneto electric arrange-
2755 ment in which a coil of wire *a* is placed in circuit between the
branch conductor *b* and the earth so that more or less electricity will flow through it, according as the electro motive force in the conductor is great or small. A soft iron core in the centre of this coil *a* will consequently be magnetised in a degree proportionate to and varying with the electro motive force of the conductor at the point where the wire of the coil is connected. An armature *c*, fitted with a weight *d*, or a spring, approaches or recedes from the core as the strength of its magnetism varies so that a rheostat in connection with the armature may be made to interpose more or less resistance to the passage of the current into that part of the branch (or main) where it is desired to preserve a constant electro motive force. The rheostat is composed of a vessel *e*, containing a conducting fluid, preferably mercury, and is fixed either as shown directly to the end of the armature or with a suitable arrangement of levers between them; *f* is a resistance coil, the plates *g* of which dip into the mercury vessel *e*. It will be seen that as the mercury rises or falls with armature *c* as the electro motive force varies, there will be more or less layers of the resistance coil in circuit, thus the resistance interposed between the main and the branch conductor will be increased when the electro motive force in the branch conductor rises, and diminished when it falls. The weight *d* is carried by a bell crank centered at d^1, whose shorter arm may be made adjustable in any suitable manner.

A somewhat similar electro magnetic arrangement may be substituted for the electro-meter described in the specification of my said patent of 9th October, 1878, for the purpose of regulating the supply of electricity, according to the electro motive force or for moving the commutator of the secondary batteries as the height of the tension requires. In the present arrangement, which is represented in figure 2, the weighted or spring armature *c* works an indicator *h* moving along a scale *i*, its position depending upon the attractive force of the electro magnet *a*, and consequently if it be connected with the main at any point it will indicate the amount of electro motive force at that point. A sliding piece *k*, with platinum or other suitable contact pegs *l*, *l*, will allow or control the working through the intermediation of electro magnets *m*, *m*, of levers in connection with the commutators of the secondary batteries or with the steam valve of the engine which works the electric generators.

For the purpose of measuring the electric current which passes through any given conductor I use an apparatus which consists chiefly of an electro-magnet, the coil of which forms part of the circuit of the conductor the amount of electricity passing through which it is desired to ascertain. In conjunction with this electro magnet is an armature attached to a weight or spring in connection with a cone or wedge shaped body working in a suitably shaped orifice. This orifice leads by means of a pipe to an ordinary gas meter, and thence to a reservoir or air chamber kept constantly at a certain pressure either above or below that of the atmosphere by means of a water air pump, a small electric pump, or other suitable means. In this manner the meter has on one side a constant pressure and on the other an inlet or outlet whose extent will depend on the position of the cone shaped body, and consequently on the distance of the armature from the magnet. When no current is passing this valve will be completely closed. A current of a greater or less strength will cause an opening of corresponding extent, and therefore a corresponding flow of air through the meter.

Instead of a meter and air chamber arranged as before described I sometimes employ a gas holder having a constant pressure within it. The height of the gas holder, determined by a scale at its side, will represent the amount of electricity passed.

The whole apparatus may be worked either by pressure or vacuum, and the amount of air registered as passing through the meter should bear a constant ratio to the amount of electricity passing round the coils of the electro magnet.

The adjustment of this apparatus can be conveniently ef-
2756 fected by varying the shape of the cone or wedge shaped
body, or by altering the weight attached to the armature or
the tension of its spring.

It may sometimes be advisable to use a shunted portion of the circuit to work this meter so that the whole current need not pass through the coil of the electro magnet, but a portion which bears a fixed ratio to the whole.

Although I prefer to use a gas meter so as to measure the volume of air passed through the valve, water may if desired be used instead of air, and the amount of water passed through the valve be made to represent the consumption of electricity in the same way as in the other case it is represented by the passage of a given quantity of air.

Figure 3 represents an apparatus constructed according to my invention for measuring the electric current which passes through any given conductor. *a* is an electro magnet, the coil of which forms part of the circuit of the conductor; *b*, the amount of electricity passing through which for the supply of say a house at X it is desired to ascertain. C is an armature attached to a spring *d;* instead of this spring however I prefer to employ a weight, as in the modification shown in figures 4 and 5, and herein-after described, as I consider a weight more reliable. This armature carries a cone or wedge shaped body *e* working in an orifice *f*. This orifice leads by a pipe *g* to a meter *h* like an ordinary gas meter, and thence by a pipe *i* to an air chamber *k*. The air in this chamber is kept constantly at a certain pressure, and this may be conveniently effected by means of a water air pump, as shown, that is to say, water from a reservoir *l* in descending by the pipe *m* draws in air by the inlet *n* and carries it with it into the chamber *k; o* is the water outlet pipe; *p* is a valve to the chamber *k*, which valve opens when the pressure increases beyond a certain point. Thus the meter *h* has on one side a constant pressure and on the other side an outlet at *f* whose extent depends upon the position of the cone *c*, and therefore upon the distance of the armature *c* from the magnet *a*. As has been before explained, when no current is passing the cone *e* closes the orifice *f*, and when a current of a greater or less strength is passing the orifice *f* is opened to a corresponding extent, and consequently air to a like corresponding extent flows through the meter *h*. Figure 3, which I have just described, is only a diagram of the apparatus; its construction will be fully understood on reference to figures 4 and 5, which represent in front and side elevations respectively (figure 5 being partly in section) a modified arrangement of the apparatus in which the air chamber is kept charged by means of an electric air pump, and in which a governor is interposed between the meter and the outlet valve or orifice. In figures 4 and 5 *a* is the electro magnet whose coil forms part of the conductor *b*, the amount of electricity passed through which it is desired to ascertain. *c* is the armature fitted with a weight *d*. This weight is carried on one arm of a bell crank d^1 d^1, centred at d^2, and the other arm of the bell crank is connected by a link d^3 to the armature. *e* is the cone or valve, which may either be attached to the armature or simply rest thereon. *f* is the orifice in which the valve or cone *e* works. This orifice leads by a pipe *g* to a governor *p*, which I prefer to be what is known as a double dry gas governor, thence by a pipe *q* to the meter *h*, and from the meter by a pipe *i* to an air chamber *k*. This air chamber is kept charged by means of an electric air pump, and this is effected as follows:—*r* is an electro magnet, and *s* its armature, which is carried by a lever *t* centered at *u*. When the armature *s* is attracted by the magnet the outer end of the lever *t* presses upon and pushes down a rod *v* which

is attached to a plunger in a mercury vessel w, the result of which movement is that the mercury is forced up in a vessel x which is in communication with the vessel w. This vessel x is closed except to an air inlet pipe y, and to an air outlet pipe z which communicates with ths air chamber k. The rising of the mercury in the vessel x as above stated drives a corresponding volume of air up the pipe z to the air chamber, and the return of air from the chamber is prevented by a suitable valve fitted in the pipe z. When the armature s ceases to be attracted by the magnet the mercury which has been previously forced from the vessel w to the vessel x returns, air
2757 entering the vessel x by the pipe y which has a valve opening inwards, and the plunger in the vessel w therefore rises and lifts the armature s until it is again attracted by its magnet; a pumping action is thus kept up. Instead of having mercury in the vessel w and a plunger to act upon it, the vessel w may simply contain air, and the rod v be made to act upon a flexible diaphragm in the vessel so as to compress the air below such diaphragm, and the rod v is in this case lifted by a suitable spring. The air chamber k contains a given quantity of paraffin oil or other suitable liquid into which a pipe k^1 from an upper chamber k^2 dips, so that as the air is more or less compressed in the chamber k, the liquid is more or less forced up the pipe k^1 into the chamber k^2 which has an aperture at the top for the admission and exit of air as necessary. In order to break the contact when the pressure in the chamber k reaches a certain point I fit to this chamber a syphon k^3 made of metal, but with a glass piece k^4 interposed. The bend of the syphon contains mercury at such a level that it makes contact between the two metal portions of the syphon except when the pressure is sufficient to force its level down into the glass portion k^4; the contact is then broken. The manner in which contact is alternately made and broken so as to enable the magnet r to alternately attract and free its armature s, and thus effect the pumping action before explained is as follows:—From the tail of the lever t is suspended by a rod t^1 a plate or piece of lead t^2 which dips in sulphuric acid or other liquid in a trough t^3. The contact of the lead t^2 with the liquid in the trough t^3 completes the electric circuit in which are the coils of the magnet r so that the armature is attracted. As the armature descends the lead t^2 is gradually lifted out of the liquid, and as soon as it is quite out of contact therewith the circuit is broken.

Although I prefer that the measuring of the electric current should be effected by causing the movement or position of the armature c of the electro magnet a to control the flow of air through a meter in the manner hereinbefore explained, the same result can be obtained by causing the movement or position of the said armature c to control a meter by mechanical means. This may be effected in the manner shown in figure 6. a is the electro magnet, as in figures 3, 4, and 5; b the conductor; c, the armature with its weight d. The lever which carries the armature c bears at its outer end upon a spindle A which is free to move vertically in a guide B, and forms a pivot for a spindle A^1 which is supported by a spring

C to keep the spindle A in contact with the armature lever. On the spindle A^1 is a disc D which is in fractional contact with another disc E, this disc E is driven by clockwork at F, and is kept against the disc D by a spring. On the spindle A^1 is also a long pinion G in gear with a wheel H, and this wheel actuates the train of wheels which constitute the meter or counting apparatus. When no current is passing through the conductor b and the armature therefore is not attracted by the magnet a, and is consequently in its highest position the disc D is exactly in the centre of the disc E, and therefore not driven thereby; but as when a current is passing through the conductor b the armature c is more or less attracted by the magnet a, the spindle A with the disc D is more or less forced down, and the disc D being thus pushed more or less from the centre of the disc E is driven at a proportionate speed and a corresponding motion is given to the wheel H and to the meter; the extent to which the meter is acted upon will thus depend upon the time the current is passing through the conductor b and to the amount of current passed during such time.

And having now described the nature of my said invention, and in what manner the same is to be performed, I declare that I claim as my "improvements in the means or apparatus for obtaining light by electricity, and distributing, regulating, and measuring the electric currents for the same,"—

First. Constructing apparatus substantially as hereinbefore described, and represented in figure 1 of the annexed drawings, for regulating the distribution of the electric currents.

2758 Second. The improved electrometer or apparatus hereinbefore described, and represented in figure 2, arranged and acting as and for the purposes explained.

Third. The construction of apparatus for measuring the electric currents passing through a conductor when such apparatus comprises an electro magnet whose coil forms part of the circuit of the conductor or a shunted portion of the circuit, and when the movement or position of the armature of such electro magnet controls the working of a meter or counting apparatus, substantially in the manner hereinbefore explained.

Lastly. I claim specially the measuring apparatus constructed and acting substantially as hereinbefore described with reference respectively to figure 3, and figures 4 and 5 of the annexed drawings.

In witness whereof, I, the said St. George Lane Fox, have hereunto set my hand and seal, this fourteenth day of May, one thousand eight hundred and seventy-nine.

Electric Light.

(This invention received provisional protection only.)

Provisional specification left by St. George Lane Fox at the office of the commissioners of patents on the 20th March, 1879.

St. George Lane Fox, of Telegraph street, in the city of London. "Improvements in the means or apparatus for obtaining light by electricity and in the manufacture of materials to be employed therein."

My invention has reference to obtaining light by the incandescence of a portion of a continuous conductor through which a current of electricity is made to pass and the improvements chiefly relate to the manufacture of the material of which such portion of the conductor as is made incandescent is composed. For the manufacture of this material I employ two highly refractory materials one of which is a conducting material such for example as plumbago and the other a non-conducting or bad conducting material such for example as magnesia, zirconia lime, steatite or earthy matter. I mix or combine these materials in such proportions as to make the whole give a specific resistance in accordance with the electro motive force employed for producing the light. Where an electro motive force of 140 volts is employed in order to produce a light somewhat equal in power to an ordinary gas jet the portion of the continuous conductor which is made incandescent and which portion I will call the "luminous bridge" should have a resistance of about 300 ohms or British Association units. To attain this high resistance and keep the bridge of small size the quantity of non-conducting material would have to be considerably in excess of the conducting material. If however a smaller electro motive force is employed the conducting power and consequently the proportion of the conducting material will have to be increased.

The manner in which I prefer to manufacture the luminous bridge is as follows:—I grind or reduce the materials to impalpable or very fine powder and then with the aid of a little moisture I unite them into a compact piece of the required form by means of powerful pressure. Sometimes I add a trace of a silicate or other fusible material for the purpose of assisting in the hardening or increasing the toughness of the combined material. Sometimes also I produce on the surface a very hard film of carbon and this I effect after the bridge has been made by treating it at a high temperature with a hydrocarbon, for example by raising it to an incandescent state by sending a current through it while immersed in a dense hydrocarbon. In order that the temperature of the luminous bridge may be as much as possible equal throughout I
2763 make it narrower at and near the ends than in the middle.

I connect or fit each of the ends to a piece of plumbago or other conducting material, and union to these pieces may be made at the time of moulding the luminous bridge by placing powdered plumbago in parts of the mould contiguous to the parts which receive the mixture for forming the bridge. The bridge and plumbago pieces form what I may call an electric candle and are held in any suitable holder or holders. According to one method the plumbago pieces are held by iron or other metallic clips to which fine conducting wires are connected; according to another method the said pieces are held loosely in metallic supports having sufficient elasticity to allow of the insertion of the candle between them, electrical contact being formed by the pressure between the plumbago pieces and the metallic supports, due to the weight of the candle. According to a third method the said pieces enter passages in a block of steatite, adamant or other suitable material in which they are connected with the wires of the continuous conductor; and in order to increase the conductivity and to enable the plumbago to be soldered to the conducting wires it may be coated with copper or other metal.

The parts before described are hermetically enclosed within a globe or other form of glass or other suitable material through one portion of which the conducting wires are hermetically carried. From this globe all trace of oxygen, carbonic acid gas, water and any gas or vapor capable of attacking or affecting the material of the luminous bridge when at a high temperature must be removed.

CONSOLIDATED
vs.
MCKEESPORT.

COMPLAINANT'S EXHIBIT SOAPSTONE SWITCH PATENT. W. T. F., S. E. March 28, 1889.

UNITED STATES PATENT OFFICE.

WILLIAM E. SAWYER, of New York, and ALBON MAN, of Brooklyn, N. Y., assignors to Electro Dynamic Light Company.

Electric Switch.

Specification forming part of Letters Patent No. 229,476, dated June 29, 1880. Application filed December 5, 1878.

To all whom it may concern:

Be it known that we, William Edward Sawyer, of the city, county, and State of New York, and Albon Man, of Brooklyn, county of Kings, and State aforesaid, have jointly invented certain new and useful improvements in electric switches for dividing and regulating the application of electric currents to electric lamps; and we do hereby declare the following to be a description of our invention, and of the manner and process of making, constructing, and using the same, in such full, clear, concise, and exact terms as to enable any person skilled in the art or science to which it appertains, or with which it is most nearly connected, to make, construct, and use the same, reference being had to the accompanying drawings, making part of this specification, and to the figures and letters of reference marked thereon, and also to letters patent allowed to us for switches for electric lights, November 15, 1878.

In this switch the mode of operation in its relation to the lamp is substantially the same as that of the letters patent allowed to us as aforesaid; but this switch differs from that in its mechanical construction and in the material of which it is constructed, by which all danger or inconvenience arising from the heat of the current is avoided.

The frame of this switch is composed of soapstone or other non-conductor of heat that can be readily worked in the desired form, and instead of resistances formed of metallic conductors, as in the patent above referred to, we employ either broken or powdered carbon or carbon rods packed in tubes formed or set in the frame of the switch.

(Here follow diagrams marked pp. 2764 & 2765.)

Reference being had to the drawings, A is a disk of plaster-of-paris, soapstone, or other heat-resisting material, perforated, as shown in Fig. 6, the black circles being those which are filled with carbon, the others being for the rods and connections by which the several parts are clamped together.

On the top side of the disk are set fourteen metallic pieces, I, and on the bottom side thirteen similar pieces, J. These pieces are arranged as shown, and drawn firmly together and down upon the disk A by screw-rods I′, the position they hold with respect to each other being clearly shown in Fig. 1, wherein the full lines represent the pieces I upon the top of the disk and the dotted lines the pieces J upon the under side of the disk. The enlarged ends of the pieces I J cover the holes N O through the disk, the pieces I acting as a stopper to the upper end of the hole. The hole being packed with carbon K, Fig. 4, the plunger L is put into the lower end, and by means of screw M in pieces J the plunger L is caused to exert any required pressure upon the carbon, thus making perfect connection with the carbon and enabling its resistance to be changed, if desired.

Through hole B^2 passes a stud, B, drawn down upon the disk A by nut B′ on the under side of the disk, and turning upon this stud is a metallic disk, C, Figs. 2 and 3, through the hole B^3 of which the stud passes, the disk C being secured in place by nut B^4, Fig. 2, on the upper end of stud B.

On the disk C are two brackets, D D, drilled partly through from the under side of the disk. In the circular cavities thus made, actuated by spiral springs E′, work the two plungers E, which, as the disk is turned, make connection with the faces of the pieces I. The disk is further provided with eight pins, F, in which the pin G′ of crank-key G, working on stud H, engages, precisely the same as in the letters patent referred to. Referring to those letters patent, the current, as shown in Fig. 1, enters from the + side at the stud B, and thence through disk C and its plunger E, and when the lamp is not in circuit it passes outward by way of piece I (numbered 1) and the carbon resistance N, which has the same resistance as that of the lamp. When the lamp is fully lighted the current passes outward by way of piece I, (numbered 14,) and through the lamp.

The object of the piece P is merely to keep the plungers E from dropping out of place. Supposing the resistance of the lamp is .95 ohm, the resistance N, Fig. 6, corresponding to piece I, No. 1, of Fig. 1, is .95 ohm. When the lamp is completely out of the circuit one of the studs E is bearing upon piece I, No. 1, and the other stud E is bearing upon the blank piece P, with which there
2767 is no connection. A single turn of the crank brings the studs
upon pieces I, Nos. 2 and 8, and the current divides, three-fourths of it flowing, by way of pieces 2, carbon resistance N′, of $.31\frac{2}{3}$ ohm, piece J, and bolt I′, to piece I, No. 1, and resistance N, of .95 ohm, outward, and one-fourth of it flowing, by way of piece 8, carbon resistance O, of 1.9 ohm, and thence by piece J and bolt I′ to piece 9; thence through carbon resistance O′, of .38 ohm, and so on through carbon resistances O^2, of $.25\frac{1}{3}$ ohm, O^3, of $.18\frac{2}{21}$ ohm, O^4, of $.07\frac{5}{21}$ ohm, and O^5, of $.06\frac{1}{3}$ ohm, and thence, through piece J and bolt I′, to piece 14 and the lamp. The total resistance of the first or shunt circuit is therefore $1.26\frac{2}{3}$ ohm, and that of the lamp-circuit, including the lamp, is 3.8 ohms, making the joint resistance .95 ohm. The resistance of N^2 is $.63\frac{1}{3}$ ohm, N^3 $.63\frac{1}{3}$ ohm, N^4 $1.26\frac{2}{3}$ ohm,

N^5 3.8 ohms, and N^6 7.6 ohms, making a sum total of resistances on the shunt side of 15.2 ohms.

Without following out the various changes, which are fully set forth in the letters patent referred to, suffice it to say that when one plunger E is bearing upon piece I, No. 1, the other plunger is bearing upon blank piece P, and that the plungers thereafter take position as follows: upon 2 and 8, 3 and 9, 4 and 10, 5 and 11, 6 and 12, 7 and 13, and lastly blank piece P and 14, when the entire current is directed through the lamp.

Having thus fully described our invention, we claim and desire to secure by letters patent—

1. An electric switch consisting of a frame composed of soapstone or plaster, or other insulating material, also suitable to resist the transmission of heat, fitted with carbon resistances and combined with metal contact-joints and conductors arranged in relation to each other to regulate the application and division of the current to the lamp, as set forth, and at the same time avoid danger or inconvenience from the heat of the current.

2. A circular disk, A, fitted with packed carbon resistances, as set forth.

3. A disk, A, fitted with pieces I and J, clamped to the disk, as set forth.

2769 CONSOLIDATED E. L. CO.
vs.
MCKEESPORT CO.

COMPLAINANT'S EXHIBIT SAWYER-MAN SWITCH PATENT. W. T. F., Sp'l Ex'r. Mar. 28, 1889.

UNITED STATES PATENT OFFICE.

WILLIAM E. SAWYER, of New York, and ALBION MAN, of Brooklyn, N. Y.

Improvement in Switches for Electric Lights.

Specification forming part of Letters Patent No. 210,152, dated November 19, 1878; application filed October 19, 1878.

To all whom it may concern:

Be it known that we, William Edward Sawyer, of the city, county, and State of New York, and Albon Man, of the city of Brooklyn, in the county of Kings and State aforesaid, have jointly invented certain new and useful improvements in electrical lighting apparatus and circuits; and we do hereby declare the following to be a description of the same, and of the manner and process of making, constructing, and using them, in such full, clear, concise, and exact terms as to enable any person skilled in the art or science to which it appertains, or with which it is most nearly connected, to make, construct, and use the same, reference being had to the accompanying drawing, making part of this specification, and to certain letters patent of the United States heretofore granted to us for certain inventions hereunto appertaining, and to which especial reference will hereinafter be made.

In letters patent of the United States No. 205,303 we have shown and described an electric-lamp-lighting switch, which not only turns the current onto and off from the lamp gradually, but admits of regulating the light proceeding from the lamp to any desired intensity; and in the same letters patent we have described a distributing system, by means of which the current from a single generator may be divided among any number of lamps.

Our present invention comprises a new lamp-lighting switch which not only accomplishes the purpose of the switch above referred to, but is provided also with a safety device, the nature of which will be explained in detail hereinafter.

(Here follows diagram marked p. 2768.)

In the drawing accompanying and forming a part of this specification, figure 1 illustrates our electric-lamp-lighting switch.

Reference being had to Fig. 1, it consists of a suitable metallic holder, A, grooved so as to keep a sliding piece, B, in place. To the sliding piece B is fixed a flat spring, *b*, carrying at one end a cross-piece, *b′*, which, as the slide is moved, makes contact with the sixteen pins E E and E′ E′, arranged eight on each side of the spring.

The movement of the slide B backward and forward is accomplished by turning the crank D and D′, which works upon the stud *d*. At each revolution of the crank the pin *c*, fixed in the hub of the crank, engages with a tooth, C, and moves the slide forward one tooth, until it has acted upon the last tooth, when further movement is prevented by the contact of the cross-piece *b′* with the stop-pin *b″*. Turning the crank in the opposite direction in like manner moves the slide backward until its movement is arrested by the contact of the pin *a* with the armature-lever G.

In lighting a lamp such as that shown and described in letters patent No. 205,144, granted to us as aforesaid, we have found it important to turn on the current gradually, otherwise fractures of the carbon may ensue. It is possible that at times, when the current is fully turned on the lamp, there may occur an interruption in the supply. Extinguishment of the light follows, and the carbon grows cool. Suppose, now, that the circuit of the lamp not having been destroyed, but being set for the full force of the current, the supply is suddenly renewed, instantly the carbon is heated from a low to an extremely high temperature, and its fracture may be expected. The electro-magnet F attached to the switch effectually guards against this danger. Unless the current is circulating in its coils the lamp cannot be lighted ; and if there is an interruption in the supply the current cannot circulate in its coils, although the supply may be renewed, until the lamp shall first have been taken out of the circuit.

The armature F′ is fixed to the bent lever G, (pivoted at *e*,) one extremity of which plays between the studs *g* and *g′*, according as the magnet is or is not actuated by the current.

The spring *f* acts to force the armature away from the magnet and establish a connection between the lever G and stud *g*.

The current from the + side of the generator enters the lever G, and when the circuit is in its normal condition passes, by way of the stud *g′*, through the coils of magnet F to the holder A, then by way of slide B, spring *b*, cross-piece *b′*, and the eight pins E′, to the lamp and outward at the point. A sudden interruption
2770 occurs instantly the armature is forced away from the magnet by the spring *f*, and contact of the lever G with the stud *g* is established. The lamp is now entirely out of the circuit, and the current flows solely from the lever through stud *g* and resistance R outward at the — point. It is in this position we have shown the switch, nor can the lamp ever be relighted unless the slide B be moved back until the cross-piece *b′* makes connection with 1′ E, when the pin *a* strikes the lever G, and forces the armature within the grasp of the magnet, at the same time establishing a connection between G and *g′*. Then, if there be a supply of current, the lamp may be lighted by moving the slide B forward ; but if there be no supply, moving the slide forward will simply release the armature, and the lever G will again move to the stud *g*.

By this device even carelessness is rendered harmless, and inasmuch as seven turns of the crank are required to fully light the lamp the current is not likely ever to be turned on very rapidly.

We have found that the internal resistance of a lamp such as that of letters patent No. 205,144 is not far from six-tenths of an ohm. It is clearly important, to the end that other lamps in the circuit may not be affected, that the resistance of the circuit from + to the — points shall be constant, whether the lamp be in or out of the circuit, or whether it be lighted feebly or at its full head. Therefore when the lamp is out of the circuit—*i. e.*, the cross-piece *b′* resting upon the pins 1 1—the current flows by way of pin 1 E through the .6 ohm resistance R and outward at the — point. Thus when the lamp is entirely cut out the resistance of the circuit is precisely the same as when the lamp is fully lighted. The pins 1 E′ and 8 E serve no useful purpose other than to keep the cross-piece *b′* in position. Assuming, now, that it is desired to light the lamp, the current is let on by sevenths, but any other small fraction may be substituted. A single turn of the crank advances the cross-piece *b′* upon the two pins 2 2. The current divides, six-sevenths of it passing through resistance R′ of .1 ohm and resistance R of .6 ohm outward at the — point, the other seventh passing through the several resistance B^2, amounting altogether to 3.6 ohms, and through the lamp of .6 ohm outward at the — point. The resistance of the first circuit, which we will call the "shunt," is therefore .7 ohm, and that of the lamp is 4.2 ohms, making the resistance from the + point to the — points .6 ohm. At the next turn of the crank the cross-piece *b′* bears upon pins 3 3, and the resistance is as follows: In the shunt-circuit .84 ohm, in the lamp-circuit 2.1 = .6 ohm. Upon pins 4 4 the resistance is in the shunt-circuit 1.05, in the lamp-circuit 1.4 = .6 ohm. Upon pins 5 5 the resistance is in the shunt-circuit 1.4, in the lamp-circuit 1.5 = .6 ohm. Upon pins 6 6 the resistance is in the shunt-circuit 2.1, in the lamp-circuit .84 = .6 ohm. Upon pins 7 7 the resistance is in the shunt-circuit 4.2, in the lamp-circuit .7 = .6 ohm. Upon pins 8 8 the current no longer flows through the shunt-circuit, but is solely through the lamp, the resistance of which is .6 ohm.

By what we have written it will be seen that we not only succeed in gradually lighting the lamp to any desired degree of intensity within the scope of the current of electricity, but maintain an absolutely constant resistance in the circuit, whereby other lamps in the circuit or in other circuits are absolutely unaffected.

In the letters patent granted to us, hereinbefore referred to, we have fully set forth and claimed these important features; but we consider the switch above described an improvement upon the methods set forth in said letters patent, though we do not intend to limit our patent, of which this is a specification, to any particular form of apparatus or special application of the invention, but intend to claim all forms and applications of the invention that fall within the substance of its scope.

For distributing the current from a single generator to two or more electric lamps, engines, or other apparatus, we have recourse to a commutator in connection with the generator, which, when there are two circuits from the generator, transmits the electric impulses alternately into each, and when there are more than two circuits transmits these impulses seriatim into the several circuits. This commutator and system of distribution we intend to make the subject-matter of a separate patent.

Having thus fully described our invention, we claim and desire to secure by letters patent—

1. The combination, with an electric-lamp-lighting switch, of an apparatus which operates to prevent the completion of the lamp-circuit when there is no current to energize the lamp.

2. The combination, with an electric-lamp-lighting switch, of an apparatus energized by the current which actuates the lamp, and that operates, when there is an interruption in the flow of the current, to close the circuit of the lamp against a sudden recurrence of such flow.

3. The combination, with an electric lamp and a lamp-lighting switch, of two electrical circuits connected therewith, the switch operating to reduce the resistance of one circuit and increase the resistance of the other in such manner that at each reduction in the resistance of one circuit there will be an increase in the resistance of the other.

4. The combination of an electric lamp and a lamp-lighting switch, of electrical circuits so arranged that as the resistance in the circuit of the lamp is lessened, and consequently more current caused to flow through the lamp, the resistance of an extraneous channel or channels is increased, each reduction in the lamp-circuit being accompanied by such increase in the resistance of the
2771 extraneous channel or channels that the resistance of the main or branch circuit which contains the circuit of the lamp, and the extraneous channel or channels is maintained constant, or nearly so.

5. An electric-lamp-lighting switch or apparatus, which, after an interruption in the flow of current, operates to prevent the lighting of the lamp until it shall have first been brought into the position which it occupies when the lamp is not lighted.

vs.
MCKEESPORT CO.

COMPLAINANT'S EXHIBIT REISSUE 10134. W. T. F., Sp'l Ex'r. March 28, 1889.

UNITED STATES PATENT OFFICE.

WILLIAM E. SAWYER, of New York, and ALBON MAN, of Brooklyn, assignors to the Electro Dynamic Light Company, of New York, N. Y.

Electric Lighting System.

Specification forming part of Reissued Letters Patent No. 10134, dated June 6, 1882. Original No. 205,303, dated June 25, 1878. Application for reissue filed May 14, 1881.

To all whom it may concern:

Be it known that we, William Edward Sawyer, of the city, county, and State of New York, and Albon Man, of Brooklyn, in the county of Kings and State aforesaid, have jointly invented certain new and useful improvements in the application of electricity to electric lighting, of which the following is a description in such full, clear, concise, and exact terms as to enable any one skilled in the arts to which our invention appertains or with which it is most nearly connected to construct and practice the same, reference being had to the accompanying drawings, making part of this specification, and to the figures and letters of reference marked thereon.

(Here follow diagrams marked pp. 2772, 2773, 2774, & 2775.)

By figure 1 of the drawings is shown a general plan of the invention in its application to each lamp, including a top view of a lamp-lighter and a side view of a safety-switch. Figs. 2 and 3 are detail parts of Fig. 1. Fig. 4 is an outline of a device that may be made part of the lamp-lighter. Fig. 5 is a diagram of circuits combining several sets of apparatus shown by Fig. 1. Fig. 6 is another view of the arrangements illustrated by Fig. 1, showing its connection to a number of lamps in circuit. Fig. 7 is a side view of the cut-off or safety-switch, a top view of which is included in Fig. 6.

The operation of our invention, its object, and use are described as follows:

Referring first, for convenience of description, to Fig. 5 of the drawings, J is a generator of electricity, supplying the outletting conduits or conductors *k k*, which branch into conductors *l l* and *m m*, the continuations of which are shown only in the case of the conductors *m m*, the circuits of conductors *l l* being merely indicated in Fig. 5 by the + and — signs. There may be any number of branches *l l* and *m m* leading from the outletting-conductors, according to the volume of current supplied by the generator J. The outletting-conductors *k k*, as indicated by the thickness of the lines, are large, in order to conduct, without heating and consequent waste, the greatest quantity of current supplied.

It is clear that all of the conductors may be of uniform size; but the expense of such against conductors diminishing in transverse mass as they extend onward is so considerable that we have adopted the latter plan. Therefore we make the first section, *m m*, of the circuits smaller than the outletting-conduits, and the next sections, *o o*, Fig. 5, still smaller, and so on indefinitely. This arrangement of the conductors is the first step in the construction of the system of conductors making part of our invention; but, though desirable, it is not a necessary part of the system.

The next step is to divide and subdivide the conductors in which the lamps are placed at the point or points where the current is to be made available for lighting. This is done by making a closed offset or division in the conductor, the lamp and its machinery being placed in one side of the offset or division and a resistance in the other.

In the drawings we have shown the lamp, the lamp-lighter, and the safety-switch or cut-off of our invention placed in the offset or division *q*, the resistance R being placed in the opposite division of the branch conductors *n* and *p* between the points of division and reunion in the conductors. By these means we obtain two paths for the current in the conductor, one around and the other through the lamp and its machinery, all indicated by Q′, Fig. 5.

The next step is the arrangement of the lamp and its machinery in the divided circuit or offset *q*. This is done as follows, reference being had to Figs. 1 and 6, in which Q′ is the lamp; A D M, the lamp-lighter; U V *x y*, the safety-switch or cut-off, and R the resistance indicated in the diagram.

The letters *z z*, Figs. 5 and 6, indicate the points at which the lighting-circuits leave the branches *n* and *p* to enter the lamp and its machinery. The machinery of the lamp consists of the conductors to and about it, the lamp-lighter, by which the current is governed, and the safety-switch or cut-off, by which, in certain contingencies, the lamp is automatically cut out of circuit.

2777 The lamp-lighter consists of a flat metallic spring-lever, A, fixed to a holder, B, by means of a screw, C. This lever makes connection with the contact-point J′ when the lamp Q′ is not in circuit, and also of a lever, D, working around a pivot or stud, E, and provided with a finger-piece, D². This lever D has a cam-projection, D′, on its upper end for the purpose of lifting the spring A from contact with the point J′. The said lever has also fixed upon its short end a cogged sector, E′, the teeth of which mesh into the cog-pins G′ of pinion G, supported upon a stud, G². The object of this cogged sector and pinion is to steady the motion of the lever D by the inertia of the counter-balance or some resisting force to guard against the danger of turning the current into the lamp too rapidly. To this end the fans or arms H are fixed in the pinion to retard its motion and increase the force necessary to move the lever D. Any other means of insuring a gradual movement of the machinery will answer the purpose, and as an example we have indicated by Fig. 4 a modification that may be made in this apparatus, *a* being a tube of glass or metal, in which travels a plunger, *b*, on piston-rod *c*, provided with finger-hook *d*. The piston-rod works loosely in the tube-head *f*, and the plunger is pressed toward tube-head *e* by coil-spring *i*. In the head *e* is an opening, *g*, provided with a valve, *h*. This device may be attached to the apparatus of Fig. 1, so that, for instance, when the plunger is drawn into the position shown a catch shall take hold of the lever D, and the piston-rod being released and the valve *h* closing, the slow escape of the air as the plunger is followed by spring *i* will cause the piston-rod to slowly move the lever D and light the lamp. This piston-rod disengaging when the lamp is lighted, all that is necessary in order to put out the light is to move the lever D back to the position it occupies in Fig. 1, and this may be accomplished by a second catch upon the piston-rod *c* and the same movement of the rod as that which takes place upon lighting the lamp; but since, as before observed, any retarding device will answer the same purpose, we have not deemed it necessary to enter into details of modifications, which would only needlessly incumber our specifications; and said lamp-lighter consists also of the contact points or pieces M M M M and resistances K′, L, and O, all of which are more or less affected by the motion of the lever D.

K′ and L are resistances of, say, fifteen ohms each. P is a resistance of, say, ten ohms, and O O are five resistances of, say, two ohms each. N and N′ are stops for lever D, and M M are six metallic contact-pieces, with which the lever D makes connection as it is moved, which contact-pieces are connected, as shown, with five resistances, O O. All of these resistances may be of the character of resistance R, which, as is better shown in Fig. 2, is a flat wire or ribbon of metal. This ribbon is wound over pins T, fixed to any suitable insulating-base. The conductor of which the resistance R is made may be of any desirable form. Being in the shape of a ribbon, the conductor constituting the resistance has a large radiating-surface, and a space being left between each layer to permit of free access of air, any heat which may be evolved is rapidly dissipated.

The resistance R, Figs. 5 and 6, as it is great or small, operates to divert more or less of the current from the conductors into the set-off or division of the conductor in which the lamp and its machinery are placed.

The safety-switch is of the simplest construction. It consists of an ordinary electro-magnet, U, an ordinary armature-lever, V, a standard, W, in which the armature-lever is pivoted, and a retractile spring, V², by which the armature is held off of the magnet.

The pin V′, fixed to the lever V, serves to hold the bent lever *x*, working in the bearing *x*′, in the position shown in the drawings, Fig. 1. When, however, the lever V is attracted by magnet U, the pin V' is lifted, and the lever x, actuated by spring y, escapes from its imprisonment, as in Fig. 7.

In place of the safety-switch, we may interpose in the circuit a section of a conductor more readily fused than the conductors constituting the rest of the circuit, so that when there is too much current this section will be instantly melted and the continuity of the current destroyed.

The operation of our apparatus is as follows, reference being had to Figs. 1 and 6 of the drawings:

The current enters from the point x and divides at the point z, the required portion entering the lighting-circuit q of any one lamp, the remaining portion going through the resistance to the other lamps in circuit.

To illustrate better the operation in detail, we will follow first that portion of the current represented by the arrows S and I, Figs. 1 and 6. Assuming the lever D to be in the position shown by the drawings, the current passes from the point z, through the spring-lever A, contact-point J', resistance L, of fifteen ohms, and thence through spring y, levers x and V, standard W, and magnet U, to point z'. In this position of the lever D the lamp is not in operation, and the resistance of the circuit is fifteen ohms, disregarding everything excepting the resistance L.

To light the lamp the lever D is moved to the left, and while it is still in connection with the first contact-point, M, its end D' makes connection with spring-lever A, breaking connection between A and J', and at the same time, without breaking the current, divides it into two sub-circuits, one of which is from z to resistance K', of fifteen ohms, resistance L, of fifteen ohms, and the safety-switch to point z'; total resistance of this sub-circuit, thirty ohms. The other sub-circuit is from point z, by way of spring A, lever D, contact-point M, the five resistances O O O O O, of two ohms each, the lamp of ten ohms, and the resistance P, of ten ohms, to the point z'; total resistance of the lamp-circuit, thirty ohms. The 2778 lighting-circuit being now divided in two sub-circuits of thirty ohms resistance each, the resistance of the circuit is still fifteen ohms; but the lamp is not yet illuminated. Now, to bring the lamp up to its proper luminosity, the necessary portion of the current of the lamp-circuit must be turned into the illuminating-conductor of the lamp. This is done by turning the lever D to the left, cutting out the resistances O O O O O until the desired degree of luminosity is reached.

It will thus be seen that the lamp-lighter of our invention not only prevents the too sudden heating of the carbons, but practically obviates the disturbing influence of great changes in resistance which have heretofore accompanied the lighting or extinguishing of a lamp; and it will also appear that, inasmuch as the sub-circuits unite at K^2, the united current passes through the safety-switch to the point z' by way of the spring y, lever V, standard W, and magnet U, so that in case of an excess of current in the lamp-circuit the magnet U will be unduly energized and attract the armature, by which the lever x will be released and the circuit broken, thus cutting the lamp out of circuit; and it will be observed, also, that there is a constantly-closed shunt-circuit, c', around the lamp, so that in case the lamp-circuit be broken, or in case of an abnormally-great electrical resistance in the lamp, its machinery, or circuit, the current will be increased in the shunt c' around the lamp, leaving that particular lamp out of circuit, or to go out, without materially affecting any of the other lamps in circuit, the current being automatically transferred from the circuit B' to the shunt c' without interruption, the resistance in the shunt c' being at least equal to the resistance in the lamp-circuit B'.

It will of course be understood that to prevent the lamp from being cut out of circuit by the safety-switch U V W x y, unless the current becomes abnormally great, the retractile strength of the spring V^2 must be made equal to the attracting force of the magnet when the lamp has all the current it will bear with safety. It will also be understood that the shunt-circuit c' and the circuit B' are both closed, whether the lamp is illuminated or not, so that in case there is the least obstruction in the circuit of the lamp the current will be correspondingly increased in the shunt, leaving the circuit constant in all the other lamps. Again, if there is an excess of current it will be divided, a portion going through all the shunts and a portion through all the lamps in circuit.

In the lamp of our invention described in letters patent of the United States No. 205,144 a small piece of carbon is heated to incandescence in an atmosphere with which it will not chemically combine.

Other attempts to produce such a lamp have been made; but, among other things, it has been found almost impossible to prevent fracture of the carbon. The fracturing of the carbon is mainly due to sudden changes of temperature. While it becomes soft and pliable under the great heat of the current, at ordinary temperature it is extremely brittle, and instantaneously heating it from its normal condition to a very high temperature tends to disrupt the particles and establish the voltaic arc, by which in a moment the carbon is destroyed. Our lamp-lighter also avoids this difficulty.

To avoid undue electrical heating from accidental or other cause in the conductors, and the great resistance occasioned by the heating of a conductor, especially in the form of rheostats, we construct our artificial circuits, rheostats, or resistances R of flat or ribbon wire, in order that they may present considerable radiating-surface, and thereby keep cool when otherwise they might be melted by excessive heat.

The application of the lamp-lighter and cut-off or safety-switch to electric lamps in which the light is produced by the voltaic arc by removing resistances from the circuit or cutting lamps out of circuit in proportion as the carbons separate or the resistance becomes too great will be comprehended without further explanation.

Recurring now to Fig. 5, in which we have shown more than one branch from a single source of electricity and more than one lamp in each branch, we are aware that it is not new to place a number of lamps in series in the circuit of a generator, or to divide the current among several conductors each containing a single lamp, or to divide the current among several cross-branches each containing a single lamp. But besides other points of novelty described in this specification, it is new with us to divide the current among several conductors or several cross-branches each containing two or more lamps, as it is also new to associate each lamp with two constantly-closed circuits having an electrical resistance at least equal to the lamp or group of lamps; and it is also new to associate an automatic safety-switch or cut-off with the shunt around each lamp or group of lamps, to cut it out of circuit automatically in case of accident to the lamp or group of lamps without sensibly affecting any other lamp or group of lamps in the system, excepting that lamp or group of lamps with which the safety-switch is associated in the shunt embracing it or them; and, lest one of the principal features of our arrangement may not be apparent, we will proceed to explain the same more in detail.

It is well understood, first, that to produce a good electric light a current of electricity combining considerable quantity with considerable intensity is indispensable; second, in dividing the electric current among a large number of lamps, if there is a conductor from the generator to each lamp or a cross-branch to each lamp, the quantity of current supplied must be very great, and in the event of a short-circuit occurring in any lamps the result 2779 would be disastrous to the lamp, if it would not extinguish all the other lamps; third, in placing a large number of lamps in series, each lamp having a considerable resistance, the intensity of the current, in order to overcome the combined resistance, must be very great, and to obtain the proper intensity of current in each case is far more expensive than it is to obtain a current of great quantity with less intensity, as in the case of our invention.

To illustrate the disadvantage attending the placing of very many lamps in series, let it be assumed that there are one hundred lamps in circuit, and that the resistance of each lamp is ten ohms, then the combined resistance of all the lamps is one thousand ohms, which, in the service of current for electric lighting, is inconvenient, if not impracticable; and, moreover, if the circuit is broken in one of the lamps, the effect is to extinguish all the rest. Now, instead of placing the one hundred lamps in series, assume that there are one hundred conductors, and that in each conductor there is placed one lamp of ten ohms resistance. Then the joint resistance of the one hundred lamps will be but one-tenth of an ohm, not to mention the wear and tear upon the generator of so slight a resistance; and in case the lamp in any one of the conductors is short-circuited, so as to cut out the resistance of the lamp and its machinery, the resistance of that conductor will be *nil*, while the resistance of the other conductors having their lamps intact will remain constant. The current will then flow through the conductor of least resistance, the effect of which will be to extinguish all the other lamps in the remaining ninety-nine conductors. If to avoid this we increase the resistance of the conductors artificially or otherwise outside of the lamps, we simply waste current in overcoming the added or artificial resistance. Adopting, finally, our plans, let it be supposed that there are ten conductors or cross-branches leading from the generator, each containing ten lamps of ten ohms resistance each. The combined and joint resistance of the circuit of the generator is ten ohms, $\frac{10 \times 10}{10} = 10$. This resistance of the circuit is better suited to the generator, and should a lamp short-circuit the result would not be disastrous; on the contrary, it could hardly be detected. The very slight proportion of current taken from ninety lamps in the nine perfect conductors and the very slight proportion of current added to nine lamps in the conductor containing the short-circuiting lamp would have no appreciable effect upon either the ninety or the nine.

Referring again to the lamp-lighter, it is apparent, first, that there may be any number of resistances O in each lighter of any number of ohms or parts of ohms resistance each; second, that a portion of the current is turned out of circuit c' by turning the lever D to the extreme right; third, that in transferring the current into the circuit of the lamp the resistance of the conductor to the lamp will decrease, while the resistance in the shunt-circuit remains constant, the resistance K' becoming operative as the circuit is turned into the lamp; fourth, that everything in the lamp-lighter, excepting the bar A, lever D, resistances O O O O O, and lamp Q', may be omitted and still have an operative apparatus, since the resistances O may be increased to any extent, so that when they are all in circuit the current will be too weak to heat the carbons, while by turning them out the lamp can be illuminated to any degree of luminosity.

By Fig. 6 of the drawings is fully shown the relation and connection of the lamp-lighter, the automatic cut-off or safety-switch, the combination of conductors and circuits, and the several lamps in the circuits; and by the foregoing specification, taken in connection with the accompanying drawings, the arrangement and combination of the circuits, the construction and operation of the lamp-lighter and the automatic cut-off or safety-switch, of themselves and in relation to each other and to the circuit and lamps, will be readily understood, and by said description and drawings it will appear to any one skilled in the art or science of electricity that our invention embraces and includes the following new and useful features, parts, and combinations of parts, all of which and the object of which are described or suggested in the following claims—that is to say,

We claim—

1. In an electric lighting system, the combination of a generator of electricity which is the common source of supply for the system, two or more conductors, and two or more electric lamps in each of said conductors, or in circuits derived therefrom, substantially as described, for the purpose specified.

2. In an electric lighting system, the combination with the circuit of resistance consisting of wire having great radiating surface and having the several coils or convolutions composing the same held

apart to facilitate the access of the air and the escape of the heat, substantially as described.

3. In an electric lighting system composed of a number of lamps connected in circuit, an automatic electric safety-switch combined in the lighting-circuit of each lamp, and through which the current of said circuit flows to the other lamps in circuit, said safety-switch being connected to its own lamp and to the other lamps in circuit to disrupt the circuit of its particular lamp in case of an excess of current therein, leaving the circuit of the remaining lamps intact.

4. With each lamp-circuit B′ of an electric lighting system, the combination of a shunt, c', and an electric safety-switch, the shunt and lamp-circuit each providing a closed path for the current at the same time, one through and one around the lamp, and the safety-switch operating to cut the lamp out of circuit in case of an excess of current either in the lamp or in its shunt-circuit.

5. With the lamp-circuit, the combination of a closed shunt-
2780 circuit containing a resistance at least equal to the resistance
of the lamp, and an automatic electric safety-switch with each lamp, the shunt to furnish a path for the current in case of an abnormal resistance in the lamp, the resistance to keep the current in the lamp when the flow is normal, and the safety-switch to cut the lamp out of circuit in case of an excess of current therein.

6. In combination with a constantly-closed lamp-circuit, B′, having resistances O combined therewith, a constantly-closed shunt-circuit, c', having resistances K L, and a lighting-switch, A D, the switch coacting with the two closed circuits and the resistances thereof to gradually transfer the current from one closed circuit to the other for the purpose of gradually illuminating and extinguishing the lamp, substantially as described.

7. In an electric lighting system, a lighting-circuit conductor, n, divided at $z\ z$, between which points of divisions the lamps are placed, one branch of said divisions provided with a resistance, R, to divert the necessary current into the other divisions forming the lighting-circuit, said lighting-circuit consisting of a lamp-circuit, B′, and a shunt-circuit, c', containing a resistance at least equal to the resistance of the lamp-circuit, and combined with a lighting-switch, substantially as described.

8. In an electric lighting system, an electric lamp and a lamp-lighting switch combined in a divided conductor, forming two closed circuits, q and n or q and p, for the current at the same time, one through and one around the lamp, the lamp-circuit B′ being also provided with a shunt-circuit, c', and combined with an electric safety-switch energized by a part of the current in the system, and that cuts the lamp out when from any cause there is an excess of current in the lamp or shunt-circuit, or in both.

9. In an electric lighting system, the combination, with a main-circuit conductor, n or p, of a shunt-circuit, q, divided in two sub-circuits, B′ and c', both of which are provided with resistances, and are constantly closed for the passage of current, and with one of which the lamp is also combined.

10. In an electric lighting system, the means substantially herein

described of cutting the lamp out of circuit when from any cause there is diverted from the lighting-circuit *n* or *p* an abnormally-great current in the shunt-circuit *q*, which means consist of an electric safety-switch combined with each shunt *q* and each lamp Q′, and which is called into action to cut the lamp out of circuit by any excess of current in the shunt-circuit sufficient to increase the attracting powers of the magnet of the switch until it overcomes a given counteracting force on the armature.

11. In an electric lighting system, a lighting-circuit, *n* or *p*, in which are combined a resistance, R, and a divided shunt-circuit, B′ and *c*′, having equal resistances, and an electric lamp, Q, so that the resistance R will divert a portion of the current into each division of the shunt-circuit.

12. In an electric lighting system, a lighting-circuit in which are combined a divided shunt-circuit around the lamp, a by-circuit including the lamp, and a lighting-switch, substantially as described.

13. In an electric lighting system, a lighting-circuit in which are combined a divided shunt-circuit, an electric lamp, and a safety-switch, substantially as described.

COMPL'T'S EXHIBIT SAWYER MAN REGULATOR PATENT. W. T. F., S. E. March 28, 1889.

UNITED STATES PATENT OFFICE.

WILLIAM EDWARD SAWYER, of New York, and ALBON MAN, of Brooklyn, N. Y.

Improvement in Regulators for Electric Lights.

Specification forming part of Letters Patent No. 205,305, dated June 25, 1878; application filed May 25, 1878.

To all whom it may concern:

Be it known that we, William Edward Sawyer, of the city, county, and State of New York, and Albon Man, of the city of Brooklyn, county of Kings, and State of New York, have invented certain new and useful improvements in regulators for electric lights, of which the following is a full, clear, and exact description.

The objects of our invention are, first, to supply to an electrical circuit or circuits containing electric lamps an absolutely uniform volume of current, in order to obviate the unsteadiness which has characterized most attempts at distribution; second, to supply, automatically, only so much current as may be necessary to meet the demand, thereby insuring the economical and satisfactory operation of a distributing system; and, third, when the demand for the current is lessened or increased by the removal of lamps from or their introduction into the circuit or circuits supplied by the generator, to cut off steam from, or add steam to, the engine driving the generator, in order that there may be no waste of power when the demand for the current calls for a limited application of it merely.

(Here follows diagram marked p. 2781.)

Referring to the drawings accompanying and forming a part of this specification, figures 1 and 3 are views of our electrical regulator and circuits connected therewith, and Figs. 2 and 4 are separate views of parts thereof.

The regulator of our invention so controls the steam or other power actuating the generator of electricity that this power is increased or diminished as the demand for the current is increased or diminished; and, while we have shown the result as accomplished in one way, we do not confine ourselves to the precise apparatus and the manner of its operation shown and described.

We prefer to place a sensitive magnetic apparatus in the circuit of the generator, which, when a lamp is lighted, so to speak, au-

Albon Man

tomatically takes cognizance thereof, and supplies that quantity of steam to the engine which is necessary to drive the generator at that speed which will give the exact required volume of electricity. We may so arrange our apparatus, however, that the regulator shall start different generators or couple different parts of a single generator in circuit, as may be required to supply the current; or we may arrange the regulator to control the current by the automatic changing of resistances. We may, in fact, in many ways, naturally suggestive, vary the application of our invention; and hence we do not limit ourselves to the employment of any special form of apparatus.

Referring to the drawings, figure 1 is a side view of the primary features of the regulator.

A is a single round iron bar, held in standard B, and provided with a journal, A′, also of iron, upon which journal, driven by any power having uniformity of motion, is a pulley, C, also of iron, provided with a flange or hub, C′. The motive-power driving pulley C we have not deemed it necessary to illustrate, inasmuch as it may be in the form of a clock-work or any power whatever derived from any source whatever, the only requisite being uniformity of motion.

The pulley C is held in place by washer *c*, secured by screw *d* entering the end of journal A′. If desired, the journal A′ may be provided with a thin bushing of Babbitt or other anti-friction metal; but, as such a bushing is not essential to the practical operation of our invention, we have not shown it in the drawings.

Closing over the flange C′, but not touching it, is an iron cap, D, hollowed out, as indicated by the dotted lines, whose shaft D′ has its bearings in standard E, in which it is free to turn. In Fig. 2 these several parts are shown disconnected.

The bar A is wound with conducting-wire *a b*, in the ordinary manner, so as to render the bar an electro-magnet.

Referring to Fig. 3, in which is given a partial end view of the before-described apparatus, *e* is a metal lever let into shaft D′, the extremity of which plays between the two contacts *f* and *g*. F is a retractile spring, (or it may be a weight,) capable of any adjustment,
by means of which the lever *e*, when no counter force is ex-
2783 erted, is held in contact with standard *f*. The pulley C is re-
volved in the direction opposite to that of the retraction of spring F. The speed of its rotation may be anywhere between one hundred and two thousand five hundred revolutions per minute.

The bar A becoming a magnet by reason of the current circulating in the coils *a b* the journal A′, pulley C, and hub C′ also becomes magnetic, and the tendency of the hub C′ is to attract the cap D in the direction of rotation of the pulley C, and thus to overcome the retractile force of spring F. The spring F is so adjusted that when the required strength of current is supplied by the generator, its retracting effect is exactly balanced by the counter attraction of the revolving magnetic hub C′, and the lever *e* remains counterpoised between the two contacts *f g*, touching neither of them, which is the normal position of the lever.

Referring now to Figs. 3 and 4, G is a hollow shaft, constantly revolving in standards L L, the motive power, of any kind whatever, being applied through the pulley J. Upon the shaft G, held in position by ferrules *h h h h*, are two loose pulleys, M M′, over which pass the belts *i i′* to drum N, provided with grooves N′ N′. Belt *i* is crossed, and belt *i* is run in the ordinary manner. Thus the drum N on shaft O, whose bearings are in standards L′ L′, revolves in one direction or the other, accordingly as pulley M or pulley M′ is actuated by shaft G.

Passing loosely entirely through hollow shaft G is a second shaft, H, upon each end of which is an iron disk, K. The shaft G is slotted near the middle, and through the slot the T-shaped piece I is fixed to the inner shaft H, whereby the inner shaft is caused to rotate with shaft G. The T-shaped piece I serves to impart motion to the loose pulleys M and M′, accordingly as it is drawn to the right or to the left, by the right or left movement of the inner shaft H, and thus caused to impinge upon one pulley or the other. The iron disks K, constantly revolving, constitute the armatures of electro-magnets S and T, fixed to standards S′ and T′. They rotate before the pole ends *l* of the magnets, and are attracted to the left or to the right, accordingly as magnet S or magnet T is actuated. If to the left, the T-shaped piece I is caused to impinge upon pulley M, and the drum N revolves in one direction. If to the right, the pulley M′ is actuated, and the drum N revolves in the opposite direction.

The shaft O of drum N enters the steam-chest P on standard P′, *j* and *k* representing the pipes leading thereinto and therefrom. By the rotation of this shaft steam is let into or cut off from the engine (not shown) which drives the generator U. The valve arrangements for the letting in or cutting off of steam we have not designed to show, the same constituting no part of our invention, and steam-cut-off valves being well-known mechanical devices. We remark, however, that the shaft O may operate upon the valve or valves by means of a screw or lever movement, or rotating or sliding ports.

The apparatus, Fig. 1, being preferably delicate, and the contacts between the lever *e* and standards *f* and *g* correspondingly light, we have thought it best to resort to relay-magnets Q and R to establish the circuits of magnets S and T. The armatures *n* and *n′* are fixed to spring-levers *m* and *m′*, attached to standards Q′ and R′. When no current is circulating in the coils of the magnets Q and R, the levers *m m′* bear against the stop-standards *p p′*; but when these magnets are actuated their levers are brought into contact with standards *o o′*. The three resistances *q r s* serve to divert the required portions of the current from generator U into the several local circuits.

V, V^1, and V^2 are three switches, whose studs W, W^1, and W^2 are connected, respectively, with the electric lamps or other apparatus, X, X^1, and X^2.

The operation of our invention is as follows: The lamp X is put in circuit by switch V, (which, we remark, is not essential, as it and the lamp may both be omitted from this branch,) and the engine (not shown) which drives the generator U being set in motion, a current of electricity is generated in the circuit of the lamp X, indicated by the unbroken line, branching from the generator at the points *t u*. In this branch are the three resistances *q r s*. By means of the resistance *q* a portion of the current is diverted into the coils *a b* of magnet A, and the speed of rotation of the pulley C being independent of the speed of the engine, and a uniform motion in itself, it follows that if the retractile force of the spring F is adjusted so as to be exactly counterbalanced by the magnetic force of the hub C′ acting upon the paramagnetic cap D, the lever *e* will remain in a counterpoised position between the two contacts *f g*, touching neither of them.

Let it now be assumed that the engine increases its speed, or that from any other cause too much electricity is supplied to the circuit, the magnetic attraction of hub C′ for the cap D overbalances the retractile force of spring F, and the lever *e*, rising, makes connection with contact *g*. The current used through this connection is diverted by resistance *r*, as shown by the dotted lines, the connection of the lever *e* with contact *g* causing it to flow from one side of the resistance through the standard E, shaft D′, lever *e*, contact *g*, magnet Q, and thence to the other side of the resistance. The result is that armature-lever *m* is attracted, contact is made with standard *o*, and the current used through this connection is diverted by resistance *s*, as shown by the broken or dash lines, into magnet S. The disk-armature K of that side is attracted, and, T-piece I impinging upon pulley M, drum N is rotated in one direction, and less steam is supplied to the engine, the effect of which is to drive the generator at a reduced speed, and consequently to supply less current to the circuit.

2784 Assuming, on the other hand, that the engine decreases its speed, or that from any other cause an insufficient volume of electricity is supplied to the circuit of lamp X, the magnetic attraction of hub C′ for the cap D is overbalanced by the retractile force of spring F, and lever *e*, falling, establishes connection with contact *f*. The result is that magnet R is actuated, lever *m*′ makes contact with standard *o*′, magnet T is actuated, and, T-piece I impinging upon pulley M′, that pulley is caused to rotate with shafts G and H; and drum N turning in the direction opposite to that in the first instance, more steam is supplied to the engine, the speed of the generator U is increased, and a greater volume of electricity is supplied to the circuit.

Now let switch V^1 be moved upon its stud W^1, lamp X^1 is put in circuit. The two circuits of lamps X and X^1 being of equal resistance, but one-half as much current is now supplied to the coil *a b* as in the first instance; and hence lever *e* makes connection with contact *f*, and, through the actions before noted, more steam is supplied to the engine; and the generator U being driven at greater speed, the equipoise between the attraction of magnet A and the retraction of spring F is quickly established. The same may be said of the placing of the lamp X^2 in circuit, the division of the current lessening its force in the circuit of lamp X, and augmentation immediately following.

When the circuits are parallel circuits, as shown, and the current is divided among them, it may be preferable to arrange the drum N so as to increase the quantity of current supplied, by coupling together several generators or parts of a single generator, rather than to increase the speed of the engine.

When the lamps are arranged in series, so that the current passing into and out of one lamp enters another, and so on, the introduction of a lamp, inasmuch as it increases the resistance of the circuit, and thus renders an increase in the tension of the current necessary, should preferably have the effect of increasing the speed of the generator.

Having thus fully described our invention, what we claim as such, and desire to secure by letters patent, is—

1. In an electrical regulator, the combination of two paramagnetic parts, C′ and D, operating substantially as set forth.

2. In an electric lighting system, a generator of electricity, two or more electric lamps supplied thereby, and an independent electromagnetic switch or regulator, energized by the current from the generator, and acting automatically upon the occurrence of any change of electrical condition in the circuit or circuits supplied, to allow of a corresponding change in the quantity or intensity of the current generated.

Consolidated
vs.
McKeesport.

Compl't's Exhibit Sawyer-Man Electric Meter Patent.
W. T. F., S. E. March 28, 1889.

United States Patent Office.

William E. Sawyer, of New York, N. Y.

Improvement in Electric Meters.

Specification forming part of Letters Patent No. 210,151, dated November 19, 1878; application filed October 17, 1878.

To all whom it may concern:

Be it known that I, William Edward Sawyer, of the city, county, and State of New York, have invented a new and useful electric meter; and I do hereby declare the following to be such a description of the same, reference being had to the accompanying drawing, making part of this specification, as will enable any one skilled in the art or science to which it appertains, or with which it is most nearly connected, to make, construct, and use the invention.

In letters patent of the United States No. 191,111, heretofore granted to me as sole inventor, and in other letters patent No. 205,303, granted to me and to Albon Man, of Brooklyn, and State aforesaid, as joint inventors, certain methods of dividing the current from a single generator among two or more electric lamps, or other electrical apparatus, are fully shown and described.

The object of my present invention is to provide a meter or register of the current expended in the production of electric light as applied to an electric lamp or group of lamps, and such a device being entirely new in the arts I intend to claim it broadly, not only as a meter or register, but in its combination with an electric light; and I do not confine myself to any particular device or arrangement of parts.

The meter I prefer is one which indicates with dial-hands the current expended, in which respect the apparatus of my invention does not differ from an ordinary gas-meter; and I prefer to actuate it by electro-magnetism, although I have very fully considered apparatus for registering by marks or indentations made upon a roll of paper, and mechanism energized by the expansion of metallic conductors from electrical heading.

The best form of electric-light meter I have found to be that of a time-meter—that is to say, I prefer as a meter one which operates to record the time during which a lamp is lighted rather than the quantity of current used, since the quantity of current being easily determined the element of time is the prime factor in ascertaining the amount of current consumed. Therefore I would place in a building supplied with electric lamps a meter which should indicate exactly how many hours in a given period these lamps may be lighted—viz., a meter which, if there are ten lamps in a building, and each of them is run for ten hours, would indicate a use of one hundred hours.

It is presumable that at least as often as once a month the record will be noted, and I prefer to actuate the mechanism by an ordinary clock-work, which shall be wound up once a month, although it is clear that I may employ a clock-work actuated by the electric current which operates the lamps, and which shall never require winding up.

For the sake of simplicity, I have shown in the drawing only the salient parts of my invention, omitting the clock-work as being a well-known apparatus, and also omitting—what will naturally suggest itself—a protecting-cover and lock, to render the apparatus accessible only to the proper parties.

(Here follows diagram marked p. 2785.)

Referring now to the drawing accompanying and forming a part of this specification, D is a metallic cylinder, fixed to shaft D′, which is provided with suitable bearings, (not shown,) and rotated by the clock-work, of which the reciprocating balance-wheel A, (or it may be a pendulum,) actuated in one direction by spring B, the nature of which is so clear as to render explanation unnecessary, constitutes the governor.

The cylinder D is provided with as many metallic contact-pins, E, set spirally, as there are lamps whose operation is to be registered; and these pins, as the cylinder is rotated in the direction of the arrow, make connection when the lamps are in operation with the spring armature-levers F of electro-magnets G.

When there is no current flowing in the coils of magnets G, the levers F are forced by springs I away from the magnets to contact with the stops H, so that the pins E may pass without making connection with the levers. All of the armature-levers F work freely upon shaft J, held in appropriate standards. (Not shown.)

Running along under the outer ends of the levers F is a metal strip, K, fixed to shaft L L, which, when the magnets G are not energized, is forced upward by spiral spring P, acting against arm L′ fixed to shaft L L. To this metal strip K is fixed an arm, M, carrying a light flat spring, N, to which is fixed a bent piece, O, the object of which will soon be made apparent.

The current entering at the — point taverses a resistance, R, passes
through the several lighting apparatus of lamps 1, 2,
2787 & 2788 and 3, and thence outward at the + point. R^1 R^1 R^1
represent the lamp-lighting apparatus. (Shown in letters patent of the United States, number as aforesaid, heretofore granted to me as sole inventor, and to me and to Albon Man as joint inventors, number as aforesaid.)

The resistances R^2 R^2 R^2 serve when a lamp is lighted, to direct

INVENTOR.

W. E. Sawyer.

a portion of the current through the coils of the electro-magnets G G G, the currents being as shown by the broken lines.

To understand the operation of my invention, let it be assumed that the lamps are not actuated. The magnets G not being energized their armature-levers F are raised, and the strip K, also being raised, holds the bent piece O in the path of the bent piece C, fixed to the chronometer-balance A, and the motion of the clock-work, (not shown,) and consequently of cylinder D, is stayed. At this point a lamp is lighted; instantly one of the magnets G is energized, its armature-lever F is attracted, and, coming in contact with the strip K, the strip K is depressed, bent piece O thrown to the left, and an impetus imparted to the chronometer-balance by reason of the effort of bent piece O to disengage itself from bent piece C. The bent piece O no longer being in the path of C, the balance A begins and continues its reciprocating motion, passing from the position shown in the drawing to that in which the point C reaches the point A′, and thence back again, thus permitting the cylinder D to rotate in the direction of the arrow.

It makes no difference which of the armature-levers F is actuated; any one (or all of them together) serves to set the clock-work in motion. It will be clear that the clock-work may be kept continually in motion; but I have preferred that the clock-work shall run only so long as the lamps are run.

Let it be now assumed that the lamps are all extinguished. There being no magnet G energized, and no levers F depressing the strip K, the bent piece O drops into the path of C, which, as the balance A carries it to the left, rides over piece O by the yielding of spring N, and the motion of the clock-work is stopped.

The effect of the rotation of the cylinder D is as follows: By means of the resistance R, a portion of the current of the branch or main — +, when a pin, E, makes connection with a lever, F, as shown by the circuit of the light lines, is caused to energize an electro-magnet, S, the current passing from one side of R to the cylinder D, thence by way of a pin, E, to a lever, F, and thence by way of shaft J to the magnet S and armature to the other side of R. If but one lamp is lighted the magnet S will be energized but once in a revolution; if two are lighted it will be energized twice, and if three are lighted, three times, and so on. At each action of the magnet S its armature-lever T, pivoted at T^1, is attracted against spiral spring I^2, and by means of pawl T^2, held upward by spring T^3, causes the ratchet-wheel U to rotate one tooth. Thus if but one lamp is in operation the ratchet U will move but one tooth in one revolution of the cylinder D, and if all the lamps are in operation the ratchet will be constantly rotated by the constant vibration of armature-lever T.

The operation of the remainder of the apparatus is self-apparent, there being as many gears and pinions, hands, and dials as may be desired. The pinion V, fixed to ratchet U, actuates gear W; and pinion W′, fixed to gear W, actuates gear X. The hands Q and Q′ indicate upon the dials P P the current expended.

To properly estimate the "consumption" of current, so to speak, a lamp should be operated for a given number of hours, and the indication upon the dials noted. A single lamp operated for the same length of time will invariably present the same record, and two lamps will present a record of twice the value of one lamp, and so on, to any extent desired.

Having thus described my invention, I claim and desire to secure by letters patent—

1. In a system of two or more electric lamps or groups of lamps, an electric meter consisting of a registering apparatus and a rheotome or circuit-breaker driven by clock-work or other well known mechanical appliances, and operating to intermittently actuate the registering apparatus, when a lamp or lamps, or a group of lamps, is lighted.

2. In a system of two or more electric lamps or groups of lamps, an electric meter consisting of a registering apparatus and as many separate electric parts or apparatus connected to the lamps or groups of lamps as there are lamps or groups of lamps in circuit, each of said electrical parts or apparatus being separately connected with its respective lamp or group of lamps, and each separately actuating the register.

3. In an electric meter, the combination of two or more electromagnets, G G, and their armatures, the action of any one or more of which will start the register and denote the time any one or more lamps of a series is illuminated and the amount of current consumed in that time by each lamp.

4. In an electric meter, a separate electro-magnet, S, and its armature, by which the registering device is operated, in combination with one or more electro-magnets, G, by which the machinery of the meter is started, the two magnets to be connected, substantially as described, by which a series of electric impulses through G are successively concentrated upon S and made to register the current of each lamp in the series.

5. The combination, with two or more electric lamps or groups of lamps, of a single registering-meter, common to all of them, constructed to register for each and all of the lamps, substantially as shown and described.

2789 COMPLAINANT'S EXHIBIT SAWYER AND MAN BRITISH PATENT No. 4705 OF 1878.

A. D. 1878, 19th November. No. 4705.

Specification of Frederick John Cheesbrough.

Distributing, regulating, and applying electric currents for lighting, &c.

Printed by order of the commissioners of patents for inventions.
London: Published and sold at the commissioners of patents' sale department, 38 Cursitor street, Chancery lane, F. C. 1879. Price, 1s.

2790 A. D. 1878, 19th November. No. 4705.

Distributing, Regulating, and Applying Electric Currents for Lighting, &c.

Letters patent to Frederick John Cheesbrough, of the office for patents, 15 Water street, Liverpool, in the county of Lancaster, consulting engineer, for the invention of "An improved method or system of distributing, dividing, regulating, controlling, and measuring electric currents in the practical application of the same to electric lighting and other useful purposes." A communication from abroad by William Edward Sawyer, of New York city, county, and State, and Albon Man, of Brooklyn, county of Kings, State of New York, United States of America.

Sealed the 21st February, 1879, and dated the 19th November, 1878.

Provisional Specification Left by the said Frederick John Cheesbrough at the Office of the Commissioner of Patents on the 19th November, 1878.

Frederick John Cheesbrough, of the office for patents, 15 Water street, Liverpool, in the county of Lancaster, consulting engineer. "An improved method or system distributing, dividing, regulating, controlling, and measuring electric currents in the practical application of the same to electric lighting and other useful purposes." (A communication from abroad by William Edward Sawyer, of New York city, county, and State, and Albon Man, of Brooklyn, county of Kings, State of New York, United States of America.)

In order that this invention may be fully understood I have hereunto attached three sheets of drawings which illustrate the said invention, and in what manner the same is to be performed, reference being had to the drawings which are marked with letters and figures of reference corresponding with those in the following specification.

The object of this invention is to obtain a perfect distributing division, regulation, and mensuration of electric currents, as applied particularly to electric lighting, although the practical application of the invention is not limited to electric lighting apparatus, it being equally applicable to many other well-known electric apparatus.

The said invention consists of several parts to be hereinafter described, the several parts appertaining more or less to each other, and all contributing to the complete system, the several parts being novel, as well in themselves as in their combination into a system as a whole.

Part first of this invention consists—

Firstly. Of a novel method and apparatus by means of which electrical circuits containing electric lamps are supplied with electricity absolutely uniform in volume, and by means of which only so much current as is necessary to meet the demands is automatically supplied, and by means of which the motive power driving the generator is automatically increased or diminished in proportion as the number of lighted lamps is increased or diminished in the circuit of a system.

Secondly. Of a novel distributing system by means of which the current of a single electrical generator may be divided among an indefinite number of lamps.

Thirdly. Of an electric lamp lighting apparatus which not only turns the current on to and off from the lamp gradually, but admits of regulating the light proceeding from the lamp to any desired intensity, and at the same time avoids the danger of fracturing the carbon of the lamp, and of interrupting or changing the resistance of the circuit containing the lamp whenever it is lighted or extinguished.

Part second of this invention consists of an electric apparatus operating to measure the amount of current consumed in a given time by the lamp or other apparatus in circuit.

Part third of this invention consists of a novel method of practically distributing electric currents in towns or cities for the purpose of supplying the street lamps or buildings thereof with electricity in any quantity within the scope of the generator's power.

2791 The foregoing statement of the several parts of this invention, and the following is a detail description of them and of the manner of bringing them in their right relation to each other for operation as a whole, and of the manner of operating them.

(Here follow diagrams marked pp. 2801, 2802, & 2803.)

Part first, reference being had to the drawings:

Figure 1 illustrates an "electric lamp lighting switch," and figures 2, 3 and 4 are diagrams of distributing circuits in connection therewith. Figure 1 consists of a suitable metallic holder A fitted with a groove in its face to carry and hold in position a sliding piece B to which is fixed a flat spring *b*, to one end of which is secured a cross piece *b'*, which, as the slide is moved, makes contact successively with the sixteen pins E, E, and E', E', arranged eight on each side of the spring *b*.

Malby & Sons, Photo-Litho.

London. Printed by George Edward Eyre and William Spottiswoode,
Printers to the Queen's most Excellent Majesty. 1879.

The movement of the slide B backward and forward is accomplished by turning the crank D and D′ which rotates upon a suitable stud *d* set in the frame or bed plate of the switch. At each revolution of the crank the pin *c* fixed in the hub of the crank engages with a tooth C and moves the slide forward one tooth until it has acted upon the last in the slides, when farther motion in that direction is prevented by contact of the cross piece *b*′ with the stop-pin B^2.

Turning the crank in the opposite direction in like manner moves the slide backward until its motion is arrested by contact of the pin *a* with the armature lever G. In lighting an electric lamp it is important to turn on the current gradually, otherwise fractures of carbon burners may ensue. It is possible also that at times when the current is fully turned on to the lamp there may occur an interruption in the supply, extinguishment of the light then follows, and the carbon grows cool. Suppose now that the circuit of the lamp not having been destroyed, but being set for the full force of the current, the supply is suddenly renewed, instantly the illuminating carbon is heated from a low to an exceedingly high temperature, and its fracture may be expected. The electro-magnet F attached to the switch effectually guards against this danger.

Unless the current is circulating in its coils the lamp cannot be lighted, and if there be an interruption in the supply the current cannot circulate in its coils, although the supply may be renewed until the lamp shall first have been taken out of the circuit.

The armature F′ is fixed to the bent lever G (pivoted at *e*), one extremity of which plays between the studs *g* and *g*′, according as the magnet is or is not actuated by the current. The spring *f* acts to force the armature away from the magnet, and establish a connection between the lever G and the stud *g*.

The current from the + side of the generator enters the lever G, and when the circuit is in its normal condition passes by way of the stud *g*′ through the coils of the magnet F to the slide holder A; then by way of the slide B, spring *b*, cross piece *b*′ and the eight pins E′ to the lamp, and outward at the — point. Now a sudden interruption occurs instantly the armature is forced away from the magnet by the spring *f*, and contact of the lever G, with the stud *g* is established. The lamp is now entirely out of the circuit and the current flows solely from the lever through the stud *g* and resistance R outward at the — point.

It is in this position the switch is shown, and the lamp can never be relighted unless the slide B be moved back until the cross piece *b*′ makes contact with pin 1 E when the pin *a* strikes the lever G and forces the armature within the grasp of the magnet, and at the same time establishes a connection between G and *g*′; then if there be a supply of the current the lamp may be lighted by moving the slide B forward, but if there be no supply moving the slide forward will simply release the armature and the lever G will again move to the stud *g*.

It is found that the internal resistance of a properly devised and constructed electric lamp lighted by incandescence is about a sixteenth of an ohm, and it is clearly important to the end that the conditions surrounding other lamps in circuit may not be affected that the 1 resistance of the circuit from the + to — points shall be constant whether the lamp be in or out of the circuit, or whether it be lighted feebly or at its full head. Therefore when the lamp is out of the circuit, i. e., when the cross piece *b′* rests upon the pins 1, 1, the current flows by way of the pin 1 E through the sixteenth of an ohm, resistance R, and outward at the — points. Thus when the lamp is entirely cut out the resistance of the circuit is precisely the same as when the lamp is fully lighted. The pins 1 E′ and 8 E serve no useful purpose other than to keep the cross piece *b′* in position.

Assuming now that it is desired to light the lamp, the current is let on by sevenths, but any other small fraction pursued regularly or varied may be substituted, a single turn of the crank advances the cross piece *b′* upon the two pins 2, 2, and the current divides, six-sevenths of it passing through resistance R′ of one-tenth of an ohm, and resistance R of six-tenths of an ohm outward at — point. The resistance of the first circuit, which we will call the shunt, is therefore .7 ohm, and that of the lamp, 4, .2 ohms, making the resistance from the + point to the — point .6 ohm.

2792 At the next turn of the crank the cross piece b′ bears upon pins 3, 3, and the resistance is as follows:—In the shunt circuit ·84 ohm; in the lamp circuit 2·1 = ·6 ohm. Upon pins 4, 4, the resistance is in the shunt circuit 1·05, in the lamp circuit 1·4, = ·6 ohm. Upon pins 5, 5, the resistance is, in the shunt circuit 1·4, in the lamp circuit 1·05, = ·6 ohm. Upon pins 6, 6, the resistance is, in the shunt circuit 2.1, in the lamp circuit ·84, = ·6 ohm. Upon pins 7, 7, the resistance is, in the shunt circuit 4·2, in the lamp circuit ·7 = ·6 ohm. Upon pins 8, 8, the current no longer flows through the shunt circuit, but solely through the lamp, the resistance of which is ·6 ohm.

To distribute the current from a single generator to two or more electric lamps, engines, or other apparatus we also have recourse to a commu-ator in connection with the generator, which, when there are two circuits from the generator, transmits the electric impulse alternately into each other, and when there are more than two circuits transmits these impulses seriatim into the several circuits.

The method of distribution will be readily understood upon reference to figure 2 of the drawing, in which H is a rotating circuit breaker which alternately establishes and disrupts the circuit from the + side of the generator through the two springs I and I′. Let A, B, C, D, of figure 2, represent the lighting apparatus of figure 1. Now when the spring I is in connection with the rotating commutator disk H the current entering the lamp 1, passes out by way of the point —. The rotation of the eccentric disc now disrupts the current, and by its contact with the spring I′ the current also passing out from the lamp by way of the point —. Were this the whole of the operation the current in each lamp would obviously be intermittent and the light emitted correspondingly so, but by the use of the electric condensers J and J′ the current in the lamp 1 and 2 is rendered continuous, the condensers being so arranged that their discharge through the lamp fills up the gap (so to speak) between the impulses from the generator.

Figure 3 of the drawing indicates many an extension of the plan or method. The impulses from the first commutator H, I, I', are resolved into a continuous current by means of the condensers J and J^3 being directed by means of commutators H', I^2, I^3, and H^2, I^4, I^5, between subcurrents X, Y, and the lamps 1, 2, 3, and 4 provided with condensers J', J^2, J^4, and J^5. It is obvious that this system of subdivision may be continued indefinitely, using one or more condensers, as circumstances may require, for any number of lamps. In figure 4 of the drawings there is substituted for a condenser in a shunt circuit electro magnets or inducing coils K and K' in the direct circuit, the impulses from the commutator, while actuating the lamps, charge the coil. Upon cessation of the impulses the coil discharges a current of the same direction as that which actuated it. The current in each of the circuits is thus rendered continuous.

By figures 5, 6, and 7 of the drawing is shown an adjunct of the distributing apparatus by means of which and its connections with the motive power actuating the electric generator, the supply of current is increased or decreased according to the wants of the lamps or other apparatus in operation. Figure 5 is a side elevation of this apparatus; figure 6, a top view; and figure 7 a cross-section. A is any suitable base piece; B, an electro magnet; C an elongated armature upon the end of a T-shaped cog bar D arranged to slide in gro-ves cut in piece ,E, which piece is pivoted at P in standard F; H and I are pinion wheels meshing in the cogs D, according as that bar is tipped one way or the other. These pinion wheels are in constant motion (motive power not shown) rotating in opposite directions as indicated by the arrows. When the magnet B is not of sufficient power, the spring M, by means of roller L which it carries, depresses the rod D so as to cause its cogs to mesh with pinion I. When the magnet B is strong enough to overcome the spring M the cogs of rod B are thrown out of gear with pinion I and into gear with pinion H; G is a steam chest containing valves operated by a rod K jointed at O with rod J, and rod J is jointed at M with the cog bar D. The rod K moves to the right or left and opens or closes the steam valve according as the spring M or magnet B preponderates in power; Q is the generator of electricity; the points + and — represent the working parts of the circuits of the conductors R, S. T. The magnet B is constantly in the circuit of the conductor. When the supply of current is about right the cog bar D will be in a state of vibration over the pinions I and H. When the circuit of conductor S is made, but half the current originally flowing in R passes through R and the effect upon magnet B is lessened; the armature C then rises and rod D meshes into pinion I, whereby the valve is moved and more steam let into the engine and the generator correspondingly actuated. When the circuit T is established the flow through R is again diminished and a similar operation of the parts results.

It will be seen that the generator so controls the steam or other power actuating the generator of electricity, that the power is increased or diminished as the demand for the current is increased or diminished, and while I have shown the result as accomplished in one way, I do not intend to limit the invention to the precise 2793 apparatus and the manner of its operation shown and described. It is preferred, as shown and described, to place a sensitive magnet apparatus in the circuit of the generator, which, when a lamp is lighted, so to speak, automatically takes cognizance thereof and supplies that quantity of steam to the engine which is necessary to drive the generator at that speed which will give the exact required volume of electricity. The apparatus is so construed, however, that the regulator may be made to start different generators or couple different parts of a single generator in circuit, as may be required to supply the current, or the regulator may be arranged to control the current by the automatic changing of resistances. There are, in fact, many ways naturally suggestive to vary the application of the invention, and hence the invention is not limited to the em*y*loyment of any special form of apparatus, but includes also the substance of the form.

Here ends a detailed description of part first of this invention, which, it will be seen, embraces and includes a novel arrangement, combination and application of electric circuits and lamps in relation to each other, and also a novel distributing division, gradual and safe application of the electric currents to and through the same.

Part second of the invention consists, as before stated, of an "electric measuring apparatus," a detailed description of which is as follows, reference being had to figure 8 of the drawings:

The object of this part of this invention is to provide a meter or register of the current expended in the production of electric light, and such a device being entirely new in the arts, it is intended to claim it broadly as an electric meter, as well as a part of the system comprising this invention as a whole, and it is not intended to confine this invention to the particular form thereof as it appears by the drawings, but it is intended to embrace all forms of meter that include the substance of the form here shown and described.

The meter illustrated and particularly described is one which indicates with dial hands the current expended, in which respect the apparatus does not differ materially from an ordinary gas meter, and it is preferred to actuate it by electro-magnetism, although the apparatus has been very carefully considered for registering by marks or indentations made upon a roll of paper, and mechanism energized by the expansion of metallic conductors from electric heating. The quantity of current being easily determined, the element of time is the prime factor in ascertaining the amount of current consumed. There is therefore placed in a building supplied with electric lamps a meter which indicates exactly how many hours in a given period these lamps may be lighted, viz., a meter which, if there are ten lamps in a building, and each of them be run for ten hours, will indicate a use of one hundred hours.

It is presumable that at least as often as once a month the index will be noted, and it is preferred to actuate the mechanism by ordinary clockwork, to be wound up once a month, though it is obvious that clockwork may be employed to be actuated by the electric current which will not require to be wound up.

For the sake of simplicity, only the salient parts of the meter are shown by the drawing, omitting the clockwork and the case or cover, and such other parts as are well known to those familiar with mechanism of the kind.

Referring to the drawing, D is a metallic cylinder fixed to shaft D′, which is provided with suitable bearings (not shown), and rotated by the clockwork, of which the reciprocating balance-wheel A, actuated in one direction by an ordinary coiled spring, B, constitutes a governor. The cylinder D is provided with as many metallic "contact" pins, E, set spirally, as there are lamps whose operation is to be indicated, and these pins, as the cylinder is rotated in the direction of the arrow, make connection, when the lamps are in operation, with the spring armature levers F, of electro magnets G. When there is no current flowing in the coils of magnet G, the levers F are forced by spring I away from the magnets to contact with the stops H, so that the pins E may pass without making connections with the levers.

All the armature levers F work freely upon shaft J, held in suitable standards, not shown by the drawing. Running along under the outer ends of the levers F is a metal strip, K, fixed to shaft L, L, which when the magnets G are energized, is forced upward by spiral springs I′, acting against arm L′ fixed to the shaft L, L.

To the metal strip K is fixed an arm M, carrying a light flat spring N to which is fixed a bent piece O, the object of which will soon be apparent.

The electric current entering at the + point, traverses a resistance R, passes through the several lighting apparatus of the lamps 1, 2, and 3, and thence outward at the point. R′, R′, R′ are intended to indicate the place of the lamp-lighting apparatus, and the resistance R^2, R^2, R^2, serve, when a lamp is lighted, to direct a portion of the current through the coils of electro-magnets G, the current being as shown by the broken lines.

To understand the operation of this part of the invention, let it be assumed that the lamps are not actuated. The magnets G not being energized, their armature levers F, are raised, and the strip K
also being raised hold the bent piece O in the path of the bent
2794 piece C, fixed to the chronometer-balance A, and the motion
of the clock-work, and consequently of cylinder D, is stayed.
At this point a lamp is lighted; instantly one of the magnets G is energized, its armature lever F is attracted, and coming in contact with the strip K depresses it, by which the bent piece O is thrown to the left and an impetus imparted to the chronometer-balance by reason of the effect of the bent piece O to disengage itself from the bent piece C. The bent piece O being no longer in the path of C, the balance A begins and continues its reciprocating motion, passing from the position shown in the drawing to that in which C

reaches the point A' and thence back again, thus permitting the cylinder D to rotate in the direction of the arrow.

It makes no difference which of the armature levers F is actuated, any one (or all of them together) serve to set the clock-work in motion. It is apparent that the clock-work may be kept continually in motion, but it is preferred that it shall run only so long as the lamps are in operation.

Let it be assumed that the lamps are all extinguished, there being no magnet G energized and no lever F depressing the strip K, the bent piece O drops into the path of C, which as the balance A carries it to the left, rides over piece O by the yielding of spring N, and the motion of the clock-work is stopped. The effect of the rotation of cylinder D is as follows: By means of the resistance R, a portion of the current of the branch or main when a pin E makes connection with a lever F, as shown by the circuit of the light lines, is caused to energize an electro magnet S, the current passing from one side of R to the cylinder D, thence by way of a pin E to a lever F, and thence by way of shaft J to the magnet S, an armature to the other side of R.

If but one lamp is lighted the magnet S will be energized but once in a revolution; if two are lighted it will be energized twice, and if three are lighted, three times, and so on. At each action of the magnet S its armature lever T, pivoted at T', is attracted against spiral spring 1^2, and by means of pawl T^2 held upward by spring T^3, causes the ratchet wheel U to rotate one tooth. Thus, if but one lamp be in operation, the ratchet wheel U will move but one tooth in one revolution of the cylinder D, and if all the lamps are in operation the ratchet will be constantly rotated by the constant vibration of the armature lever T.

The operation of the remainder of the apparatus is apparent, there being as many gears and pinions, hands and dials as may be desired.

The pinion V fixed to ratchet wheel U actuates gear W, and pinion W' fixed to gear W actuates gear *x*. The hands Q, Q', indicate upon disc P P, the current expended.

To properly estimate the consumption of current, so to speak, a lamp should be operated for a given number of hours and the indicators upon the dials noted.

A single lamp operated for the same length of time will invariably present the same record, and two lamps will present a record of twice the value of one lamp, and so on to any extent desired.

Part third of the invention consists as above stated of a novel method of practically distributing electric circuits and currents through the blocks of cities, towns, and villages. The number of blocks may be more or less, as may seem desirable, and the sup-lying station may be located wherever may seem most desirable. There may be any number of generators and conductors employed, and they may be located in the most convenient or desirable places to supply the lamps and the buildings of streets and blocks.

In concluding the description of this invention, it must be repeated that it consists not only of the method or system as a whole, but also of the several parts and subdivisions in whole and in detail, the following points or parts being embraced and included in it, viz:

First. In a single conductor supplied with electricity, two or more lamps in the circuit of the said conductor, and a shunt around each lamp containing a switch.

Second. In a single conductor supplied with electricity, two or more lamps in the circuit of said conductor, and a shunt around each lamp containing a resistance.

Third. In a single conductor supplied with electricity, two or more lamps in the circuit of said conductor, and a shunt around each lamp containing an adjustable resistance.

Fourth. In an electric lighting system in which two or more electric lamps are supplied with electricity from a generator common to both or all of them, the combination with an electric lamp of a secondary circuit, the switch for which destroys the continuity of the secondary circuit at the instant that it directs the flow of current through the lamp, and destroys the continuity of circuit through the lamp at the instant that it completes the secondary circuit with or without a resistance, plain or adjustable around such lamp, substantially as shown and described.

Fifth. In an electric lighting system in which two or more electric lamps are supplied with electricity from a generator common to both or all of them, the combination with two main conductors,
leading one from each pole of the generator in a course per-
2795 fectly parallel of branches connecting the two main con-
ductors at the requisite intervals, in which branches are
placed electric lamps provided with circuit-continuity-preserving apparatus, so that the flow through any branch may never be broken, whether the lamp in that branch is or is not in operation.

Sixth. In an electrical regulator, the combination of two paramagnetic parts C and B, operating substantially as set forth.

Seventh. In an electric lighting system, a generator of electricity, two or more electric lamps supplied thereby, and an independent electro magnet, switch or regulator energized by the current from the generator and acting automatically upon the occurrence of any change of electrical condition in the circuit or circuits supplied to allow of a corresponding change in the quantity or intensity of the current generated.

Eighth. The combination with an electric lamp of a switch, which in lighting the lamp gradually removes a resistance from the circuit thereof.

Ninth. The combination with an electric lamp of a switch, which while preserving the continuity of the circuit gradually removes a resistance from the circuit of the lamp.

Tenth. The combination with an electric lamp of a resistance in the circuit thereof, which is lessened as the resistance of the lamp is increased.

Eleventh. The hereinbefore described method of lighting an electric lamp, consisting in causing the flow of current in such lamp to increase in strength slowly.

Twelfth. The combination with an electric lamp and a lamp lighting switch of two electrical circuits connected therewith, the switch operating to reduce the resistance of one circuit and increase the resistance of the other, in such manner that at each reduction in the resistance of one circuit there will be an increase in the resistance of the other.

Thirteenth. The combination of an electric lamp and a lamp lighting switch of electrical circuits, so arranged that as the resistance in the circuit of the lamp is lessened, and consequently more current caused to flow through the lamp, the resistance of an extraneous channel or channels is increased, each reduction in the resistance of the lamp circuit being accomplished by such increase in the resistance of the extraneous channel or channels that the resistance of the main or branch circuit, which contains the circuit of the lamp and the extraneous channel or channels is maintained at a constant quantity or nearly so.

Fourteenth. The combination with an electric lamp and a shunt or derived circuit around the lamp, of a switch which operates to light the lamp by increasing the resistance of the shunt or derived circuit.

Fifteenth. The combination with an electric lamp of a switching apparatus, which after an interruption of the flow of the current operates to cut the lamp out of the circuit of such switching apparatus before it can be relighted.

Sixteenth. The combination with an electric lamp lighting switch of an apparatus, which operates to prevent the completion of the lamp circuit, when there is no current to energize the lamp.

Seventeenth. The combination of an electric lamp lighting switch with an apparatus energized by the current which actuates the lamp, and that operates to prevent the opening of the lamp circuit to the flow of the current when there is no supply.

Eighteenth. The combination with an electric lamp lighting switch of an apparatus energized by the current which actuates the lamp, and that operates when there is an interruption in the flow of the current to close the circuit of the lamp against a sudden recurrence of such flow.

Nineteenth. The combination with an electric lamp of a switching apparatus, which after an interruption of the flow of the current operates to introduce a resistance into the circuit of the switching apparatus and the lamp before the lamp can be lighted.

Twentieth. In an electric lighting system an electrical apparatus energized by the current flowing in such system, which when there is an abnormal flow of current in a part or parts of such system, automatically operates to disrupt, disconnect or change the current of such part or parts.

Twenty-first. In an electric lighting system two or more conductors supplied with electricity by the generator of electricity, which is the common source of supply for such system, and in each of these conductors or in circuits derived therefrom two or more electric lamps, the same being so arranged for the purpose of insuring the necessary distribution and subdivision of the current, without artificial lengthening of the circuits by the introduction of resistances which would only waste the current, as set forth.

Twenty-second. An electric distributing system in which the current from a single generator transmitted intermittently through two or more circuits, is rendered continuous in such circuits by induction apparatus energized by such intermittently transmitted current.

Twenty-third. The combination with one or more electric lamps of a meter or register, showing the consumption or expenditure of current in operating the same.

Twenty-fourth. The combination with one or more electric lamps of a meter or register, showing the time during which the said lamp or lamps are operated.

2796 Twenty-fifth. A meter or register of the consumption or expenditure of current in the operation of one or more electric lamps, consisting of a dial or dials actuated by the current.

Twenty-sixth. In a meter or a register of the consumption or expenditure of current in the operation of one or more electric lamp apparatus, actuated by the current to indicate the time during which the operation of the same continues.

Twenty-seventh. In a meter or register of the consumption or expenditure of current in the operation of one or more electric lamp mechanism, set in motion by the current upon the lighting of a lamp, and stopped upon the extinguishment of the same or all the lamps.

Twenty-eighth. In a meter or register of the consumption or expenditure of current in the operation of one or more electric lamps, the combination with primary apparatus for setting a clockwork in motion of secondary apparatus, actuated by any one or more lamps to actuate the primary apparatus.

Twenty-ninth. In a meter or register of the consumption or expenditure of current in the operation of one or more electric lamps, the combination with such lamp or lamps of apparatus energized by the current operating such lamp or lamps.

Thirtieth. In an electric light meter, the cylinder D presenting spirally arranged points of contact.

Thirty-first. In an electric light meter, the combination of the cylinder D and levers F.

Thirty-second. In an electric light meter, the combination of the cylinder D, and electro magnet G.

Thirty-third. In an electric light meter, the combination of the lever and magnet G.

Thirty-fourth. In an electric light meter, the combination of the lever F and strip K.

Thirty-fifth. In an electric light meter, the combination of the detent piece O and spring N.

Specification in pursuance of the conditions of the letters patent filed by the said Frederick John Cheesbrough in the Great Seal Patent Office on the 17th May, 1879.

Frederick John Cheesbrough, of the office for patents, 15 Water street, Liverpool, in the county of Lancaster, consulting engineer. "An improved method or system of distributing, dividing, regulating, controlling, and measuring electric currents in the practical application of the same to electric lighting and other useful purposes." A communication from abroad by William Edward Sawyer, of New York city, county, and State, and Albon Man, of Brooklyn, county of Kings, State of New York, United States of America.

In order that this invention may be fully understood, I have hereunto attached a sheet of drawings, which illustrates the said invention and in what manner the same is to be performed, reference being had to the drawings, which are marked with letters and figures of reference corresponding with those in the following specification.

The object of this invention is to obtain a perfect distributing division, regulation, and mensuration of electric currents as applied particularly to electric lighting, although the practical application of the invention is not limited to electric lighting apparatus, it being equally applicable to many other well known electric apparatus.

The said invention consists of several parts to be hereinafter described, the several parts appertaining more or less to each other, and all contributing to the complete system, the several parts being novel as well in themselves as in their combination into a system as a whole.

Part first of this invention consists :—

Firstly. Of a novel method and apparatus, by means of which electrical circuits containing electric lamps are supplied with electricity absolutely uniform in volume, and by means of which only so much current as is necessary to meet the demand is automatically supplied, and by means of which the motive power driving the generator is automatically increased or diminished in proportion as the number of lighted lamps is increased or diminished in the circuit of a system.

Secondly. Of a novel distributing system, by means of which the current of a single electrical generator may be divided among an indefinite number of lamps.

Thirdly. Of an electric lamp lighting apparatus, which not only turns the current on to and off from the lamp gradually, but admits of regulating the light proceeding from the lamp to any desired intensity, and at the same time avoids the danger of fracturing the carbon of the lamp, and of interrupting or changing the resistance of the circuit containing the lamp, whenever it is lighted or extinguished.

2797 Part second of this invention consists of an electric apparatus operating to measure the amount of current consumed in a given time by the lamp or other apparatus in the circuit.

Part third of this invention consists of a novel method of practically distributing electric currents in towns or cities, for the purpose of supplying the street lamps or buildings thereof with electricity in any quantity within the scope of the generator's power.

The foregoing is a general statement of the several parts of the invention, and the following is a detail description of them, and of the manner of bringing them in their right relation to each other for operation as a whole, and of the manner of operating them.

Part first, reference being had to the drawings:

Figure 1 illustrates an "electric lamp lighting switch," and figures 2, 3 and 4, are diagrams of distributing circuits in connection therewith. Figure 1 consists of a suitable metallic holder A, fitted with a groove in its face to carry and hold in position a sliding piece B, to which is fixed a flat spring *b*, to one end of which is secured a cross piece *b'*, which as the slide is moved makes contact successively with the sixteen pins E, E, and E', E', arranged eight on each side of the spring *b*.

The movement of the slide B backward and forward is accomplished by turning the crank D and D', which rotates upon a suitable stud *d* set in the frame or bed plate of the switch. At each revolution of the crank, the pin C fixed in the hub of the crank engages with a tooth *c* and moves the slide forward one tooth until it has acted upon the last in the slide, when further motion in that direction is prevented by contact of the cross piece *b'* with the stop pin *b* 2.

Turning the crank in the opposite direction in like manner moves the slide backward until its motion is arrested by contact of the pin *a*, with the armature lever G. In lighting an electric lamp it is important to turn on the current gradually, otherwise fractures of the carbon burners may ensue. It is possible also that at times, when the current is fully turned on to the lamp, there may occur an interruption in the supply, extinguishment of the light then follows, and the carbon grows cool. Suppose now that the circuit of the lamp not having been destroyed but being set for the full force of the current, the supply is suddenly renewed, instantly the illuminating carbon is heated from a low to an exceedingly high temperature, and its fracture may be expected. The electro-magnet F attached to the switch effectually guards against this danger.

Unless the current is circulating in its coils the lamp cannot be lighted, and if there be an interruption in the supply the current cannot circulate in its coils, although the supply may be renewed until the lamp shall first have been taken out of the circuit.

The armature F' is fixed to the bent lever G (pivoted at E), one extremity of which plays between the studs *g* and *g'*, according as the magnet is or is not actuated by the current. The spring *f* acts to force the armature away from the magnet and establish a connection between the lever G and the stud *g*.

The current from the + side of the generator enters the lever G, and when the circuit is in its normal condition passes by way of the stud *g'* through the coils of the magnet F to the slide holder A. then by way of the slide B, spring *b*, cross piece *b'*, and the eight pins E' to the lamp and outward at the — point. Now a sudden interruption occurs instantly the armature is forced away from the magnet by the spring *f*, and contact of the lever G with the stud *g* is established. The lamp is not entirely out of the circuit, and the current flows solely from the lever through the stud *g* and resistance R outward at the — point.

It is in this position the switch is shown, and the lamp can never be relighted unless the slide B be moved back until the cross piece *b'* makes contact with pin 1 E, when the pin *a* strikes the lever G and forces the armature within the grasp of the magnet, and at the same time establishes a connection between G and *g'*; then, if there be a supply of the current the lamp may be lighted by moving the slide B forward, but if there be no supply, moving the slide forward will simply release the armature, and the lever G will again move the stud *g*.

It is found that the internal resistance of a properly devised and constructed electric lamp lighted by incandescence is about a sixteenth of an ohm, and it is clearly important to the end that the conditions surrounding other lamps in circuit may not be affected, that the 1 resistance of the circuit from the + to — points shall be constant, whether the lamp be in or out of the circuit, or whether it be lighted feebly or at its full head. Therefore when the lamp is out of the circuit, *i. e.*, when the cross piece *b'* rests upon the pins 1, 1, the current flows by way of the points. Thus, where the lamp is entirely cut out the resistance of the circuit is precisely the same as when the lamp is fully lighted. The pins 1 E' and 8 E serve no useful purpose other than to keep the cross piece *b'* in position.

Assuming now that it is desired to light the lamp the current is led on by sevenths, but any other small fraction pursued regularly or varied may be substituted; a single turn of the crank advances the cross piece *b'* upon the two pins 2, 2, and the current divides, six-sevenths of it passing through resistance R' of one-tenth
2798 of an ohm, and resistance R of six-tenths of an ohm outward at the — points. The resistance of the first circuit, which we will call the shunt is, therefore, .7 ohm, and that of the lamp 4.2 ohms, making the resistance from the + point to the — point .6 ohm.

At the next turn of the crank the cross piece *b'* bears upon pins 3, 3, and the resistance is as follows: In the shunt circuit .84 ohm, in the lamp circuit 2.1=.6 ohm. Upon pins 4, 4, the resistance is in the shunt circuit 1.05, in the lamp circuit 1.4=.6 ohm. Upon pins 5, 5, the resistance is in the shunt circuit 1.4, in the lamp circuit 1.05=.6 ohm. Upon pins 6, 6, the resistance is in the shunt circuit 2.1, in the lamp circuit .84=.6 ohm. Upon pins 7, 7, the resistance is in the shunt circuit 4.2, in the lamp circuit .7=.6 ohm. Upon pins 8, 8, the current no longer flows through the shunt circuit, but solely through the lamp, the resistance of which is .6 ohm.

To distribute the current from a single generator to two or more electric lamps, engines, or other apparatus, we also have recourse to a commutator in connection with the generator, which when there are two circuits from the generator transmits the electric impulse alternately into each, and when there are more than two circuits transmits these impulses seriatim into the several circuits.

The method of distribution will be readily understood upon reference to figure 2 of the drawing, in which H is a rotating circuit breaker which alternately establishes and disrupts the circuits from the + side of the generator through the two springs I and I'. Let A, B, C, D, of figure 2, represent the lighting apparatus of figure 1, now when the spring I is in connection with the rotating commutator disk H, the current entering the lamp 1 passes out by way of the point —. The rotation of the eccentric disk now disrupts the current, and by its contact with the spring I', the current also passing out from the lamp by way of the point —. Were this the whole of the operation the current in each lamp would obviously be intermittent and the light emitted correspondingly so, but by the use of electric conductors J and J', the current in the lamp 1 and 2 is rendered continuous, the condensers being so arranged that their discharge through the lamp fills up the gap (so to speak) between the impulses from the generator.

Figure 3 of the drawing indicates merely an extension of the plan or method. The impulses from the first commutator H, I, I', are resolved into a continuous current by means of the condensers J and J^3 being directed by means of commutators H', I^2, I^3, between subcurrents X, Y, and lamps 1, 2, 3, and 4, provided with condensers J', J^2, J^4 and J^5. It is obvious that this system of subdivision may be continued indefinitely, using one or more condensers as circumstances may require for any number of lamps. In figure 4 of the drawing there is substituted for a condenser in a shunt circuit electro-magnets or inducing coils K and K'; in the direct circuit the impulses from the commutator while actuating the lamps charge the coil. Upon cessation of the impulses the coil discharges a current of the same direction as that which actuated it. The current in each of the circuits is thus rendered continuous.

By figures 5, 6 and 7, of the drawings is shown an adjunct of the distributing apparatus by means of which and its connections with the motive power actuating the electric generator the supply of current is increased or decreased according to the wants of the lamps or other apparatus in operation. Figure 5 is a side elevation of this apparatus; figure 6 is a top view; and figure 7, a cross section. A is any suitable base piece; B, an electro magnet; C, an elongated armature upon the end of a T-shaped cog bar D arranged to slide in grooves cut in piece E, which piece is pivoted at P in standard F; H and I are pinion wheels meshing in the cogs of D according as that bar is tipped one way or the other. These pinion wheels are in constant motion (motive power not shown) rotating in opposite directions, as indicated by the arrows. When the magnet B is not of sufficient power the spring M by means of roller L, which it carries, depresses the rod D so as to cause its cogs to mesh with pinion I. When the magnet B is strong enough to overcome the spring M the cogs of rod D are thrown out of gear with pinion I and into gear with pinion H; G is a steam chest containing valves operated by a rod K jointed at O with rod J, and rod J is jointed at N with the cog bar D. The rod K moves to the right or left and opens or closes the steam valve according as the spring M or magnet B preponderates in power; Q is the generator of electricity; the points + and — represent the working parts of the circuit of the conductors R S T. The magnet B is constantly in the circuit of the conductor. When the supply of current is about right the cog rod D will be in a state of vibration over the pinions I and II. When the circuit of conductor S is made, but half the current originally flowing in R passes through R, and the effect upon magnet B is lessened; the armature C then rises and rod D meshes into pinion I, whereby the valve is moved and more steam let into the engine and the generator correspondingly actuated. When the circuit T is established the flow through R is again diminished and a similar operation of the parts results.

2799 It will be seen the generator so controls the steam or other power actuating the generator of electricity that the power is increased or diminished as the demand for the current is increased or diminished, and while I have shown the result as accomplished in one way I do not intend to limit the invention to the precise apparatus and the manner of its operation shown and described. It is preferred, as shown and described, to place a sensitive magnetic apparatus in the circuit of the generator which, when a lamp is lighted, so to speak, automatically takes cognizance thereof and supplies that quantity of steam to the engine which i*f* necessary to drive the generator at that speed which will give the exact required volume of electricity. The apparatus is so constructed, however, that the regulator may be made to start different generators or couple different parts of a single generator in circuit as may be required to supply the current, or the regulator may be arranged to control the current, by the automatic changing of resistances. There are in fact many ways naturally suggestive to vary the application of the invention, and hence the invention is not limited to the employment of any special form of apparatus, but includes also the substance of the form.

Here ends a detail description of part first of the invention, which will be seen embraces and includes a novel arrangement, combination, and application of electric circuits and lamps in relation to each other and also a novel distributing division, gradual and safe application of the electric currents to and through the same.

Part second of the invention consists as before stated of an "electric measuring apparatus" a detail description of which is as follows, reference being had to figure 8 of the drawings:

The object of this part of this invention is to provide a meter or register of the current expended in the production of electric light, and such a device being entirely new in the arts, it is intended to claim it broadly as an electric meter as well as a part of the system comprising this invention as a whole, and it is not intended to confine this invention to the particular form thereof, as it appears by the drawings, but it is intended to embrace all forms of meter that include the substance of the form here shown and described.

The meter illustrated and particularly described is one which indicates with dial hands the current expended in which respect the apparatus does not differ materially from an ordinary gas meter, and it is preferred to actuate it by electro-magnetism although the apparatus has been very carefully considered for registering by marks or indentations made upon a roll of paper, and mechanism energized by the expansion of metallic conductors from electric heating. The quantity by current being easily determined, the element of time is the prime factor in ascertaining the amount of current consumed. There is therefore placed in a building supplied with electric lamps a meter, which indicates exactly how many hours in a given period these lamps may be lighted, viz., a meter which if there are ten lamps in a building, and each of them be run for ten hours will indicate a use of one hundred hours.

It is presumable that at least as often as once a month the index will be noted, and it is preferred to actuate the mechanism by ordinary clock-work to be wound up once a month though it is obvious that clock-work may be employed to be actuated by the electric current, which will not be required to be wound up.

For the sake of simplicity only the salient parts of the meter is shown by the drawing, omitting the clock-work and case or cover, and such other parts as are well known to those familiar with mechanism of this kind.

Referring to the drawing, D is a metallic cylinder fixed to shaft D', which is provided with suitable bearings (not shown) and rotated by the clock-work, of which the reciprocating balance wheel A actuated in one direction by an ordinary coil spring B constitutes the governor. The cylinder D is provided with as many metallic "contact" pins E, set spirally as there are lamps whose operation is to be indicated; and these pins as the cylinder is rotated in the direction of the arrow make connection when the lamps are in operation with the spring armature levers F of electro-magnets G. When there is no current flowing in the coils of magnets G, the levers F are forced by spring I away from the magnets to contact with the stops H, so that the pins E may pass without making connection with the levers.

All the armature levers F work freely upon shaft J held in suitable standards, not shown by the drawing. Running along under the outer ends of the levers F is a metal strip K fixed to shaft L L, which when the magnets G are energized is forced upward by spiral springs I' acting against arm L' fixed to the shaft L L.

To the metal strip K is fixed an arm M carrying a light flat spring N to which is fixed a bent piece O, the object of which will soon be apparent.

The electric current entering at the — point traverses a resistance R, passes through the several lighting apparatus, and the resistances R^2, R^2, R^2, serve when a lamp is lighted to direct a portion of the current through the coils of the electro magnets G, the current being as shown by the broken lines.

To understand the operation of this part of the invention,
2800 let it be assumed that the lamps are not actuated. The
magnets G not being energized, their armature levers F are

raised and the strip K also being raised, holds the bent piece O in the path of the bent piece C fixed to the chronometer balance A and the motion of the clock-work, and consequently of cylinder D is stayed. At this point a lamp is lighted, instantly one of the magnets G is energized its armature lever F is attracted, and coming in contact with the strip K depresses it, by which the bent piece O is thrown to the left, and an impetus imparted to the chronometer balance, by reason of the effort of the bent piece O to disengage itself from bent piece C. The bent piece O being no longer in the path of C, the balance A begins and continues its reciprocating motion, passing from the position shown in the drawing to that in which C reaches the point A', and thence back again. Thus permitting the cylinder D to rotate in the direction of the arrow.

It makes no difference which of the armature levers F is actuated; any one (or all of them together) serve — set the clock-work in motion. It is apparent that the clock-work may be kept continually in motion, but it is preferred that it shall run only so long as the lamps are in operation.

Let it be assumed that the lamps are all extinguished. There being no magnet G energized and no lever F depressing the strip K, the bent piece O drops into the path of *c*, which as the balance A carries it to the left, rides over piece O by the yielding of spring N, and the motion of the clock-work is stopped. The effect of the rotation of cylinder D is as follows: By means of the resistance R a portion of the current of the branch or main, when a pin E makes connection with a lever F as shown by the circuit of the light lines, is caused to energize an electro magnet S, the current passing from one side of R to the cylinder D, thence by way of a pin E to a lever F, and thence by way of shaft J to the magnet S and armature to the other side of R.

If but one lamp is lighted it will be energized but once in a revolution, if two are lighted it will be energized twice, and if three are lighted three times, and so on. At each action of the magnet S its armature lever T pivoted at T' is attracted against spiral spring I^2, and by means of pawl T^2 held upward by spring T^3 causes the ratchet wheel U to rotate one tooth. Thus if but one lamp be in operation the ratchel wheel U will move but one tooth in one revolution of the cylinder D, and if all the lamps are in operation the ratchet will be constantly rotated by the constant vibration of the armature lever T.

The operation of the remainder of the apparatus is apparent, there being as many gears and pinions, hands and dials, as may be desired.

The pinion V, fixed to ratchet wheel U, actuates gear W, and pinion W' fixed to gear W, actuates gear X. The hands Q and Q' indicate upon disc P, P, the current expended.

To properly estimate the consumption of current, so to speak, a lamp should be operated for a given number of hours, and the indications upon the dials noted.

A single lamp operated for the same length of time will invariably present the same record, and two lamps will present a record of twice the value of one lamp, and so on to any extent desired.

Part third of the invention consists, as above stated, of a novel method of practically distributing electric circuits and currents through the blocks and streets of cities, towns, and villages. The number of blocks may be more or less as may seem desirable. There may be any number of generators and conductors employed, and they may be located in the most convenient or desirable places to supply the lamps and buildings of the streets and blocks.

In concluding the description of this invention, it must be repeated that it consists not only of the method or system as a whole, but also of the several parts and subdivisions in whole and in detail, the following points or parts being embraced and included in it, viz:

(Here follow claims thirty-five in number, which are identical with those of the provisional specification.)

In witness whereof, I, the said Frederick John Cheesbrough, have hereunto set my hand and seal, this fifteenth day of May, in the year of our Lord, one thousand eight hundred and seventy-nine.

CONSOLIDATED ELECTRIC LIGHT COMPANY
vs.
EDISON ELECTRIC LIGHT COMPANY and T. A. EDISON. } Dock. H., 3553.

COMPLAINANT'S EXHIBIT NO. 1, PATENT IN SUIT. May 11, 1886.
T. G., Ex'r.

THE UNITED STATES OF AMERICA.

(Engraving.)

No. 317,676.

To all to whom these presents shall come:

Whereas, William Edward Sawyer of New York, and Albon Man of Brooklyn, New York, have presented to the Commis-

2805 sioner of Patents a petition praying for the grant of letters patent for an alleged new and useful improvement in electric lights, they having assigned their right, title and interest in said improvement to the Electro Dynamic Light Company, of New York, a description of which invention is contained in the specification of which a copy is hereunto annexed and made a part hereof, and have complied with the various requirements of law in such cases made and provided; and

Whereas, upon due examination made, the said claimants are adjudged to be justly entitled to a patent under the law.

Now therefore, these letters patent are to grant unto the said Electro Dynamic Light Company, its successors or assigns for the term of seventeen years from the twelfth day of May, one thousand eight hundred and eighty-five, the exclusive right to make, use and vend the said invention throughout the United States and the territories thereof.

In testimony whereof I have hereunto set my hand and caused the seal of the Patent Office to be affixed, at the city of Washington, this twelfth day of May, in the year of our Lord one thousand eight hundred and eighty-five, and of the Independence of the United States of America the one hundred and ninth.

H. L. MULDROW,
Acting Secretary of the Interior.

Countersigned.
M. V. MONTGOMERY,
Commissioner of Patents.

2806 UNITED STATES PATENT OFFICE.

WILLIAM EDWARD SAWYER, of New York, and ALBON MAN, of Brooklyn, N. Y., assignors to Electro Dynamic Light Company of New York.

Electric Light.

Specification forming part of Letters Patent No. 317,076, dated May 12, 1885. Application filed January 9, 1880.

To all whom it may concern:

Be it known that we, William E. Sawyer, a resident of the city, county, and State of New York, and Albon Man, a resident of Brooklyn, in the county of Kings and State aforesaid, both citizens of the United States, *improvements in electric lamps, of which jointly have invented certain new and useful improvements the following is a specification:*

Our invention, speaking generally, relates to that class of electric lamps employing an incandescent conductor inclosed in a transparent hermetically sealed vessel or chamber, from which oxygen is excluded, and constitutes an improvement upon the apparatus shown in letters patent No. 205,144, granted to us June 18, 1878.

Our invention relates more especially to the incandescing conductor, its substance, its form, and its combination with the other elements composing the lamp. Its object is to secure a cheap and effective apparatus; and our improvement consists, first, of the combination, in a lamp chamber composed wholly of glass, as described in patent No. 205,144, of an incandescing conductor of carbon made from a vegetable fibrous material, in contradistiction to a similar conductor made from mineral or gas corbon, and also in the form of such conductor so made from such vegetable carbon, and combined in the lighting circuit within the exhausted chamber of the lamp.

The accompanying drawings show all our improvements
2807 embodied in an apparatus or lamp substantially like that
represented in the patent above referred to, being the form in which we have practically used it; but some of our improvements may be used in connection with other forms of lamps with equally good effect.

Reference being had to said drawings, figure 1 is a top view of the lamp; Fig. 2, a side elevation thereof; Fig. 3, a side view in elevation of the burner on an enlarged scale to show its details more clearly, and Fig. 4 is a similar edge view.

Fig. 5 of the drawings shows a vertical section through the bottom of the lamp. In this figure *x* is a glass flange on the bottom of the lamp chamber. *y* is a glass disk corresponding in size to the flange, and is ground to the bottom thereof to form an air-tight joint so that the entire wall of the chamber is formed of glass, the electrodes passing through the glass disk in the manner shown to form the lighting circuit in the chamber, substantially as in said patent No. 205,144. The sealing of the electrodes, where they pass through the glass wall, is done with any suitable cement, or in any of the well-known methods of sealing glass upon metal electrodes previous to the filing of this application.

The electric connections of this lamp are made in the base thereof, substantially the same as in our patent No. 210,809, dated December 10, 1878, and the whole bottom is inclosed in a cup filled with wax or other suitable cement, the same as in that patent, the cement sealing in this lamp being also applied in substantially the same way as in the patent last above mentioned, the invention making the subject-matter of this application being improvements upon the lamps described in the patents above referred to, to the extent of the claims making part hereof.

In the practice of our invention we have made use of carbonized
paper, and also wood carbon. We have also used such con-
2808 ductors or burners of various shapes such as pieces with their
lower ends secured to their respective supports and having their upper ends united so as to form an inverted-V-shaped burner. We have also used conductors of varying contours—that is, with rectangular bends instead of curvilinear ones; but we prefer the arch shape.

No especial description of making the illuminating carbon conductors, described in this specification and making the subject-matter of this improvement, is thought necessary, as any of the ordinary methods of forming the material to be carbonized to the desired shape and size, and carbonizing it while confined in retorts in powdered carbon, substantially according to the methods in practice before the date of this improvement, may be adopted in the practice thereof by any one skilled in the arts appertaining to the making of carbons for electric lighting or for other use in the arts.

An important practical advantage which is secured by the arch form of incandescing carbon is that it permits the carbon to expand and contract under the varying temperatures to which it is subjected when the electric current is turned on or off without altering the position of its fixed terminals. Thus the necessity for a special mechanical device to compensate for the expansion and contraction which has heretofore been necessary is entirely dispensed with, and thus the lamp is materially simplified in its construction. Another advantage of the arch form is that the shadow cast by such burners is less than that produced by others of burners when fitted with the necessary devices to support them.

Another important advantage resulting from our construction of the lamp results from the fact that the wall forming the chamber of the lamp through which the electrodes pass to the interior of the lamp is made wholly of glass, by which all danger of oxidation, leakage, or short-circuiting is avoided.

2809 The advantages resulting from the manufacture of the carbon from vegetable fibrous or textile material instead of mineral or gas carbon are many. Among them may be mentioned the convenience afforded for cutting and making the conductor in the desired form and size, the purity and equality of the carbon obtained, its susceptibility to tempering, both as to hardness and resistance, and its toughness and durability. We have used such burners in closed or hermetically sealed transparent chambers, in a vacuum, in nitrogen gas, and in hydrogen gas; but we have obtained the best results in a vacuum, or an attenuated atmosphere of nitrogen gas, the great desideratum being to exclude oxygen or other gases capable of combining with carbon at high temperatures from the incandescing chamber, as is well understood.

The nature of our inventions and the operation of our improved lamp will be readily understood from the foregoing description and the following claims.

We claim as our joint invention—

1. An incandescing conductor for an electric lamp, of carbonized fibrous or textile material and of an arch or horseshoe shape, substantially as hereinbefore set forth.

2. The combination, substantially as hereinbefore set forth, of an electric circuit and an incandescing conductor of carbonized fibrous material, included in and forming part of said circuit, and a transparent hermetically sealed chamber in which the conductor is inclosed.

3. The incandescing conductor for an electric lamp, formed of carbonized paper, substantially as described.

4. An incandescing electric lamp consisting of the following elements in combination: first, an illuminating chamber made wholly of glass hermetically sealed, and out of which all carbon-consuming gas has been exhausted or driven; second, an electric 2810 circuit conductor passing through the glass wall of said chamber and hermetically sealed therein, as described; third, an illuminating conductor in said circuit, and forming part thereof within said chamber, consisting of carbon made from a fibrous or

textile material, having the form of an arch or loop, substantially as described, for the purpose specified.

In testimony whereof we have hereunto subscribed our names this 8th day of January, 1880.

File-wrapper and Contents. Application for Patent in Suit. May 11, 1886. T. G., Ex'r.

Consolidated Electric Light Co.
vs. } G, 3553.
Edison Electric Light Co. *et al.*

Department of the Interior,
United States Patent Office.

To all persons to whom these presents shall come, Greeting:

This is to certify that the annexed is a true copy from the files of this office of the file-wrapper and contents in the matter of the letters patent granted William Edward Sawyer and Albon Man, assignors to Electro-Dynamic Light Company, May 12, 1885, number 317,676, for improvement in electric light.

In testimony whereof I, M. V. Montgomery, Commissioner of Patents, have caused the seal of the Patent Office to be affixed [L. S.] this 16th day of June, in the year of our Lord one thouthousand eight hundred and eighty-five, and of the Independence of the United States the one hundred and ninth.

M. V. MONTGOMERY,
Commissioner.

2812 To the Commissioner of Patents:

Your petitioners, William E. Sawyer, a resident of the city, county and State of New York, and Albon Man, a resident of the city of Brooklyn, in the county of Kings, in the State aforesaid, both citizens of the United States, pray that letters patent of the United States may be granted to the Electro-Dynamic Light Company of New York as their assignees for the improvements in electric lamps or lights set forth in the annexed specification.

Also, that you will recognize William D. Baldwin, of Washington, D. C., as their duly authorized attorney in the premises, with full power of substitution and revocation to prosecute this application, to make alteration and amendments therein, to receive the patent and to transact all business in the Patent Office connected therewith.

And they hereby request that the patent may be issued to the Electro-Dynamic Light Company of New York as their assignee.

WILLIAM EDWARD SAWYER.
ALBON MAN.

The Electro-Dynamic Light Company hereby concurs in the above petition and power of attorney.

2813 To all whom it may concern:

Be it known that we, William E. Sawyer, a resident of the city, county and State of New York, and Albon Man, a resident of Brooklyn, in the county of Kings and State aforesaid, both cit*cit*izens of the United States, jointly have invented certain new and useful improvements in electric lights or lamps, of which improvements the following is a specification:

Erase per sub., May 17, '88.

Our invention, speaking generally, relates to that class of electric light employing an incandescent conductor enclosed in a vessel or chamber from which oxygen is excluded, and constitutes an improvement upon the apparatus shown in letters patent No. 206,144, granted to us June 18, 1878.

Our present invention especially relates to the incandescent conductor; its object is to secure a cheap and effective apparatus, and our improvement consists in the employment of an incandescent arc of carbon in the circuit as the light-giving medium. The subject-matter claimed is hereinafter specifically designated..

The accompan-ing drawings show our improvement as embodied in an apparatus substantially like that represented in the patent above mentioned, being the form in which we have practically used it, but it may be used in connection with other forms of apparatus with good effect.

Fig. 1 represents a plan or top view of the apparatus.

Fig. 2, a side elevation thereof. The apparatus being old and well known except as hereinafter stated and constituting no part of the subject-matter herein claimed, needs no particular description.

Fig. 3, a side view or elevation of the burner on an enlarged scale to show its details more clearly, and

2814 Fig. 4, a similar edge view.

Our improved burner or incandescent arc consists of an arc-shaped or semi-cylindrical piece of carbon, A, mounted in its clamps or supports in usual well-known ways.

We have tried c*rr*bonized paper, covered with powdered plumbago, wood carbon or charcoal, and ordinary gas carbon.

We have also used such arcs or burners of various shapes such as pieces with their lower ends secured to their respective sup-

[Matter enclosed between rules erased in copy.]

ports, and with their upper ends united so as to form an inverted-V-shaped burner.

We have also used arcs of varying contours, that is, with rectangular bends instead of curvilinear ones; but prefer the arch shape as the shadow cast by such a burner is less than that produced by other forms of burners.

We have used such burners in close transparent chambers in a vacuum, in nitrogen gas and in hydrogen gas, but have attained the best results in a vacuum or attenuated atmosphere of nitrogen, the great desideratum being to exclude oxygen from the combustion chamber as is well understood.

The operation of our improved apparatus will readily be understood from the foregoing description.

We claim as of our own joint invention:

First. Incandescing arcs for electric lights made of carbon, substantially as hereinbefore set forth.

Second. Incandescing arcs of carbon in combination with the circuit of an electric light.

Third. The combination substantially as hereinbefore set forth, of the circuit of an electric light, an incandescing arc of carbonized paper included in the circuit and a close transparent chamber in which the arc is inclosed.

2815 Fourth. An incandescing arc made of carbonized fibrous or textile material.

In testimony whereof, we have hereunto subscribed our names this eighth day of January, 1880.

2818 New York, *January 9th*, 1880.

To the Commissioner of Patents.

Sir: Messrs. Sawyer and Man having this day made an application for patent for electric lamp, and assigned the same to the Electro-Dynamic Light Company of New York, and in said application Mr. Wm. D. Baldwin was appointed attorney for the inventors. Now the said company hereby assents to and concurs in said appointment.

THOMAS WALLACE,
Pres't Electro-Dynamic Light Co.

Witness-:
ALBON MAN.
W. K. APPLEBAUGH, *New York.*

(Endorsement: Sawyer and Man, electric light. Filed January 9, 1880. Concurrence of assignees. U. S. Patent Office, Jan. 10, 1880.)

Washington, D. C., *Jan. 14th*, 1880.

To the Commissioner of Patents.

Sir: I hereby appoint Baldwin, Hopkins & Peyton, of Washington, D. C., (a firm composed of Wm. D. Baldwin, Marcus S. Hopkins, and Jos. I. Peyton) my associate attorneys in the matter of the application of Sawyer & Man for patent for electric light, filed

January 9, 1880, with full power to transact all business in connection therewith.

Respectfully, WM. D. BALDWIN.

(Endorsement: $\frac{155}{73}$. 2. Letter Apr. 26, '80.)

[*Words and figures enclosed in brackets erased in copy.]

2821 In the United States Patent Office.

In the Matter of the Application of SAWYER AND MAN for Electric Lamps. Filed Jan. 9, 1880. } No. 547.

To the Commissioner of Patents:

Substitute the following for the specification originally filed:

"To all whom it may concern:

Sub. spec., May 17, '80.

Be it known, that we, William E. Sawyer, a resident of the city, county and State of New York, and Albon Man, a resident of Brooklyn, in the county of Kings and State aforesaid, both citizens of the United States, jointly have invented certain new and useful improvements in electric lamps; of which improvements the following is a specification:

Feb. 19, '85.

Our invention, speaking generally, relates to that class of electric lamps employing an incandescent conductor enclosed in a transparent hermetically sealed vessel or chamber from which oxygen is excluded, and constitutes an improvement upon the apparatus shown in letters patent No. 205,144 [206,144,]* granted to us June 18, 1878.

Substitute B, Feb. 28, '83.

Feb. 19, '85.

Our invention more especially relates to the incandescent conductor. Its object is to secure a cheap and effective apparatus, and our improvement consists in the employment of an incandescing arch [arc]* of carbon in the circuit as the light-giving medium. The subject-matter claimed is hereinafter specifically designated.

2822 The accompanying drawings show all our improvements as embodied in an apparatus substantially like that represented in the patent above mentioned, being the form in which we have practically used it, but some of our improvements may be used in connection with other forms of apparatus with good effect.

Figure 1, represents a plan or top view of the apparatus.

Figure 2, a side elevation thereof.

Figure 3, a side view in elevation of the burner on an enlarged scale to show its details more clearly; and

Figure 4, a similar edge view.

The apparatus being old and well known, except as hereinafter stated, and constituting no part of the subject-matter herein claimed, needs no particular description.

Feb. 19, '85.

Our improved burner or incandescing conductor [arc]*

[* Words and figures enclosed in brackets erased in copy.]
[Matter enclosed between rules erased in copy.]

circular
" " " consists of a horseshoe-shaped or semi-[cylin-
made
drical]* arch of carbon, [preferably]* of carbonized, fibrous or textile material, A, mounted in suitable stationary clamps or supports, and included in an electric circuit. We have made
Feb. 20, '85. use of carbonized paper, [covered with powdered plumbago;]* also wood carbon, charcoal,
the like.
and [ordinary gas carbon.]* We have also
incandescing conductors
used such [arcs]* or burners of various shapes, such as pieces with their lower ends secured to their respective supports, and with their upper ends united so as to form an inverted-V-shaped
incandescing conductors
" " " burner. We have also used [arcs]* of varying contours, that is, with rectangular bends instead of curvilinear ones, but prefer the arch shape. An important practical advantage, which is secured by the arched form of the incandescing carbon, is that it permits the carbon to
2823 expand and contract longitudinally, under the varying temperatures to which it is subjected, when the electric current is turned on or of-, without altering the position of its fixed terminals. Thus the necessity of a special mechanical device to compensate for the expansion and contraction which has heretofore been necessary, is entirely dispensed with, and thus the lamp is materially simplified in its construction. Another advantage of the arched form is that the shadows cast by such a burner is less than that produced by other forms of burners.

We have used such burners in close or hermetically sealed transparent chambers in a vacuum, in nitrogen gas, and in hydrogen gas; but have attained the best results in a vacuum or attenuated atmosphere of nitrogen gas, the great desideratum being to exclude oxygen or other gases which are capable of combining with carbon at high temperatures from the incandescing chamber, as is well understood.

The operation of our improved apparatus will readily be understood from the foregoing description.

We claim as our joint invention:

conductor
Feb. 19, '86. 1. An incandescing [arc]* for an electric lamp, of carbonized, fibrous or textile material, and of an arch or horseshoe shape, substantially as hereinbefore set forth.

[* Words enclosed in brackets erased in copy.]
[Matter enclosed between rules erased in copy.]

Erased Feb. 19, '85. 2. The combination of an incandescing arc of carbon for an electric lamp, of an arch or horseshoe shape, and a transparent hermetically sealed chamber, from which oxygen or other gases capable of combining with carbon at a high temperature are excluded.

3. The combination of an incandescing arc of carbon for an electric lamp, of an arch or horseshoe shape, included in and forming part of an electric circuit, and a transparent hermetically sealed chamber, from which oxygen and other gases capable of combining with carbon at a high temperature are excluded.

---

2. [4.]* The combination, substantially as hereinbefore set forth, of an electric circuit, and incandescing arc of 2824 carbonized paper included in and forming part of said circuit, and a transparent hermetically sealed chamber, in which the arc is inclosed.

Insert A,
Dec. 4, '84.

For signature and witnesses see original specification.

WM. E. SAWYER,
ALBON MAN,
By their attorney, WM. D. BALDWIN.

The above amendments are submitted in view of official suggestions.

Prescott's date of publication is antedated by Sawyer and Man's reduction to practice. The reference is, moreover, inapposite, as it apparently relates strictly to the manufacture of carbon to be used for a voltaic arc, and has nothing to do with incandescing lamps, and no suggestion whatever is made of the invention claimed.

Gardiner and Blossom show a signal lamp with a platinum-wire coil forming an incandescing arc. The form is apparently a mere accident, and the material differs from that of Sawyer and Man, in whose invention both the form and material are essential elements. This reference shows nothing as to a vacuum or air, or other special gases for electric lamps, the platinum being heated in an ordinary atmosphere.

A re-examination of the claims as amended is requested.

Respectfully yours, WM. D. BALDWIN,
Att'y for Sawyer and Man.

May 17, '80.

(Endorsement: Sub. spec. May 17, '80. Amendment Sawyer and Man electric lamp. Filed Jan. 9, '80. U. S. Patent Office, May 17, 1880.)

[* Figure enclosed in brackets erased in copy.]
[Matter enclosed between rules erased in copy.]

2825 Copied.

Room No. 118.

U. S. Patent Office,
Washington, D. C., *May 20th*, 1880.

Electric lamps. Filed Jan. 9, '80. No. 547.

Sawyer and Man, care Baldwin, Hopkins & Peyton, Washington, D. C.:

There is believed to be no patentable novelty in the form of the incandescent carbon conductor, in view of Gardiner and Blossom's patent, the form of the platinum conductor therein shown being essentially an arch or horseshoe, and having all the advantages set forth by app'ts.

Carbon as a material for incandescent conductors is well known.

The 1st, 2d and 3d claims are rejected for the above reasons, the 4th claim will probably be involved in interference.

Sawyer and Man, care Baldwin, Hopkins & Peyton, present:

Please find below a copy of a communication from the examiner concerning your application, No. 547, Jan. 9, 1880, for electric lamps or lights.

Very respectfully,
E. M. MARBLE,
Commissioner of Patents.

2827 & 2828 Room No. —.

Your case, above referred to, is adjudged to interfere with others, hereafter specified, and the question of priority will be determined in conformity with the rules.

The statement demanded by rule 105 must be sealed up and filed on or before the 25th day of October, 1880, with the subject of the invention, and name of party filing it indorsed on the envelope. The subject-matter involved in the interference is, the incandescent conductor for an electric lamp, formed of carbonized paper.

Edison's 1st, Sawyer and Man's 4th claim.

The other party to this interference is T. A. Edison, Menlo Park, N. J. Application filed Dec. 11, 1879. Dyer & Wilber, Washington, D. C., asso. att'ys.

In declaring this interference the objections standing against Sawyer and Man's 1st, 2d and 3d claims are not removed.

H. C. TOWNSEND, *Ex'r.*

Edison's File-wrapper and Contents. May 11, 1886. T. G., Ex'r.

Consolidated Electric Light Co.
vs.
Edison Electric Light Co. *et al.*
} H, 3553.

Department of the Interior,
United States Patent Office.

To all persons to whom these presents shall come, Greeting:

This is to certify that the annexed is a true copy from the files of this office of the file-wrapper, contents and drawing down to December 15, 1880, in the matter of the application filed by Thomas A. Edison, December 11, 1879, for improvement in electric lamps and method of making the same.

In testimony whereof, I, M. V. Montgomery, Commissioner of Patents, have caused the seal of the Patent Office to be [seal.] affixed this 22d day of June, in the year of our Lord, one thousand eight hundred and eighty-five and of the Independence of the United States the one hundred and ninth.

M. V. MONTGOMERY,
Commissioner.

2830 To the honorable Commissioner of Patents:

Your petitioner, Thomas A. Edison, of Menlo Park, in the State of New Jersey, prays that letters patent may be granted to him for the invention of an improvement in electric lamps and in the method of manufacturing the same set forth in the annexed specification. (Case No. 187.)

And further prays that you will recognize Lemuel W. Serrell, of the city of New York, N. Y., as his attorney, with full power of substitution and revocation, to prosecute this application, to make alterations and amendments therein, to receive the patent, and to transact all business in the Patent Office connected therewith.

THOMAS A. EDISON.

Menlo Park, N. J., December 8th, 1879.

2831 UNITED STATES OF AMERICA,
State of New Jersey, County of Middlesex. }

On this eighth day of December, in the year one thousand eight hundred and seventy-nine, before the subscriber, a notary public in and for said State, personally appeared the within-named Thomas A. Edison, and made solemn oath that he verily believes himself to be the original and first inventor of the within-described improvement in electric lamps, and in the method of manufacturing the same, and that he does not know and does not believe that the same was ever before known or used, and that he is a citizen of the United States and a resident of Menlo Park, N. J.

THOMAS A. EDISON.

Sworn to before me, the day and year above written.

S. L. GRIFFIN,
[L. S.] *Notary Public.*

2832 To all whom it may concern:

1. Be it known that I, Thomas Alva Edison, of Menlo Park, in the State of New Jersey, United States of America, electrician, have invented an improvement in electric lamps and in the method of manufacturing the same, of which the following is a specification:

2. In a former application made by me for letters patent in the United States (case 186) an improvement in electric Feb. 17, '80. lamps is set forth, wherein a [filament of]* carbon is enclosed in a glass bulb and the atmosphere removed as nearly as possible, and the carbon is brought to incandescence by an electric current to form the lamp.

3. My present invention relates to an improvement in the process of manufacturing the carbon [filament Dec. 15. and in the means for securing the same to Feb. 17, '80. the conductors.]*

4. Insert "B," per am'd't Feb'y 17, '80. I make use of paper of the desired thickness as free as possible from foreign substances or adulterations and for this purpose I prefer and use "bristol-board." With suitable instruments, such as a punch and die, I cut out a narrow strip of this paper, preferably in the form of an elliptical bow or an arc of a circle, the ends of the strip being by preference wider than the other portions.

5. A number of these pieces of paper are laid flatwise in the bottom of a mold preferably of wrought iron, and there is laid on them a light weight in the form of a flat piece of gas-retort carbon or other device that will not be distorted by the heat. If several of these are laid one on the other in the mould, a piece of tissue paper is interposed between each one and the next.

6. A cover is used to close the mould, and the mould is raised very gradually to a temperature of about six hundred degrees Fahr. This allows the volatile portions of the paper to pass away,

---

[* Words enclosed in brackets erased in copy.]

and at the same time the mould retains the paper in its proper shape, and the paper is prevented from curling up or becoming dis- 2833 torted, as it would be likely to do if the heat were applied suddenly, or the light weight dispensed with.

7. The mould is now placed in a furnace and heated almost to a white heat, and then removed and allowed to cool gradually.

8. The carbon filaments will be found to be smaller than the card-board blanks, and to be sufficiently strong and flexible for handling. The ends of the carbon are to be secured to the metallic conductors in any convenient manner.

9. The carbon filaments prepared as aforesaid are very uniform in their resistance to the electric current, and I make them thin and of a sufficient length to offer a great resistance to the passage of the current.

10. The clamps that connect the conductors to the ends do not require to be pressed with much force on the carbon, because the resistance to the passage of the current between the clamps and the carbon will be less than the resistance of carbon filament, hence but little heat will be developed at the clamps.

11. In ordinary electric lamps the large carbons do not offer much resistance to the electric current, and unless the clamps are very firmly pressed upon the carbon, the current meets with considerable resistance at the clamps and hence heat is developed at such clamps.

---

12. The clamps that I prefer are made of a steel spring tipped at the ends with platina or similar metal; the spring is bent into a circle or bow, and the ends crossed and turned back toward each other similar in shape to the figure 8 with the opening for the carbon between the spring ends at the upper part; the object of this shape is that the pressure of the clamps on the carbon may be increased by the expansion of the spring by the heat of the lamp instead of being lessened, as it would be if the wire was only bent into a single bow.

Substitute "B," per am'd't Dec. 15, '80.

13. The spring clamps are connected to the platina or similar conducting wires by clips, and the platina wires pass through the glass of the globe or bulb that contains the lamp. The air is to be exhausted from the bulb by any suitable 2834 means, and it is preferable to exhaust said air as perfectly as possible, say to the one eight hundred thousandth of an atmosphere.

14. The lamps are suspended or supported in any convenient manner, and the electric current from a magneto-electric machine, or other source of electricity is passed through the lamp, and brings the carbon filament to a high incandescence and the lamp is very durable, and a large number of such lamps can be placed in the electric circuit in multiple arc, or otherwise as desired.

[Matter enclosed between rules erased in copy.]

15. In the drawing—

Fig. 1 is a vertical section of the lamp complete.

Fig. 2 is a side view in large size of the clamping device.

Fig. 3 is a section of the line x x is still larger size.

Fig. 4 is the wire forming one of the clamps before it is bent up to shape.

Fig. 5 is the paper blank before it is carbonized, and

Fig. 6, is a section of the box.

16. The blank *a* is cut out of paper material such as "bristol-board," in the proper shape, the form shown in Fig. 5 is preferred, the same is laid in the metal mold *b*, and when several are laid one on the other, pieces of thin paper are introduced between. The weight *d*, is laid on these; it is to be heavy enough to prevent the paper curling up under the action of the heat, but it allows the paper to contract as the volatile matters are expelled by the heat. This weight *d*, is of gas-retort carbon. The cover *e* is placed on the mold and secured and the mold is heated as before described.

17. The carbon filament *i*, forms the lamp when rendered incandescent by the electric current passed through it.

18. The clamp is made of the wire *h*, at the ends of which are tips or small rivets *r*, of platina or similar material.

2835 19. The wire is bent up and crossed as shown, so as to act as a spring in clamping the end of the carbon filament that is placed within such clamp. The

Dec. 15, '80. wire passes through [is attached to]* a small stock, *o*, into which the conducting wire *t*, passes and is clamped.

20. The conductors for the two ends of the carbon are inserted into the glass and the latter intimately melted around them; the carbon and clamps are connected to the wires and the parts introduced within the neck of the bulb *m*, and the glass melted at *v*, the air is exhausted from the globe by the

Dec. 15, '80. tube *k*, which originally is [that passes away]* as shown by

Insert C, per am'd't Dec. 15, '80. dotted lines but which is [and the tube]* melted together ᴧ while the vacuum is maintained.

21. The lamp is ready for the conductors to be attached to it, and the carbon is rendered incandescent by the current that passes through the same. It is durable as there is nothing to combine with the carbon and it is substantially indestructible.

[* Words enclosed in brackets erased in copy.]

Insert "D," per am'd't Dec. 15, '80.

I claim as my invention,

Substitute "A," per am'd't Jan. 3, '80.

Insert E, March 11, '82.

First. The manufacture of carbons for electric lights from paper.

Second. The method herein specified of manufacturing carbons for electric lights, consisting in exposing the filament of paper to the action of heat in a mold to drive off the volatile portions and carbonize the paper, substantially as set forth.

Erase per am'd't Dec. 15, '80.

Third. A carbon for electric lights made as a filament, with the ends broader for the clamping devices that connect the conductors.

2836 Fourth. The clamp for the carbon of an electric lamp composed of a bow or elliptical spring with the ends crossing each other, and receiving between them the carbon substantially as set forth.

Signed by me, this 8th day of December, A. D. 1879.

THOMAS A. EDISON.

Witnesses:
S. L. GRIFFIN.
J. F. DOWNING.

(Endorsement: U. S. Patent Office, Dec. 11, 1879; case No. $187—\frac{16}{30}$. Dated Dec. 8, 1879; Thomas A. Edison, improvement in electric lamps and in the method of manufacturing the same.)

Case 187.

T. A. Edison, care of L. W. Serrell, box 4689, N. Y. city.

Electric lamps and methods of making the same. Filed December 11, 1879.

Claim 1 is ambiguous, it not being clear whether the claim covers an article or a process. Claim 3 is too broad. The word filament does not distinguish applicant's carbon from others, except in degree.

C. L. BUCKINGHAM, *Ass't.*

H. C. TOWNSEND, *Ex'r.*

(Endorsement: 146-30; 1; rejection, Dec. 30, 1879.)

[Matter enclosed between rules erased in copy.]

2838 NEW YORK, *January* 2, 1880.

Hon. Com. of Patents.

SIR: In the matter of my application, No. 187, for patent on electric lamps, filed Dec. 11, 1879, I amend the specification by inserting after title.

("Case No. 187.")

The first claim is erased and the following substituted:

Substitute "C^2" per "A," am'd't Feb'y 17, '80.	"First. An electric lamp formed of carbonized paper."

The 3d claim is believed to be correct; no other meaning than "thread-like" is known to attach to the word "filament," and this claim is meant to apply to a thread-like carbon with broad ends, and that is believed to be new.

Respectfully yours, THOS. A. EDISON,
Per LEMUEL W. SERRELL, *Att'y.*

(Endorsement: Thos. A. Edison electric light. Case 187; amendment; U. S. Patent Office, Jan. 3, 1880. 146–30. "A." 2. Amendment Jan. 3, 1880. Cancelled.)

2839 To the Comm'r of Patents.

In the matter of my application for patent for improvement in electric lights, No. 187, filed December 11, 1879, I hereby appoint G. W. Dyer and Z. F. Wilber, of the firm of Dyer & Wilber

Associate attorneys to prosecute said application to make alteration and amendments therein, to receive the patent, and to transact all business in the Patent Office connected therewith in my place and stead.

Correspondence to be with them.

Signed at Menlo Park, N. J., this 24th of January, 1880.

T. A. EDISON.

(Endorsement: U. S. Patent Office, Jan. 30, 1880. 146–30; 3. Asso. power of att'y, Jan. 30, 1880.)

2840 Hon. Commissioner of Patents.

SIR: In the matter of my application No. 187 for a patent for "electric light," filed December 11, 1879, I amend as follows:

Cancel amendment of January 3, 1880.

Erase words "filament of" in 11th line, first page.

Erase "filament," line 18, page 1.

Insert after line 19, page 1, "I have found that it is desirable in an electric lamp that there should be a very great resistance in a very small amount of incandescing material.

[Matter enclosed between rules erased in copy.]

B. And that carbon prepared from paper by my process possesses the necessary high resistance.

By using such carbon I am enabled to use an exceedingly small carbon, so small that its dimensions are best expressed by applying to it the term filament, it being thread-like in size."

Erase first claim and insert.

C_2. "First. The incandescent conductor for an electric lamp formed of carbonized paper, substantially as set forth."

It is believed these amendments obviate the office objections.

DYER & WILBER,
Attorneys for Edison.

Feb. 17, 1880.

WASHINGTON, D. C., *September* 23, 1880.

T. A. Edison, care Dyer & Wilber, present:

Please find below a copy of a communication from the examiner concerning your application filed December 11, 1879, for electric lamps, etc., (case No. 187.)

Very respectfully,
E. M. MARBLE,
Commissioner of Patents.

Room No. —.

Your case above referred to is adjudged to interfere with others hereafter specified, and the question of priority will be determined in conformity with the rules.

The statement demanded by rule 105 must be sealed up and filed on or before the 25th day of October, 1880, with the subject of the invention, and name of party filing it, endorsed on the envelope.

The subject-matter involved in the interference is, the incandescent conductor for an electric lamp formed of carbonized paper.

Edison's first claim; Sawyer and Man's 4th claim.

2842 The other parties to this interference are Sawyer and Man, whose application was filed Jan. 9, 1880, No. 547.

William E. Sawyer, New York city.

2843 (Edison, No. 187.)

Room 152.

T. A. Edison, electric lamps. Filed December 11th, 1879.

Hon. Commissioner of Patents:

This application is now in interference with an application filed by Sawyer and Man, as to a part of the subject-matter contained therein only, there being claims and subject-matter not interfering with the claims made by Sawyer and Man, or with any claims which could be made upon the subject-matter shown or described by them.

The application can be legitimately divided.

I have, therefore, determined to take advantage of the provisions of rule 125, cancel by amendment the matter herein adjudged not to interfere, and to file a new application therefor, which application is this day filed and bears my serial number 264, and which is, a-to such matter, a continuation of this application, relating back thereto.

The present application is accordingly amended as follows:

Erase the words "and in the means for securing the same to the conductors," lines 18 and 19, page 1.

Erase from line five, page 4, to line 13, page 5, inclusive, and insert in lieu thereof:

> "In order that not only the improvement in the carbon may be understood, but that the manner of its embodiment
> B. in a complete lamp and its utility may be better understood, a complete lamp and the method of its manufacture will be illustrated and described."

In lines 25 and 26, page 6, erase "is attached to," and insert "passes through."

In line 10, page 7, erase "that passes away," and insert "which originally is."

In line 11, page 7, erase "and the tube," and insert "but which is."

2844 At end of line 11 insert:

C. "When a proper vacuum has been attained."

Before claims insert:

> "It is not intended to claim anything herein shown and described except the incandescent conductor made of paper as all such other matters of invention as are herein shown or

D. described are only shown as incidental to and illustrative of the manner of manufacture and use of the paper carbon, and form the subject-matter of another and separate application for a patent made by me."

Erase all claims except the first.

File-wrapper and Contents of Interference. May 11, 1886. T. G., Ex'r.

CONSOLIDATED ELECTRIC LIGHT CO.
vs. } H, 3553.
EDISON ELECTRIC LIGHT CO. *et al.*

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE.

To all persons to whom these presents shall come, Greeting:

This is to certify that the annexed is a true copy from the files of this office of the file-wrapper and contents in the matter of the interference William E. Sawyer and Albon Man *vs.* Thomas A. Edison, for improvement in electric lamps or lights.

In testimony whereof I, M. V. Montgomery, Commissioner of Patents, have caused the seal of the Patent Office to be [L. S.] affixed this 19th day of June, in the year of our Lord one thousand eight hundred and eighty-five, and of the Independence of the United States the one hundred and ninth.

M. V. MONTGOMERY,
Commissioner.

(Here follow diagrams marked pp. 2849, 2850, & 2851.)

2852 DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
WASHINGTON, D. C., *September* 23, 1880.

(U. S. Patent Office, Sept. 25, 1880, ex'r of interferences.)

To the examiner of interferences:

An interference is found to exist between the cases and in respect to the invention below specified to wit:

228—286

Cases.

Sawyer, W. E., New York city, and Man, A., Brooklyn, N. Y., No. 547, January 9, 1880; Baldwin, Hopkins & Peyton, Washington, D. C., attorneys.

T. A. Edison, Menlo Park, N. J., Dec. 11, 1879, (case No. 187); Dyer and Wilber, Washington, D. C., attorneys.

Claim.

The incandescent conductor for an electric lamp formed of carbonized paper; Edison's 1; Sawyer & Man's 4th claim.

(Endorsement: 7768; 1; declaration of interference Sep. 23, 1880.)

2853 In the United States Patent Office.

William D. Baldwin, Sept. 27, 1880, Washington, D. C.

U. S. Patent Office,
Nov. 11, 1880,
Ex. of interferences.

In the matter of the preliminary interference declared Sept. 22, 1880, between the interfering applications for electric lights of Sawyer and Man, filed Jan. 9, 1880 (case 547), and that of Thomas A. Edison, filed Dec. 11, 1879.

City and County and State of New York, *ss:*

William E. Sawyer and Albon Man, being severally duly sworn, depose and say: We conceived the invention of the subject-matter in controversy, to wit: an incandescent conductor for an electric lamp formed of carbonized paper some time during the month of March, 1878; communicated it to others immediately thereafter, and made numerous experiments in connection therewith continuously until March, 1879; in our experiments we used an incandescing arc of carbon or carbonized material in various 2854 forms; the model accompanying this application is one of numerous machines which were practically used by us, and our experiments were known to many persons.

W. E. SAWYER.
ALBON MAN.

Sworn to and subscribed before me this 28th September, 1880.

THEODORE DE WITT, Jr.,
Notary Public, Rockland County.

WASHINGTON, D. C., *Nov.* 5, 1880.

To the Commissioner of Patents.

SIR: Herewith we file an affidavit of Albon Man in compliance with the official letter of October 25th.

This affidavit is as full a compliance with the official letter as we can now furnish, in view of the facts therein stated.

It is impossible for us, within the time allowed, to furnish an affidavit of Sawyer, as he is absent from home, and we have been unable as yet to ascertain his whereabouts. It is hoped, however, that the accompanying paper will be sufficient.

Respectfully,

BALDWIN, HOPKINS & PEYTON,
Attorneys for Sawyer & Man.

William E. Sawyer and Albon Man *vs.* Thomas A. Edison. } Interference—Electric Lights.

Notice of Motion.

To Messrs. Dyer & Wilber, Washington, D. C., solicitors for T. A. Edison.

Gentlemen: Please take notice that on Wednesday, the 26th day of January, 1881, at the hour fixed by the rules in such cases, I will move to dissolve the above-entitled interference upon the ground that there is not interference between the claims of the contestants; and that in support of said motion I will use the papers on file in the case, including the papers composing the two applications.

Very respectfully,
AMOS BROADNAX,
Solicitors for Sawyer and Man.

Dated January 22d, 1881.

2870 (Endorsement: U. S. Patent Office Jan. 26, 1881:

SAWYER AND MAN
vs.
THOMAS A. EDISON.
Interference. Electric Lighting.

7768. *Notice of Motion to Des-olve.* 12.

Referred to the primary examiner for consideration as provided in rule 116.

J. B. CHURCH, *Examiner.*

26-1-'81.

Due and timely service of the within notice is hereby admitted.

DYER & WILBER,
For Edison.

This motion having been heard it is denied for the reason that while the claim of Sawyer and Man is in the form of a combination, and in terms embraces the carbon conductor enclosed in a transparent hermetically sealed chamber, the specification states that the invention relates especially to the conductor, and that the apparatus is old and well known, and constitutes no part of the subject-matter claimed.

From this it clearly appears that the gist of the alleged invention is in the peculiar conductor, and whether it is used in an old transparent chamber or not, is immaterial to the issue of this interference.

Limit of appeal 20 days.

F. L. FREEMAN, *Examiner.*

January 28, 1881.)

2871 NEW YORK, *January 26th*, 1881.

Honorable Commissioner of Patents:

SIR: In the matter of interference of Sawyer and Man *vs.* Thomas A. Edison on electric lighting, I found on my return from Boston this day, a notice of a motion made by attorney of Sawyer and Man for dissolving the interference and set for hearing this day.

I was not aware of any such interference, and did not know that I was attorney in connection therewith. I cannot make out the name of Sawyer and Man's attorney, and therefore take the liberty of writing and requesting that if any such motion is under consideration, that the hearing may be postponed to such time as will allow Mr. Edison to be represented; I have sent the notice and a copy hereof to Mr. Edison.

Respectfully yours, LEMUEL W. SERRELL.

(Endorsement: U. S. Patent Office Jan. 27, 1881.)

2872 In the United States Patent Office.

SAWYER AND MAN
vs.
T. A. EDISON.
} Electric Lamp Interference.

Upon motion to dis-olve the interference.

This motion having been denied by the primary examiner, an appeal is hereby taken to the Commissioner in person.

The ground of the motion is that there is no interference between the claims of the contestants, and the reason of appeal is that the examiner erred in not granting the motion to des-olve.

The office is respectfully requested to set a day for the hearing of this appeal.

Respectfully submitted.

AMOS BROADNAX, *Attorney.*

Dated February 3d, 1881.

WILLIAM E. SAWYER and ALBON MAN
vs.
THOMAS A. EDISON.
} Interference. Electric Lights.

Messrs. Dyer & Wilber:

Take notice that on February 14th, 1881, I will submit a motion to the examiner having charge of the above-entitled interference that the time for taking testimony be postponed until after the decision of the Commissioner upon the appeal now pending in this matter, as stated in the accompanying affidavit, which will be submitted in support of said motion.

Very respectfully. AMOS BROADNAX.

Dated February 8th, 1881.

WASHINGTON, D. C., *Feb.* 19, 1881.

Good service.

DYER & WILBER,
For Edison.

2875 In the United States Patent Office.

WILLIAM E. SAWYER and ALBON MAN
vs.
THOMAS A. EDISON.
} Interference. Electric Lighting.

CITY AND COUNTY AND STATE OF NEW YORK, *ss:*

AMOS BROADNAX being duly sworn, says: That he is attorney for Sawyer and Man in the above-entitled interference.

That on January 26th, 1881, he moved the primary examiner to dissolve the said interference on the ground that there is no interference between the claims of the applicants.

That on January 28th the said examiner denied said motion. That on February 4th, 1881, deponent filed an appeal *to* the Commissioner in person from the decision of said examiner denying said motion. That no time has yet been set for the hearing of said appeal. That the time limited by the office within which Sawyer and Man should put in their affirmative testimony expired on February 7th, 1881. That no testimony has been taken in the case by either party. That said motion to dissolve was made in good faith, and that said appeal is taken in good faith and not for the purpose of delay, but in the firm belief that there is no interference between the claims of the respective parties. That the two applicants do not in fact claim substantially the same patentable invention as required by rule 93 in such cases; deponent therefore verily believes that the interference as now decreed ought to be dissolved.

Deponent therefore moves the examiner having charge of this interference that the time for taking testimony be postponed until after the decision of the Commissioner upon said appeal, and
2876 that the time for taking testimony be then fixed by the office in case the Commissioner decides that the claims of the applicants do interfere.

Respectfully submitted. AMOS BROADNAX.

Dated February 8, 1881.

Subscribed and sworn to before me this 8th day of Feb., 1881.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
WASHINGTON, D. C., *February* 14, 1881.

In the Matter of the Interference Between SAWYER and MAN *vs.* EDISON ELECTRIC LAMPS.	Interlocutory Appeal.

You are informed that for reasons on file, the decision of the primary examiner is affirmed.

Respectfully,

—— ——,
Chief Clerk for Commissioner.

Sawyer and Man, care Amos Broadnax, 57 Broadway, N. Y. city; Thomas A. Edison, care Dyer & Wilber, present.

(Endorsement: Office to Sawyer and Man *vs.* Edison; notice of decision by Commissioner; February 14, 1881.)

2880 United States Patent Office.

SAWYER and MAN
vs.
EDISON.
} Interlocutory Appeal.

Electric Lamps.

Application of Sawyer and Man filed January 9, 1880.

Application of Thomas A. Edison filed December 11, 1879.

Amos Broadnax for Sawyer and Man.
Messrs. Dyer & Wilber, for Edison.

This is an appeal from the decision of the primary examiner upon motion to dissolve the interference on the ground that there is no interference between the claims of the contestants.

Edison's claim in interference is "the incandescent conductor for an electric lamp formed of carbonized paper."

Sawyer and Man's claim is "the combination, substantially as hereinbefore set forth, of an electric circuit, and incandescing arc of carbonized paper included in, and forming part of said circuit, and a transparent hermetically sealed chamber, in which the arc is enclosed."

In their specification Sawyer and Man say "Our invention more specially relates to an incandescent conductor." In their preliminary statement Sawyer and Man say: "We conceived the invention of the subject-matter in controversy, to wit, an incandescent conductor for an electric lamp formed of carbonized paper, some time during the month of March, 1878."

This is an identification of the invention in the language
2881 of the issue, without it, however, I have no doubt that the
4th claim of Sawyer & Man's application not only does cover, but was intended to cover the subject-matter in interference. It should be observed that it is not necessary that the claims should be in the exact language in all cases where an interference exist-. The thing to be determined is, is the subject-matter, the substance of the invention claimed by both or all parties.

I agree with the examiner that the gist of the alleged invention is in the peculiar conductor, and that an interference exists between the claims of the parties.

His decision is accordingly affirmed.

E. M. MARBLE,
Commissioner.

February 14, 1881.
V. D. S.

(Endorsement: U. S. Patent Office; Commissioner's decision; Sawyer and Man *vs.* Edison; recorded vol. 22, p. 47. February 14, 1881.)

In Re Interference SAWYER AND MAN *vs.* EDISON.	Before the Examiner of Interferences.

Subject-matter: Electric lamps or lights.

Sawyer and Man, care Amos Broadnax, 57 Broadway, N. Y. city;
Thomas A Edison, care Dyer & Wilber, Washington, D. C.:

No day of hearing is fixed in the within motion and as the filing of a motion to dissolve does not *ipse facto* suspend proceedings in the case, rule 117, a motion showing good cause for delay must be made before an extension can be granted.

J. B. CHURCH,
Examiner of Interferences.

(Endorsement: 7768; 15; office to Sawyer and Man and Edison; Feb. 23, 1881.)

2883 In the United States Patent Office.

WILLIAM E. SAWYER and ALBON MAN *vs.* THOMAS A. EDISON.	Interference. Electric Lighting.

Messrs. Dyer and Wilber:

GENTLEMEN: Please to take notice that on Tuesday, March 1st, 1881, at one o'clock in the afternoon of that day I will submit this motion to the examiner of interference in the United States Patent Office, for such an extension of time to put in the testimony in this case as to him may seem reasonable; and that in support of this motion, I will submit an affidavit of which the annexed is a copy.

Very respectfully, AMOS BROADNAX.

Dated February 25th, 1881.

Good service.
February 26, 1881.

DYER & WILBER,
For T. A. EDISON.

2884 In the United States Patent Office.

WILLIAM E. SAWYER and ALBON MAN *vs.* THOMAS A. EDISON. } Interference. Electric Lighting.

Motion for Time to Take Testimony.

CITY AND COUNTY OF NEW YORK, *State of New York,* } *ss:*

Amos Broadnax being duly sworn says: That he is attorney for William E. Sawyer and Albon Man in the matter of the above-entitled interference. That on January 26th, 1880, deponent moved the primary examiner in charge of said interference to dissolve the same. That on January 28th, 1880, said motion was denied, and that the decision was on February 15, 1881, sustained upon appeal to the Commissioner in person.

Deponent says that said motion was made, and appeal taken in good faith, upon the ground that there was and is no interference between the claims of the applicants, to which opinion deponent adheres; that said motion was not made for the purpose of delay or for the purpose of avoiding the interference; but was made solely that deponent might have an opportunity to amend the specification and claim of Sawyer and Man for the purpose of putting the claims of the applicants in interference that the issue might be fairly made and settled before the taking of the testimony.

Deponent has no desire to delay the interference and would have put in the affirmative testimony of Sawyer and Man within the time fixed by the office, but for the reason alone stated, viz: that he desired to amend the specification and claims before taking the testimony. But deponent's motion having been overruled
2884½ he prays for such time to take testimony as to the examiner may seem just and reasonable.

Deponent further says that he did not come in this case as attorney until December 9th, 1880, and has since moved in this case as fast as his professional engagements, and the sickness and death of one of his children, would permit.

Wherefore deponent prays for reasonable time to put in the testimony on behalf of Sawyer and Man.

Respectfully submitted.

AMOS BROADNAX. *Attorney.*

Dated February 25th, 1881.

Subscribed and sworn to before me this 25th day of February, 1881.

WM. H. BROADNAX,
[SEAL.] *Notary Public, Kings County, N. Y.*

Certificate filed in N. Y. Co.

2891 COMPLAINANT'S EXHIBIT PATENT OFFICE PROCEEDINGS No. 3.

Edison's Petition to Amend Preliminary Statement. May 11, 1886.
T. G., Ex'r.

CONSOLIDATED ELECTRIC LIGHT CO. *vs.* EDISON ELECTRIC LIGHT CO. } H, 3553.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE.

To all persons to whom these presents shall come, Greeting:

This is to certify that the annexed is a true copy from the files of this office of the petition for permission to amend preliminary statement and accompanying affidavits filed in behalf of Edison in the matter of the interference, Sawyer and Man *vs.* Edison, for improvement in carbons for electric lamps.

In testimony whereof I, M. V. Montgomery, Commissioner of Patents, have caused the seal of the Patent Office to be affixed this 19th day of June, in the year of our Lord one thousand eight hundred and eighty-five, and of the Independence of the United States the one hundred and ninth.

[L. S.]

2892

M. V. MONTGOMERY,
Commissioner.

SAWYER AND MAN *vs.* T. A. EDISON. } Interference. Carbons for Electric Lamps.

To the Commissioner of Patents:

In the above-entitled interference, I respectfully ask leave, under rule 110, to amend my preliminary statement by striking out "Nov. or Dec., 1878," and inserting instead thereof "September, 1887."

THOMAS A. EDISON,
Per DYER & WILBER, *His Att'ys.*

To Amos Broadnax, Esq., att'y for Sawyer and Man.

SIR: Please take notice that the above petition, and the accompanying affidavits and exhibit will be filed immediately, and that the petition will be heard at such a time as the Commissioner of Patents may set.

DYER & WILBUR, *Attorneys.*

June 20, 1881.

2893 STATE OF NEW YORK, *City and County of New York,* } *ss:*

I, Thomas A. Edison, on oath declare and say as follows:

I am the Thomas A. Edison who is a party to the interference of Sawyer and Man with myself upon the subject of incandescent conductors for electrical lamps, made of carbonized paper.

When I made the preliminary statements in this interference I was excessively absorbed in business, my time being devoted to the making of numerous inventions in connection with my system of electric lighting, and in the introduction of the same commercially, having under my direct charge over one hundred men looking to me for orders and instructions, and besides engaged in my telephone interferences, and being overrun with visitors day and night. My memoranda of exhibits were several thousand in number and had been much confused by the disturbance of them in finding material for my telephone interference. When, therefore, I made my preliminary statements I did so under all the disadvantages mentioned, and relied almost wholly upon my memory of occurrences, and absolutely forgot the fact of the use of the lamp in 1877, which I desire to include in my preliminary statement, and did not recall the same until Saturday, June 11th, 1881, when, in conversation with Charles Batchelor, he recalled the same to my recollection, and in testimony that day I stated that I thought I had the lamp of 1877, before mentioned, at Menlo Park, and would make search for it, which I did on the next day and found the same, and produced it in testimony of Monday, June 13th, 1881, and it is marked as an exhibit as "Edison's Exhibit First Incandescent Lamp."

I have a distinct and positive recollection of using such lamp in September, 1877, with an incandescent conductor of carbon- 2895 ized paper, and such recollection is made certain by paper exhibits of electric lights, dated November and December, 1877.

I declare that the facts sought to be inserted by amendment in my preliminary statement were omitted through inadvertence or mistake, and that the desired correction of the preliminary statement is essential to the ends of justice.

The lamp referred to as used in 1877 is the earliest existing embodiment of my invention in this interference, and without its use I shall be denied testimony which I am advised is most important. I append a sketch of said lamp.

THOMAS A. EDISON.

Subscribed and sworn to before me this 18th day of June, 1881.

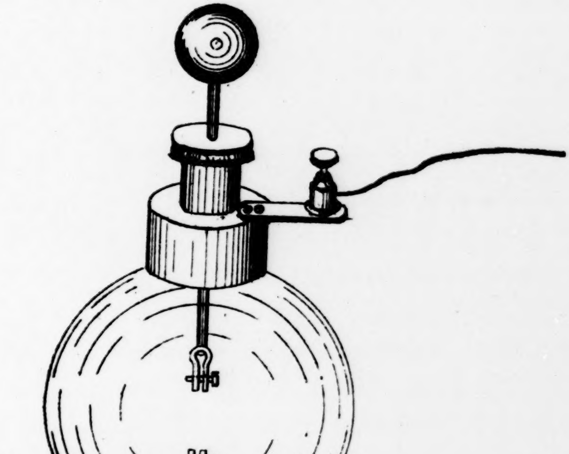
McK Light Co.

p. 2894



2896 STATE OF NEW YORK, }
City and County of New York, } *ss:*

I, Charles Batchelor, on oath declare and say as follows:

I have been associated with Thomas A. Edison for the past eleven years, and have assisted him in experimenting upon and developing all of his important inventions made in that time. At the time the preliminary statements of Mr. Edison in the interference of Sawyer and Man *vs.* Edison on paper carbons for incandescent electric lamps were prepared, I was excessively busy overcoming difficulties we had met with in the details of manufacturing the lamps in the lamp factory at Menlo Park, and was not consulted in regard to the experiments on paper carbons, and did not know what said statements contained until I was informed on Saturday, June 11th, 1881, by Col. Dyer, Mr. Edison's counsel. In discussing the matter on the morning of that day with Col. Dyer and Mr. Edison I was relating the experiments made by Mr. Edison on paper carbons for incandescing electric lamps, as I recollected them, and I stated that we had used paper carbon in an incandescing electric lamp about September, 1877. Col. Dyer replied that such could not be the case since that fact was not set forth in the preliminary statement. In the discussion that followed both Mr. Edison and myself recollected that a lamp made of a "Gassiot cascade" had been used in the experiments of that year. I assisted in the search for the lamp the next day at Menlo Park and found the same. I recognized it as being the apparatus used in September, 1877, for the reason that the changes in construction which had to be made to adapt it for the experiments were made personally by myself at the suggestion of Mr. Edison. I constructed clamps for receiving the ends of the carbons, and also provided the apparatus with binding posts to secure the ends of the conducting wires, and in the experiments I prepared the paper carbons and put them into the lamp personally.

2897 After we made the experiments in September, 1877, I don't recollect that the lamp was used in any other experiments, but I think it must have been laid away among other apparatus and not afterwards noticed.

I know that at the time the preliminary statements of Mr. Edison were prepared he was very busy and under constant strain. He often worked with me all night at the lamp factory, and had besides under his direct charge the arrangement of a large number of other details connected with his system of electric lighting, on any one of which he could have devoted his whole time. He was also greatly annoyed by a large number of visitors.

CHARLES BATCHELOR.

[L. S.]

2898 STATE OF NEW YORK, } ss:
County of New York, }

Z. F. Wilber, being duly sworn, deposes and says that he is of the firm of Dyer & Wilber, attorneys and solicitors of patents; that he has had charge of the prosecution of the applications for patents relating to electro lighting of Thomas A. Edison for the past year and a half nearly.

That he drew up the preliminary statement for Mr. Edison in the interference, Sawyer and Man *vs.* Edison, upon the carbon made of paper

That at that time (viz., October and November, 1880,) Mr. Edison was exceedingly busy, having a large force of men employed whom he had to supervise, being engaged constantly in experiments and tests, and engaged also in the telephone interferences, so that it was almost impossible for him to give any attention to other matters, and almost impossible for him to obtain the conferences necessary to a proper conduct of this business. His records, drawings, etc., of which he has a vast number, were disarranged by the searches made through them for data and exhibits for the telephone interferences.

Under such circumstances the preliminary statement filed in this case was prepared.

The error therein was one entirely of "inadvertence or mistake," and one exceedingly liable to occur under such circumstances. I was entirely unaware that an error had been committed until the morning of the 15th of June, 1881.

Z. F. WILBER.

SAWYER AND MAN
vs.
THOMAS A. EDISON.
} Interference. Electric Lights.

Testimony on Behalf of Sawyer and Man.

Amos Broadnax, counsel for Sawyer and Man, to Dyer & Wilber, attorneys for T. A. Edison.

GENTLEMEN: Please take notice that on the fourteenth day of March, 1881, at two o'clock in the afternoon of that day, at my office, No. 57 Broadway, in the city of New York, I will proceed to take the depositions of Albon Man, 118 Putnam avenue, Brooklyn, New York; William E. Sawyer, 200 West Forty-second street, New York city; William Sawyer, Earle's hotel, New York city; George W. Sawyer, American house, Boston, Massachusetts; William H. Church, 150 Clinton street, Brooklyn, New York; Lawrence Meyers, Plainfield, New Jersey; Jacob Hays, 13 East Fifty-fourth street, New York city; Hugh McCullock, Washington, D. C.; Mr. Arnoux of the firm of Arnoux & Hochhausen, 127 East Twentieth street, New York city; H. L. Judd, 87 Chambers street, New York city; Frank Holebrook, School of Mines, Columbia college, New York city; E. L. Hays, 243 Broadway, New York city; and Amos Broadnax, 57 Broadway, New York city; to be used upon the hearing of this interference on behalf of Sawyer and Man, and you are invited to be present and cross-examine.

Very respectfully, AMOS BROADNAX.

Dated March 8, 1881.

2912 In the United States Patent Office.

WILLIAM E. SAWYER and ALBON MAN
vs.
THOMAS A. EDISON.
} Interference. Electric Lighting.

NEW YORK, *March* 14, 1881.

Parties meet pursuant to the foregoing notice.

Present: Amos Broadnax, counsel for Sawyer and Man, and Dyer & Wilber, for Edison.

ALBON MAN, a witness produced on behalf of Sawyer and Man, being duly sworn and interrogated by counsel, deposed as follows:

1 Q. What is your name, age, residence and occupation?

A. My name is Albon Man. I am a lawyer by profession; I reside in Brooklyn, New York; and I am 54 years of age.

3 Q. State whether you are the Albon Man, joint inventor with William E. Sawyer, one of the parties to this interference.

A. Yes, sir; I am the same person.

3 Q. In a letter from the Patent Office, dated Washington, Sep-

tember 23, 1880, addressed to Sawyer and Man, care of Baldwin, Hopkins and Peyton, signed by Commissioner of Patents, the subject-matter involved in this interference is stated to be "The incandescent conductor for an electric lamp formed of carbonized paper." Please to state whether or not you and William E. Sawyer are the joint inventors of that subject-matter, and state when it was that you made the invention.

2913 A. We are the joint inventors. We made the invention in the winter of 1878; the first conception of it I should say was in the month of January; cannot be certain as to the exact day or month earlier than the early part of the month of March, 1878. At that time we were at work at a place in Centre street, in New York, near Pearl street, and there and then made our first experiments in the use of carbon made from paper for the incandescing portion of the electric light. The subject-matter had been one of discussion between us for some time before the experiments were attempted.

4 Q. State, if you please, how you made the carbons and of what form they were after they were made.

A. We made the carbons in two different ways—or three. The first were carbonized by the heat of the electric current, the paper being fastened between two conductors and filled with plumbago in some cases and in some cases with mineral salts. The first experiment was in the open air, subsequent experiments in a reservoir of hydrocarbon gas, and probably, although not positively, in a reservoir of hydrogen, also in a reservoir of nitrogen; the reservoirs being of glass and sealed up; the metallic conductors to which the paper was affixed passing through to the interior of the reservoir in which the gases were contained. Another method of manufacture was to place the paper in an iron box in powdered gas carbon, close the box and heat the whole in fire. The form of the papers were various; some of them simple straight strips of paper; some of them were strips of paper cut into an arch form and inserted edgewise between the metal conductors; some of them were bent in an arch form and inserted flatwise between the conductors. "A" in drawing Figs. 1, 2 and 3 of the application for patent represents the form where the paper was cut into an arch. Where the paper was straight, without being cut into arch form, it was sometimes tied to the conductors with wire and sometimes inserted in slits in the tops of the conductors and packed with powder carbon to

2914 make connection with the conductor; sometimes fastened between clamps formed by binding screws passing through the heads of the metal conductors.

5 Q. State, if you please, when it was that you first made carbon burners for sealed electric lamps in the manner you have described in your last answer.

A. Early part of the month of March, 1878.

6 Q. In making your carbon burners in a metal box as you have described, please to state what kind of a box you used, and how you prepared the paper, and placed it in the box, and secured it before putting it into the fire.

A. I had two or three boxes; one was of Russia sheet iron; another of cast iron; and another of sheet tin, which was burnt up; I sifted the powdered gas carbon into the bottom of the box for some little thickness (about ¼ or ½ in depth of carbon), pressed it down with a smooth follower, laid the paper on top of the carbon, sifted in more carbon on top of it, put in more layers of paper, pressed the whole down, repeating the operation until I got as many papers as I wished to carbonize, filled up the box with powdered carbon, tied down the cover with wire, and put it in the fire, keeping it there two or three hours; in one instance I remember leaving it in the fire all night.

7 Q. What were the conditions of the carbons when you took them from the boxes?

A. Thoroughly carbonized. It was quite fragile.

8 Q. And of what form?

A. Same form as paper; some in straight strips; some in bent pieces and some in flat arches. I have been so far describing what we did in the month of March, and from that time on forward to about the latter part of May or the first of June, 1878.

9 Q. Were these pieces of paper that you say you put in the iron box to carbonize cut to the form that you wanted the burner to be before you put them in the box for carbonization?

2915 A. Some of them were and some of them were not; some were cut after carbonization into the form we desired.

10 Q. Please to state what form you made the paper before carbonization, and what form you made the carbon burners after carbonization.

A. In some cases we cut the paper into the form of a flat arch before the carbonization; in some cases the paper was bent into the form of an arch and inserted edgewise into the carbon before carbonization, and in some cases we cut flat arches out of the carbon made from the paper, and in some cases we left the paper simply a straight strip so that when carbonized it would be a proper shape to put straight across between the conductors.

11 Q. Then, as I understand you, you would have in the one case an arch of paper presenting a flat surface as the end of the arch, and in the other case the flat surface would be the top and sides of the arch?

A. Yes; in the one case the flat surface of the paper represents the arch, and in the other the edge of the paper represents the arch.

12 Q. Please to describe now what, if any, preparation you gave to the paper before carbonizing it.

A. Before carbonizing the first time we filled the paper sometimes with a solution of white loaf sugar and sometimes with Canada balsam, and after carbonizing the first time we soaked the carbon produced in solution of loaf sugar sometimes, and sometimes in Canada balsam, and recarbonized it; repeating the operation several times in some instances; in other cases we did not treat the paper at all before carbonization; this was in the preparation of the carbon which was made in the furnaces; in the preparation of the carbon made with the electric current, in order to make the paper a conductor,

we coated it with graphite or plumbago, and sometimes soaked it in solutions of different metallic salts and dried it; the latter
2916 process did not seem to work well; paper filled with plumbago worked the best.

13 Q. State, if you please, when it was that you first used the carbon burners you have been describing in the sealed electric lamp.

A. In March, 1878.

14 Q. Can you state at what time in March, 1878?

A. Between the 1st and 15th; I can't give the date.

15 Q. How did you secure the carbon section in the metallic conductor that carried the current into the chamber of the lamp?

A. In several ways; sometimes it was held in position by being placed between the ends of the metallic conductors, resting upon a small ledge or inequality in the conductor, and kept in place by the spring of the two conductors towards each other; in some cases the ends of the conductors were split or slotted, and the carbon or paper inserted in the slit; in some cases the carbon was held by binding screws put through the ends of the conductors; in some cases by binding screws put through the ends of the conductors to close them together where they were split; in some cases by binding screws and clamps, as represented in the drawing accompanying this application for patent.

16 Q. I understand you to say, in answer to question 15, that in some cases the carbon section of the conductor was held by the spring of the two ends of metal conductors towards each other; were there any instances in which you held the two ends of the carbon section between the divided ends of the conductor by the spring of the metal upon the carbon where the ends of the conductors were divided?

A. I have already stated that there was, or intended so to state; and that we improved the electrical connection between the metal and the carbon by packing powdered carbon between the two at the connection; I should also add that we bound the carbon in some instances to the metal conductors with fine wire, and
2917 sometimes we wound wires around the clamps that held the carbon, to bind it in place.

17 Q. Please to state what further treatment you gave the carbon before you put it into the lamp?

A. After it was placed between the metal conductors we put it in a sealed reservoir of hydrocarbon gas, or a reservoir through which hydrocarbon gas was passing; the reservoir being of glass so that we could observe what was going on; we then turned on the current of electricity gradually and heated up the carbon while it was in the bath; first to about a good white heat, and afterwards to high incandescence; continuing it so long as to perfect the carbon by rendering it uniform in resistance by deposit of carbon from the gas which went on under these conditions, at the point or points of highest resistance first, and subsequently over the whole carbon; I have been speaking thus far of only what took place up to the 1st of June or last of May, 1878; we had no convenience for working from that time up to September, and our experiments were renewed in September, and continued on until late in March, 1879; early in the month of October, 1878, we prepared paper carbons in the manner I have described by carbonization, in the furnace at the corner of Elm and Walker streets in this city, and perfected them substantially as I have described, and used them during the month of October and the following months until the latter part of March, 1879, in electric lamps, at that place, successfully, and exhibited them to great numbers of people; the form of the carbons which we then used was that of a circular washer such as is shown in the lamp accompanying the application of this patent as a model; after the carbon was inserted in the clamps, the lower section of the circle between the conductors was cut away; we used different kinds of paper of great variety, but principally ordinary blotting paper; we used willow carbon; boxwood carbon; maple carbon; 2918 dogwood carbon; these I am speaking of were used both in the form of an arch and in straight pencil; some of them were rubbed down and worked out by hand after being treated, and some of them were not; we turned these circles also out of all kinds of carbons on the lathe, and treated them all as I have described electrically to perfect them.

18 Q. Please to state what part or parts of the invention and experiments were made of which you have been testifying previous to the 15th of March, 1878, and state what was done after that and down to the month of October or November, 1878, in the order, as near as you can, of its being done.

A. We prepared the paper carbon first electrically, and subsequently by carbonization in the furnace in March, 1878; and from that time on to May continued our experiments with it; we treated it during this period in the hydrocarbon bath; improved it by soaking in sugar, etc., and recarbonization. In September, 1878, we commenced the use of oils in connection with the electric current in the preparation of carbon. In October, 1878, we carbonized the complete paper circles or washers, and also straight pencils of paper with better success than before; that is, having better appliances for the work. I think the first lamps we exhibited with paper were in October, 1878; we had others before that, but did not exhibit them; we first had an electric lamp fitted with a carbon burner, made of paper, in March, 1878.

19 Q. That lamp that you say you had fitted with a carbon burner, made of paper in March, 1878, did you apply the electric current to it and test its practical operation?

A. I did.

20 Q. And was it successful?

A. To a certain degree, yes; it was not what lamps have since been made, or what we have subsequently made; not as good as those we made in October. But it was a very satisfactory experiment, and one that I considered well worth continuing and 2919 working up, and one which I did work up. The difficulties were not with the carbon, but with the other appliances of the lamp, its atmosphere, etc.

21 Q. Then, as I understand you, there was no objection to the burner made of the paper carbon?

A. Yes, there were objections at first; it was too fragile; it was not good enough conductor for the electro-dynamic machine which we used. The burner had too high resistances. When carbonized with the current it was liable to crack and to break from contraction. But it had advantages at the same time, which we were trying to secure and were working for. When made of pure cellulose it was a pure carbon, which we were trying in every way to obtain. This is why we kept working at it and finally succeeded in overcoming all its objections.

Counsel for Sawyer and Man gave notice to counsel for Mr. Edison that upon the hearing of this cause he will use the office letter referred to in question 3 of the preceding examination in evidence.

22 Q. State, if you please, what further preparation, if any, you gave the paper before carbonizing it.

A. We consolidated it by pressure in hydraulic press and also in moulds, before carbonizing, and cemented and pressed several sheets together, sometimes.

Cross-examination of ALBON MAN, March 15, 1881, by GEORGE W. DYER, Esq., counsel for Mr. Edison:

23 X Q. What part did you take in the preparation of the application of Sawyer and Man, involved in this interference?

A. I united in making the application with Mr. Wm. E. Sawyer, and in giving the information to the attorneys by whom the application was prepared.

2920 24 X Q. Was the application, as prepared and executed by Mr. Sawyer and yourself, satisfactory to you?

A. It did not cover all I wanted it to, nor was it altogether in the form I wished.

25 X Q. Wasn't it within your power to have it made to suit you?

A. It might have been, but I thought it advisable to have it sent in as it was.

26 X Q. Why advisable to have it sent in in an unsatisfactory condition?

A. For one reason, to get it into the Patent Office immediately; for another, I was informed it could be amended after it should be filed.

27 X Q. Why was it desirable to file it immediately?

A. In order to keep others from obtaining patents for what are considered to be our invention.

28 X Q. By others, do you refer to any one in particular?

A. I think one in particular, and others, of whom we were informed, attempts were to be made to acquire patents.

29 X Q. Who was the one you had in mind?

A. Mr. Edison, the other party to this interference.

30 X Q. Before you made your application in this interference, had the subject of Mr. Edison's inventions in electric lights, and his experiments with lamps, using carbonized paper, been written about in the newspapers considerably?

A. I can't be positive as to dates nor particulars, but I should think it had.

31 X Q. Have you any present recollection of reading any such newspaper articles before your application was filed?

A. I read almost everything I saw in newspapers on that subject, and I think probable I might have read concerning Mr. Edison, what he had done or intended doing.

32 X Q. Were you a party to any proposition to withhold the filing of your application in this interference upon the receipt of a certain sum of money?

2921 A. No, sir.

33 X Q. And never authorized Mr. Cheever to speak for you in that particular?

A. No, sir; I took great pains to see that it was properly filed.

34 X Q. Referring generally to your testimony with regard to the first experiments in the use of paper carbon for electric lamps, did the suggestion for the use of paper for carbon for such purposes come from you or from Mr. Sawyer?

A. I can't tell, we talked over the matter generally, and I can't say which first spoke of it; we were at work on the subject, discussing the matter every day.

35 X Q. Were the forms of carbon represented by your Exhibit No. 1 already attached to Mr. Church's deposition any of them your suggestion, and if so, which; and please designate Mr. Sawyer's suggestions?

A. I can't say now which suggested particular forms because we were working together and was a matter of hourly discussion between us.

36 X Q. When did you and Mr. Sawyer first come together?

A. In January, 1878.

37 X Q. Where and under what circumstances?

A. First at my house in Brooklyn, by the introduction of a gentleman by the name of Hayes; the circumstances were, this gentleman having heard me talking of electricity and electrical lights, and having formed the acquaintance of Mr. Sawyer, he brought him to see me; possibly Mr. Church was with him when he came to see me.

38 X Q. If after that you made a business connection with Mr. Sawyer, when was it?

A. Within a very few days I made an arrangement with Mr. Sawyer to furnish him money to go on with experiments in producing incandescent lamps. Shortly afterwards, and in the month of March, I found that I was continually making suggestions
2922 to Mr. Sawyer, devising apparatus and taking as much part
in producing the lamps as he was, and that Mr. Sawyer could evidently not be the inventor of my apparatus, and we were so mixed up as not to know who made the original suggestions at that

time as to what we were doing. Our agreement was therefore then modified; that we should go on to work together, each submitting to the other any ideas that occurred to him, and if upon joint discussion and modification it seemed desirable to go on with any particular thing we would do so, and take out the patents in our joint names. Thus we did.

39 X Q. Was it the spirit of that agreement that there should be joint applications for improvements in electric lamps where the subject-matter had been discussed between you?

A. Not unless it was our joint work; if our joint work, yes.

40 X Q. Still I understand under this modified agreement you furnished the money for the experiments?

A. I did.

41 X Q. Did you take a lease of the shop or rooms on Centre street where experiments were first made?

A. I paid for them, but cannot remember whether he or I made the arrangements.

42 X Q. Have you any memorandum or account which would enable you to fix certainly the day when you moved into the place on Centre street? If so have the kindness to produce it at a convenient time.

A. I have, and will produce it. We moved there on the 6th or 7th of February, of that there is no doubt.

43 X Q. Calling your attention to the early experiments at the place in Centre street, state how many lamps you made at that place to the best of your recollection.

A. I can't give the number; have no recollection other than that there was a considerable number of different lamps. The largest
number I should limit it at would be thirty or forty, and
2923 smallest twenty. The same lamps being taken down and
modified several times.

44 X Q. Where did you get the lamps?

A. Made them.

45 X Q. What were they made of?

A. A great variety of things, we used for adaptation a great number of forms of glasses which we bought from a great many places; round-bottom soda bottles; Florence flasks; glass tubes closed by metal at both ends; glass tubes like test tubes of a variety of sizes; seed bottles, oil-sample holders, etc.

46 X Q. What kind of bottles or tubes did you use in the first instance?

A. Florence oil flasks.

47 X Q. What electrical power did you have at Centre street?

A. One of Arnoux & Hochhausen's large machines which they call "light" machines; a smaller one of Arnoux & Hochhausen's; one of Weston's and one of Fuller's, I think.

48 X Q. Do you know the power capacity of these different machines?

A. No, sir.

49 X Q. How many lamps were you in the habit of running upon the same circuit?

A. The largest number, I think, was eight; usually ran but one.

50 X Q. How long did you ever run eight lights continuously at that shop?

A. I should think probably a week.

51 X Q. Night and day, right along?

A. No; we ran none continuously for a week; but ran them for several hours continuously; we were troubled for power.

52 X Q. Calling your attention to the use of paper, how was your attention called toward paper for carbonization?

A. We had great difficulty in getting carbon at all suita-
2924 ble for our purpose, and after we got it we had to shape it by
hand; we had been getting mostly regular electric light carbons, and also carbon used in galvanic batteries. Among others, we got hold of some in thin sheets or strips; we undertook to cut out from those sheets forms shown in Figs. 1, 2, 3, 4 and possibly 5 of Sawyer Exhibit No. 1. They were very difficult to manufacture, and we would not get one in a great number which was good enough to use; we therefore attempted to manufacture the carbon for ourselves, and I think that thin sheets of carbon first suggested to our minds the use of paper in sheets and carbonized in place. Another thing which led to it perhaps was the desirability of using very small carbon, very thin or tenuous, irrespective of its shape, and paper seemed to furnish the readiest means of getting at this; besides furnishing a pure carbon, a great desideratum with us, *i. e.*, certain kinds of paper.

53 X Q. Calling your attention to the very first experiment with the paper carbon, what kind of paper did you use?

A. Very first experiment was made on Sawyer's writing desk in the open air with common writing paper covered with black lead-pencil marks, and the two wires of the machine brought down upon the sheet to make the connection.

54 X Q. What was the result of that experiment?

A. The filling of the paper with black lead was imperfect; we could only get sparkling on the surface of the paper; our machine had not great electrical force, and it had too much resistance. We then got some pure graphite to use instead of lead pencil, to get a better conduction. Experimented in a similar manner with that. The paper was burnt up—that is, destroyed.

55 X Q. What was next experiment in the same direction?

A. After we had succeeded in getting the current through the
paper we then took paper similarly prepared and put it in
2925 the lamp, where it would not be destroyed. The lamps were
filled with hydrocarbon gas; the air had been exhausted.

56 X Q. Was this a sheet of paper coated with graphite or plumbago referred to in the previous answer?

A. Yes, sir; a form cut out of a sheet of blotting paper, coated and filled with graphite or plumbago.

57 X Q. Put in a bottle?

A. Yes, into one of our lamps—probably a Florence flask filled with hydrocarbon or burning gas—common illuminating gas.

57½ X Q. Use a cork stopper?

A. No; cemented to the neck of the bottle was a brass ring over which screwed a brass cap, through which cap one of the conductors was insulated, and the other conductor fastened to the cap.

58 X Q. What was the size of this piece of paper?

A. Should think about 1/8 in. in width and long enough to reach from the two holders, perhaps 3/4 of an inch long, and thickness of ordinary blotting paper, or a little thinner, on acount of being pressed and pounded.

59 X Q. How did you coat or fill it with graphite or plumbago?

A. We soaked it in water in which graphite was suspended and took it out and put it in powdered graphite; rubbed it with graphite till it was polished like a stove; then rubbed graphite in it, as much as we could; then dried it; then pressed it; then used it as I have indicated. Don't recollect whether it was pressed before or after it was dried.

60 X Q. Now, how did you carbonize it? With what amount of current and of how long duration?

A. With the current—how much I don't know. Had great difficulty in getting current through it with small machine we had been using; had to force the machine in order to get it through by short circuiting and by making and breaking the current. This was tried a large number of times by us before we could accom-
2926 plish the object of getting the paper carbonized, and therefore I can't remember the length of time which the current was on.

61 X Q. Please give an account of the first experiment when you did succeed in carbonizing the paper suitably?

A. My previous description of the preparation of the paper is applicable to this experiment. We had placed the paper at first straight across the tops of the holders. Its shrinkage when carbonized would break it; so we placed it in this experiment in a loop between the holders and rising above. We succeeded in carbon-zing the paper in this way so as to get a light for a short time and only for a short time, lasting only three or ten minutes. We tried afterward—or before, I can't be certain—paper soaked in mineral salts to make it a conductor. We succeeded in getting current through it and possibly carbonized it; I can't say positively; I considered it a poor way to do, as the oxygen of the salts would consume the paper, and the minerals left were an impurity in the carbon. I considered the graphite method of obtaining carbon a practical method under proper conditions and with great care. We succeeded sometimes, but rarely; much oftener failing.

62 X Q. In regard to those carbons which you said gave light from three to ten minutes, what was the cause of the light failing?

A. The shrinkage of the carbon, I think, and the impurity of our gases, and our insufficient means of experimenting. The result would be that the carbons would burn up or break—the light would, at all events, go out.

63 X Q. Please to describe when and how you made carbon which was satisfactory?

A. When we began to carbonize the paper in boxes as I have described in my direct examination.

64 X Q. When was that?

A. It was in Centre street, some time about the middle of March—perhaps earlier—perhaps later.

2927 65 X Q. Who was engaged beside yourself and Mr. Sawyer upon these experiments?

A. We were the chiefs—we gave direction to them, and did most of the work ourselves. Mr. Sawyer's father aided us in it.

66 X Q. They were, I understand you, carried on by day?

A. Yes, sir; although I took home some of the prepared paper and carbonized it at my house.

67 X Q. As I understand you the first box you employed was made of sheet iron?

A. No, sir; I think a box made of cast or wrought iron, which old Mr. Sawyer got up from some old thing around the shop.

68 X Q. How large a box was it?

A. About 3 x 4, 2 in. high.

69 X Q. What kind of a box was it which you took home?

A. That one.

70 X Q. In what way did you heat it after you got it home?

A. Put it into a cooking-range fire.

71 X Q. How long did you leave it there?

A. In one instance all night; in another instances until I had retired.

72 X Q. Would the box be heated red hot?

A. Yes, sir; the whole thing and contents heated red hot.

73 X Q. Was the first carbonizing which you regarded as successful done in your house?

A. Don't know whether there or in Centre street. We used the same box for carbon-ing horn.

74 X Q. Put horn and paper in together?

A. My impression is that we did.

74¹ X Q. Was this paper, in the experiments last described, subjected to the previous and subsequent manipulations described in your testimony-in-chief?

A. Yes, sir; some of it was, at least.

2928 74² X Q. That which was satisfactory, I understand you say?

A. Both that which was treated in other ways than by carbonization, and that which was not otherwise treated and by carbonization, was a satisfactory quality of carbon, but I considered that which was treated with sugar, balsam fir, oils, etc., and recarbonized and treated with the electrical current in hydrocarbon bath, as improved by the treatment.

74³ X Q. What proportion of those carbonized in the boxes while you were at Centre street were good, and what proportion were bad?

A. Some were good and many were bad.

74⁴ X Q. Referring now to the experiment you made with carbonized paper in an electric lamp while you were at Centre street, when was the first experiment in which light was produced in the carbonized-paper conductor in an electric light?

A. To the best of my recollection between the 6th and 15th of March.

74^5 X Q. How long did that experiment last?

A. But a few moments at a time.

74^6 X Q. What was the result at the end of a few minutes of operation?

A. That the carbon was consumed or broken—current ceased to pass through it.

74^7 X Q. Did all experiments with carbonized-paper conductors at Centre street result in the same way?

A. No; I think not.

74^8 X Q. What was the most satisfactory experiment you made at that place?

A. With paper carbonized in the furnace.

74^9 X Q. How long did the carbonized paper conductor last in this experiment?

A. Until we took down the lamp taking the carbon out practically uninjured. I can't say exactly how long. We were trying
everything we could think of at that time. We ran the
2929 lamps for a time, and took them down to examine the carbon, to see the effect, and to see if we had got the lamps
sealed; took them down often—daily, or every two or three days.

75 X Q. What was form of paper carbon in this instance?

A. That of a flat arch.

76 X Q. How was it secured to the holders?

A. Between a clamp constituting a part of the holder on the one side, and the holder on the other side of the paper. My impression is, held by a binding screw, but it may have been by binding around the two pieces of the holder by wire; am quite sure it was by binding screw, although not positive. The holders were made of gas-retort carbon—the upper ends of them.

77 X Q. What was size of this carbon arch?

A. Its whole length slightly more than $\frac{1}{2}$ in., rising in the center, in an arch form, above the tops of the holders three-sixteenths to $\frac{1}{8}$ of an in. In width somewhere from one-twelfth to one-twentieth of an in. In parts which were above the holders, the part held within the clamping of the holders was somewhere about $\frac{1}{8}$ in. square. The distance between the holders—clear space—about $\frac{3}{8}$ of in. Paper may have been a little longer than I have said.

78 X Q. Did this arch in position present its broadest surface vertically or horizontally?

A. Vertically; *i. e.*, the line across its broadest surface was vertical.

79 X Q. It was then cut in form before carbonization?

A. Can't say. It was cut in shape either before or after carbonization, but I can't say which. Best impression is it was cut before.

80 X Q. What tools did you employ for cutting out such arch forms after carbonization?

A. A variety; mostly with a knife between sheets of paper glued or fastened to it.

2930 81 X Q. In this particular instance of experiment how many lamps were in the circuit?

A. One, I think.

82 X Q. How much horse power did you employ in driving your electric engine?

A. Can't say, because power was furnished by the persons from whom we hired the room. Power was furnished by them for the whole building.

83 X Q. What kind of paper was that carbon conductor made from?

A. White blotting paper.

84 X Q. Single, or of several thicknesses?

A. I should think several thicknesses pressed together.

85 X Q. Was that conductor coated with powdered carbon?

A. No, sir; the paper was carbonized in box in furnace; was thicker after carbonization than we wanted; was worked down with emery paper after being worked in shape with knife and filing. This refers to paper shaped after carbonization. The burners shaped before carbonization were simply cut in shape with knife or scissors, and were ready for use after carbonization, except rubbing them down on the emery paper.

86 X Q. Do you remember positively the carbon conductor was in a state of incandescence for 15 minutes?

A. Yes, I should think for a couple of hours at a time.

87 X Q. What was the most satisfactory experiment which was made at the Howard-street shop?

A. I don't recollect putting up any paper lamps at the Howard-street shop. Was not there so much as at either of the other places. Seems to me we had paper carbons while there, but can't be certain about it.

88 X Q. How many carbon conductors of all kinds do you think were made at the Centre-street shop?

2931 A. Can't say. A great number, perhaps many hundreds.

89 X Q. You made these from every material you could think of or find?

A. Almost everything which seemed to offer a prospect of getting pure carbon.

90 X Q. What was the proportion of the different materials out of which you made carbon conductors?

A. Greater portion from French carbon.

91 X Q. How many lines of experiment were you pursuing at that Centre-street shop?

A. Can't say.

92 X Q. Several?

A. Yes, sir.

93 X Q. Who composed the working force in that shop?

A. William E. Sawyer, Mr. William Sawyer, Mr. Geo. Sawyer and myself, and Mr. William Sharp. Not certain that Mr. Sharp was at that shop but one day. He worked at the shop in Brooklyn mostly.

Another man we employed was in the shop a part of the time—working in his own shop also; name was Keating.

94 X Q. Know where Sharp lives?

A. Is now, I think, in Connecticut, in workshop of Wallace & Sons, at Ansonia.

95 X Q. Know where Keating is?

A. No; have made enquiries, but can't find him.

96 X Q. Is Mr. George Sawyer a brother to Wm. E. Sawyer?

A. Yes; he tended the door and ran errands.

97 X Q. What time did you give to experiments at Centre-street shop?

A. Was there every day. Sometimes five or six times a day; and from about 4 o'clock in the afternoon till dark. Meanwhile attended to my regular business.

98 X Q. How much time did Sawyers give to that shop?

A. I think all their time.

99 X Q. Know where Wm. E. Sawyer is?

2932 A. No; received letter from him yesterday stating he was going to Boston last evening. Letter received day before yesterday to the same effect.

Redirect examination:

100 R. D. Q. Please to look at this drawing which I hand you and state whether or not during your experiments and practice in making and using electric lamps you made and used an arrangement like that shown by this drawing, in which "A" represents a carbon section, "B B" metallic sections, and "C" a piece of platinum, and "D" a slit in the top of the metallic section of the conductor.

A. Yes, we did.

101 R. D. Q. State when you used that.

A. First at 43 Centre street, and first without the slit "D" the end and carbon resting down on piece of platinum "C." Afterwards used it with the slit.

102 R. D. Q. How much of time did you use this arrangement for holding carbon section?

A. I think during all the time we were there some of our lamps were so arranged.

103 R. D. Q. State whether slit "E" was cut into the end of the conductor and made to pinch upon the carbon section so as to hold it without the aid of screws?

A. Yes, sir; that was the object of it.

Counsel for Sawyer and Man offers the above drawing in evidence, and the same is marked Sawyer Exhibit No. 3, W. H. B.

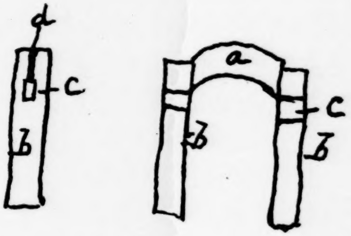
(Here follows diagram marked p. 2933.)

104 R. D. Q. State when it was you terminated your experiments at No. 43 Centre street.

A. Last of May or first of June, 1878.

105 R. D. Q. When did you resume, if at all?

Albon Man



No. 286.
C.E. Light Co
v.
McK Light Co
} p. 2933

March 16th 1881
Sawyer's Exhibit No. 3.
Wm. H. B.
Notary Public

2934 A. In latter part of August or 1st of Sept., 1878, at corner of Centre and Howard streets (Arnoux & Hochhausen's).

106 R. D. Q. Was that an experimental shop?

A. Yes.

107 R. D. Q. How long did you continue your experiments there?

A. Until the latter part—probably the last week of September, 1878.

108 R. D. Q. What electric lamps did you make there and what kind of carbon did you use for burners in them?

A. Made a considerable number—can't say how many—all sealed incandescent lamps; we never made any other.

109 R. D. Q. Did you use carbonized paper there in your lamps?

A. I think we did; but can't be positive.

110 R. D. Q. Previous to your going to corner of Howard and Centre streets, did you consider the invention of the carbonized paper burner completed?

Objected to by counsel for Edison, on the ground of being new matter, and otherwise incompetent.

A. Yes, sir.

111 R. D. Q. After you went to the corner of Centre and Howard streets, in the building with Arnoux & Hochhausen, did you do anything further to perfect the invention of the carbonized burner?

Objected to as not proper matter for re-examination, no cross-examination having been had.

A. I don't know that we did; we went on to manufacture it afterwards.

112 R. D. Q. Did you manufacture them afterwards and use them; if you did, state when and where?

Same objection taken.

2935 A. Whether we manufactured at the corner of Centre and Howard streets any of the paper carbons I can't be certain. We had some there, and it is possible that we made some while there; but after we went to the corner of Elm and Walker streets we manufactured them and put them in use immediately upon going there. We did one thing to them there that we had not done before, which was to cut the paper in perfect rings or washers before carbonization.

113 R. D. Q. State, if you recollect, how long you continued a paper carbonized burner in a state of incandescence at any one time?

A. All day, and until late in the evening. This, at the corner of Walker and Elm.

114 R. D. Q. And what was its condition when you turned off the current?

A. Same way as when we put it on, except possibly improved.

115 R. D. Q. When was that?

A. That particular one, I should say, was in the month of December, 1878.

116 R. D. Q. And was the carbonized paper burner made in the same way that those were made at No. 43 Centre street?

A. Yes, same as that in which some were made at No. 43 Centre street. There were other trials much before this, in October, but we only ran them during the day.

117 R. D. Q. Do you know William H. Church?

A. Yes, sir.

118 R. D. Q. Was it through Mr. Church that William E. Sawyer was introduced to you?

A. Yes; I think he was the moving party in the introduction.

119 R. D. Q. Was Mr. Church present much of the time during the experiments you have been testifying about?

A. Yes, sir, almost every day; and all day at a time.

120 R. D. Q. Was he there as a looker-on or a participator?

2936 A. Mr. Church was interested through Mr. Sawyer in our experiments, and he knew what we were doing.

121 R. D. Q. Did you explain to him, from time to time, what you were doing?

A. Talked to him continually about it.

122 R. D. Q. State who, besides Mr. Church, was present during the experiments you have described as being made at 43 Centre street?

A. A number of people came in there to look at the light, but only Mr. Church, Mr. Sawyer and myself and Mr. Sawyer's father, knew what we were doing; we kept our operations secret as far as we could.

ALBON MAN.

MARCH 15, 1881.

Met pursuant to adjournment.

Present, counsel as before.

WILLIAM H. CHURCH, witness produced on behalf of Sawyer and Man, having been duly sworn, testified as follows:

1 Q. What is your name, age, residence and occupation?

A. William H. Church; am 48 years of age; am selling electric lights for the United States Electric Light Company.

2 Q. State whether you are acquainted with Albon Man and William E. Sawyer, one of the parties in this interference?

A. I am acquainted with them both.

3 Q. State how long you have been acquainted with William E. Sawyer and Albon Man?

A. I have known William E. Sawyer since early in the year 1877, and Mr. Man since January, 1878; perhaps met him in December of 1877, or even a little prior to that.

2937 4 Q. State, if you please, where and how you made the acquaintance of these gentlemen?

A. Made the acquaintance of Mr. Sawyer first at the office of Mr. Schuyler in the Coal and Iron Exchange building in Cortlandt street; he was then engaged upon an electric motor for running light machinery; I saw a great deal of him during that year, almost every day.

5 Q. How did you make the acquaintance of Mr. Man?

A. Hearing that Mr. Man was greatly interested in the subject of electricity, I called at his house, and presented to him Mr. Sawyer's views upon the electric lighting, in which he took a lively interest, and I soon after that called again accompanied by Mr. Sawyer, and the subject was more fully discussed, and resulted in an arrangement between himself and Mr. Sawyer to enter into experiments for the purpose of developing the subject.

6 Q. When you called upon Mr. Man at his house, was that the beginning of your acquaintance with him?

A. Yes, sir.

7 Q. And that you think was in January, 1878?

A. Yes, sir.

8 Q. Did you have a letter of introduction to him?

A. I think I called with a neighbor of his, a Mr. Mayes.

9 Q. When you called on Mr. Man at his house, as you have stated, was it your object in calling there to present to him Mr. Sawyer's plan of electric lighting?

A. Yes, sir; that was my only object in calling.

10 Q. And you afterward introduced Mr. Sawyer and Mr. Man to each other?

A. I did.

11 Q. State as near as you can when it was that you introduced these gentlemen to each other?

2938 A. I should think the first or second Saturday in the month of January, 1878; it was on a Saturday evening.

12 Q. Was it at the house of Mr. Man?

A. Yes, sir; his present residence, 118 Putnam avenue, Brooklyn, N. Y.

13 Q. Have you any data in writing by which you can fix the date exactly?

A. I have nothing with me, but I think I have an old memorandum book which I carried with me, which I think will fix the date exactly.

14 Q. Will you please to produce that book and ascertain from it, if possible, the exact date when you introduced Mr. Sawyer to Mr. Man?

A. I will.

15 Q. Please to state whether or not that introduction between Mr. Man and Mr. Sawyer resulted in an agreement between them to develop Mr. Sawyer's plan of electric lighting?

A. It did in the following week; after the interview they arranged to commence.

16 Q. State, if you know, when and where they did commence?

A. They took a little shop in Centre street, No. 43 or 42 Centre street—I think probably 43—upon the west side of Centre street. I should think it was in the last part of January, 1878, some time.

17 Q. Please to give the history of what they done there in the

fabrication and operation of electric lamps. How, as far as you know, they did it. Please to begin at the beginning?

A. They put wires around the shop, which was a good-sized room, and connected in the wires glass globes resembling inverted bottles, in which was held pieces of carbon, and these pieces of carbon were changed as their experiments progressed, first of one form, and then of another, and the bottles were filled with gasses; they tried how many they could put and sustain from the circuit from a machine which they had procured. They finally had a small dynomo
2940 machine for experimental purposes placed in the shop.

18 Q. Please to describe the different forms of carbon you saw them use in their lamps, and in making your descriptions, please to make sketches of the different forms of carbon, as you recollect them?

A. Some were in straight pieces like No. 1 (see diagram); some in arch form like No. 2; some in circular form like No. 3; another like No. 4; Nos. 2, 3 and 4 were of paper; there was a No. 5 of paper; Nos. 3 and 4 were covered, I think, with plumbago, and were held in the holders, which were straight pieces of brass; figures 1, 2, 3, 4, 5, 6 and 7, of this drawing represent the forms of carbons, and a-outline of the manner in which they were put in the lamp, as I recollect them.

Counsel for Sawyer and Man offers the drawing in evidence for the purpose of illustrating and explaining the testimony of the witness, and the same is marked "Sawyer Exhibit No. 1."

(Here follow diagrams marked p. 2939 and 2941.)

19 Q. Referring now to the diagram which you have just made, please to state what Fig. 1 represents?

A. A straight pencil of carbon.

20 Q. What does Fig. 2 represent?

A. An arch shape of carbon.

21 Q. What Fig. 3?

A. Also an arch shape of carbon.

22 Q. And Fig. 4?

A. A straight piece of carbon with the ends bent down to wire around the ends of the holder.

23 Q. What Fig. 5?

A. An arch shape of carbon.

24 Q. And what Fig. 6?

A. The entire circle from which the arch Fig. 5 was taken out, the section "E" being taken out in form Fig. 5. I do not know whether it was taken out after or before being put in the lamp. I think, however, before being put in the lamp.

2942 25 Q. Figs. 2 and 5, as I understand it, represent the side of the carbon arch. That is the broadest surface of the arch?

A. Yes, they each represent the same view.

26 Q. Figs. 3 and 4, as I understand, represent the edge of the paper or carbon arch?

A. Yes.

Sawyer Exhibit No. 1.
March 15th 1881.
N. H. B.
Notary Public.

27 Q. Referring now to Fig. 7, what does "*a*" and "*b*" represent?

A. The metal conductors.

28 Q. And Fig. 1 represents the section of carbon in the circuit?

A. Yes, sir.

29 Q. Were all of these different forms of carbon made of paper?

A. Yes, sir.

30 Q. Please to state what the letter "*c*" represents in Fig. 7?

A. The chamber of the lamp, and "*d*" represents its base.

31 Q. Please to state when it was that you first saw these different forms of carbon made of paper?

A. It was the latter part of February or the first of March, 1878.

32 Q. Did you see all of these different forms at that time?

A. No, it was as late as May that I saw Figs. 5 and 6. The shop in Centre street was given up about the 1st of June, and I saw them all previous to this in that shop, except Fig. 5, which I think I saw in September after I had returned from the country.

33 Q. How was the carbon section, represented by the Fig. 1, held by the conductors "*a*" and "*b*" in Fig. 7?

A. By the spring of the two ends against the carbon.

34 Q. Were all of the different forms of carbon illustrated by the drawing held berween the metal ends of the circuit, the same as that represented by Fig. 1 in Fig. 7?

2943 A. In Figs. 3 and 4 the ends were wired upon the ends of the conductors.

35 Q. How was Fig. 2 held in the metal ends of circuit?

A. I think the metal ends of the conductors were divided or slit, as shown by Fig. 8 "*v, v*," the ends of the carbon being clipped into the slitted ends of the conductor, or a piece of platinum represented by "*z, z*." The letters "*a, b*," in this figure represent the metal ends of the circuit as in Fig. 7.

36 Q. State whether or no these carbons were in some cases held in the metal ends of the conductors by clamping screws and clamps?

A. I believe they were in the experimental holders, they were so, I know, in the lamp.

37 Q. State, if you know, whether or not the chamber of the lamp, represented by "*c*," was a sealed chamber, having the air exhausted out of it?

A. It was.

38 Q. I understand you to say that you saw Sawyer and Man use the chamber represented by Figs. 7 and 8. The carbons represented by Figs. 1, 2, 3 and 4, in the last of February and during the month of March?

A. I would say from the 1st of March till the middle of May I saw these carbons used in such chamber. Sometimes one and sometimes another, changes being frequently made, the chamber of the lamp being exhausted of air or filled with gas.

39 Q. State, if you know, how these paper carbons were made. I mean how was the paper carbonized?

A. They used a small metal box; the one I recollect seeing was of sheet iron, in which there was pulverized carbon and layers of the paper in the form described, alternately placed. And then the box was closed and fastened and put into the fire. I saw this one evening at Mr. Man's house. He came out of his private laboratory, showing me the box and explaining what he was doing. I subsequently saw him bring to the shop one morning a box, 2944 which he said he had left in the fire all night, and which he could not get open. It was subsequently opened by one of the workmen, but not in my presence. I, however, saw the carbons after they had been taken out of the box. I, indeed, saw these same carbons treated in oil, being put in oil and a current of electricity being run through them. This decomposed the oil and made a deposit of carbon upon the carbons already made, making them very tough, and making them of a grayish color.

40 Q. State, if you know, whether or not the paper previous to its being carbonized was treated with any kind of substance or material, and if so, state how it was prepared?

A. I saw a substance which I thought was sugar of lead, but never inquired what it was; also saw bottles of balsam which were used in the experiments, but I don't recollect how these materials were used; I did not see the paper prepared.

41 Q. Please to state when it was that you first saw the paper carbons used in the lamp—not experimentally, but in the lamp as perfected?

A. In September, 1878.

42 Q. Where was that?

A. Howard street, corner of Centre street, at first, and afterwards I saw it continuously from that time on through the winter in Walker street, corner of Elm.

43 Q. Referring now to the drawing, Sawyer Exhibit No. 1, please to state whether the several figures on that drawing represent all the different forms of carbons made of paper which you saw used by Sawyer and Man between the 1st of March and the 1st of June, 1878, and if not, please to make a drawing of such other forms as they used?

A. I saw a V-shape carbon of paper, as shown by Fig. 9 of the sketches made by me in the Sawyer Exhibit No. 1, in addition to those I have already described.

2945 Cross-examination by GEORGE W. DYER, Esq., counsel for Mr. Edison:

1 X Q. I call your attention to the lamps referred to in your 41st and 42d answers, being the lamps you say you saw perfected and in use in September, 1878, from that time on during the winter. How many different lamps did you see at that time at the places named?

A. Quite a number; it would be difficult to give the number of separate, distinct lamps; sometimes the same lamp was taken down and put up again and again; but for a guess, I should say 25 or 30, probably. But this is a guess.

2 X Q. How many different lamps can you state from recollection that you saw at that time at the places named?

A. They put up one lot of lamps in which there were six or

McK. Light Co. } p. 2946

Sawyers Exhibit No. 2.
March 15. 1881.
T. K. B. Notary Public

eight of a kind. Then another lot varying from that of about as many more or perhaps a dozen. Then still another form of as many more—say a dozen. Each of these lamps—some at least—were taken down and refilled again, or perhaps two or three times, to observe their working. There was still another kind I think of; being four different lots. But the last did not have a paper carbon, but a straight pencil. Mr. Sawyer called it the feeder lamp.

3 X Q. Please state when and where the first lot you mentioned were put up?

A. In Centre street, No. 42 or 43, as designated this morning. The first lot was in September, in Howard street. One lamp put up in May was rather crude.

4 X Q. When was the shop in Centre street given up?

A. In May, 1878.

5 X Q. When was the shop in Howard street taken?

A. From memory, I should say July, 1878.

6 X Q. When was the room taken corner of Walker and Elm streets?

2947 A. In October.

7 X Q. How long was that kept?

A. Spring of 1879. Should think the month of April.

8 X Q. The first lot put up in September, in Howard street, were they all alike?

A. Yes, as I remember.

9 X Q. Of what was the shell composed; what was the size and form?

A. Shell was wholly of glass. It was about eight inches or more high, with a cylindrical body and globular top. The body being about 2½ inches in diameter.

10 X Q. What was contained within this shell?

A. This lamp contained a radiating conductor in the form of a coil from the bottom up to about where the bulb commenced, terminating in a flat piece, extending partially across the shell; above this the carbon was sustained. The means for holding the carbon for its regulation, were quite similar to those shown in Fig. 1, patent No. 205,144, but with these differences: A little spring at the back to regulate the pressure on the carbon by pressure against one end of a pivoted top piece, the other end of which pressed the carbon down upon its seat.

11 X Q. How was the bottom of this shell closed, and with what material?

A. Was closed with—1st, a flat cap made of glass which was ground to fit the bottom of the chamber, and was held to its place by screws passing through metal rings against the flange of the chamber.

12 X Q. Please make a sketch of this lamp you have been describing, so that the same may be attached as an exhibit in this case?

A. I have made such a sketch, and the same is appended and marked Fig. 1, Sawyer's Exhibit No. 2.

(Here follows diagram marked p. 2946.)

13 X Q. Designate by letters the different parts you have testified about?

A. "A" is the body; "B" the bulb; "C" the cap, or glass
2948 plate; "D" the metal rings; "E" the screws holding the
metal rings together; "F" socket to screw upon a bracket or holder; "G" the carbon; "H" pivoted top piece; "I" the receptacle for the other end of the carbon; "J" spring attached to pivoted top piece; "H" to regulate the pressure on the carbon; "K" a coil of conductor for bringing in the current and radiating the heat from the base of the lamp, or to prevent the radiation of heat to the base of the lamp; "L" is standard to sustain the top piece "H."

14 X Q. What was the necessity of a spring to regulate pressure upon the carbon?

A. As I understood, the carbon when heated would expand, and if a rigid pressure was placed upon it, it might bend. The object was to relieve the carbon from any liability to bend or break.

15 X Q. What was the size of the carbon in this lamp?

A. Should think about $\frac{5}{8}$ inches long, and about size of pencil lead in ordinary pencil; size was not always the same.

16 X Q. What was size of radiating conductors "K"?

A. One-eighth of an inch in diameter.

17 X Q. Was the carbon fastened at each of its ends?

A. I don't think it was fastened at either end; a recess received each end, top and bottom.

18 X Q. What was that carbon made of, speaking of your own knowledge?

A. I could say.

19 X Q. How many of these lamps were in the same circuit?

A. Three.

20 X Q. How was the electrical power applied to this circuit of lamps?

A. My recollection of the things which occurred at Howard
2949 street is not so clear as of things which occurred later. I
don't know how much power was used at Howard street, or what kind of power it was.

21 X Q. Was this electrical power applied to all three of the lamps at the same time?

A. It was, but I don't know how much power was applied.

22 X Q. What was contained in the chamber of this lamp of which you have made a sketch, in the nature of gases?

A. I don't know about the gases. I thought it was pure nitrogen gas, but am not sure about it. I think there was a little bag of sodium put in the chamber.

23 X Q. How long did you see this circuit of lamps burning at any time at Howard street?

A. Never watched it more than an hour at a time.

24 X Q. How many times did you ever see them burning at Howard street, to your recollection?

A. Can't say; but am certain it was several times.

25 X Q. Do you know whether the carbons were changed or re-

placed during the period when they were in operation in Howard street?

A. Don't know they were changed and do not believe they were; could not be without taking the lamps apart.

26 X Q. Will now call your attention to the second lot of lamps referred to in your answer to cross-question two. Where was this second lamp put up, and when?

A. In Walker street corner of Elm; was in November, 1878.

27 X Q. How many of those lamps were there which were alike?

A. Should think all were alike, and I think about a dozen of them.

28 X Q. How were these lamps constructed?

A. Something like the patent drawing 205,144. Figure 2, Sawyer's Exhibit No. 2, represents these lamps, and is made a part of my testimony.

Examination adjourned until 10 o'clock a. m., March 16, 1881.

2950 MARCH 16, 1881.

Same parties present.

Cross-examination continued:

29 X Q. Please describe the construction shown in said sketch, and letter the various parts.

A. The letter "B" represents the chamber of the lamp. "C" represents the brass cap covering the bottom of the lamp. "D" represents the plates with screws to hold the cap against the flange of the chamber. "E" a metal cup to cover the bottom of the lamp. "F" the screws that hold the plates against the flange of the lamp before the metal cup is put on. "G" the carbon pencil. "H" the cross-bar against which the upper end of the pencil makes a contact. "I" the seat in which the pencil makes its lower contact. "J" the rod with spring which regulates the pressure of the top piece "H" upon the end of the carbon. "K K" the radiating conductors. In this instance the screws "F" are permanently fixed for the purpose of holding the plates.

30 X Q. What was the material of which the chamber was composed?

A. Glass.

31 X Q. Of what size?

A. Eight or nine inches high, about two inches in diameter.

32 X Q. What was size of radiating conductors "K K"?

A. Don't know the number of wire of which they were made, but should say a little less than one-eighth inch in diameter—coiled in a spiral—forming a helix.

33 X Q. With what gases was the chamber filled?

A. Don't know, but I thought at the time nitrogen. A bag of sodium was put in, I think, to improve the atmosphere of the lamp.

34 X Q. What was the size of the carbon pencil?

A. About same size as in figure 1.

35 X Q. Of what material was it constructed?

A. Don't know. Lamps were often changed as to their carbon.

2951 36 X Q. How much electric current was thrown upon the circuit?

A. Don't know; but remember Mr. Sawyer had a large coil of wire he used to put in to increase the resistance—this when there was only one lamp operated.

37 X Q. Please describe the next lot of lamps referred to in your answer to cross-question 2.

A. I am not certain that this third lot was not operated before my second lot; I am not confident of it. I have made a drawing, figure 3 of Sawyer Exhibit No. 2, which represents the third lot of lamps. "B" represents the glass chamber. "C" the glass cup against the glass flange of the chamber. "D" the metal plates to hold the cap against the flange. "F" the screws passing through these metal plates. "E" the metal cup covering the bottom of the lamp. "G" the carbon. "H" the top piece against which the carbon makes its contact. "I" the lower piece. "K" the radiators, which were straight in this lamp, as I remember, being composed of little flat pieces—perhaps of three-eighths inch in width. "L" the standard to which the cross-piece "H" was pivoted. "J" the small wire with spring attached, to regulate the pressure through the cross-piece "H" on the upper end of the carbon. The straight radiators were made of thin brass strips so as to form all together about three-eight-s of an inch across. This is better described in No. 210,809 of patents, dated December 10th, 1878.

38 X Q. Fix the time as nearly as possible when this kind of lamp was produced; the other lot was in November, 1878.

A. This was about the same time; perhaps a little earlier or later. Another lot was about the same time, which was the fourth lot.

39 X Q. Referring to figure 3, what were the dimensions of this lamp?

A. About the very same size; perhaps the very same size.

40 X Q. What gases was it filled with?

2952 A. Didn't know much about the filling. I supposed it was filled with same gases as preceding, and I think it had the bag of sodium in it.

41 X Q. What was the size of carbon G in this instance?

A. About same as in preceding lamp.

42 X Q. Know what it was made of?

A. No, sir.

42½ X Q. Know how much current was employed in circuit of these lamps?

A. Had it on a 4-horse engine used to run an Arnaux & Hochhausen dynamo machine.

43 X Q. How many lamps did you see in circuit run by this 4-horse-power engine?

A. I should think 6; might have been 7 or 8. Don't think more than 7 or 8. Have watched 6 lights very often.

44 X Q. How long did you see these 6 lights burning continuously at one time?

A. Two hours and a half. Usually watched them about an hour. Seen the current turned in gradually from the light of a very small taper up to a full incandescent light; the best incandescent light, by all odds, I have ever seen.

45 X Q. Make a sketch of fourth and last lot of lamps referred to in cross-question 2.

A. I have made the sketch, figure 4 of Sawyer Exhibit No. 2, and lettered it. "A" represents the glass chamber, which was about 8 inches high, and $1\frac{1}{4}$ inches in diameter, with a flange at the bottom against which the glass plate "B" is pressed. "C" are the metal rings to hold this plate "B" against the flange, and "D" are screws passing through the metal rings. "E" is a metal cap covering the whole. "F" is a carbon arch. "G G" are pieces to which it is attached. "H" are the radiating conductors which are formed in uniform Greek form.

46 X Q. Do you know when this type of lamp was produced?

2953 A. My wife was taken ill last of November and died 11th day of December; it was after the 16th of December I came to New York. Then I think I saw this lamp for the first time.

47 X Q. What gases was chamber filled with?

A. Don't know. Don't remember whether it had a bag of sodium in it or not.

48 X Q. How many of these lamps did you see in a circuit together?

A. About the same number, *i. e.*, about half a dozen more or less.

49 X Q. What amount of current on the circuit?

A. Same engine as was referred to in a previous answer was used.

50 X Q. What was size of radiating conductor in this instance?

A. About $\frac{1}{16}$ inch thick and about $\frac{3}{8}$ inch in width, made of sheet brass. One of these lamps is described in the application for patent involved in this interference, filed Jan. 9, 1880, figure 2.

51 X Q. What was the size of the carbon "F" in this instance?

A. Of arch shape; looked like a black wire of about the size of an ordinary pencil lead, possibly a trifle larger.

52 X Q. What was distance across from one of its feet to the other?

A. Little less than half an inch, I should think, inside measurement.

53 X Q. What do you remember was the height of the arch?

A. About a true semicircle, and a trifle over one-fourth of an inch high, as nearly as I can estimate from memory.

54 X Q. Do you know of what this carbon was composed, in this instance?

A. No, sir; but I suppose were made of carbons I saw worked up before I went away.

55 X Q. How long did you see these lamps burning con-
2954 tinuously in a circuit on any occasion?

A. Should think about an hour; others were present.

56 X Q. Referring now as to what you have testified about the making of paper carbons in the shop on Centre street during March, April and May, 1878, did you yourself see any of the forms illustrated in Exhibit No. 1 cut out of paper?

A. Did not see them cut, but seen them after they had been cut.

57 X Q. What kind of paper did they appear to have been cut from?

A. I should say out of white blotting paper. I did not handle them, but merely saw them; according to my opinion they were blotting paper. All may not have been of blotting paper, for what I know.

58 X Q. Did you yourself see any of these forms put into a box for carbonization, and afterwards taken out of the same box in a carbonized condition?

A. I saw the pulverized carbon which I understood was to go into the box; and I saw the paper which was to go in the box; and I saw a paper after it had been taken from the box; but didn't see a paper put into the box and the box heated, and carbon taken from the box.

59 X Q. Do you know, of your own knowledge, that you saw at any time at the shop at Centre street, any carbonized-paper conductor for an electric lamp?

A. Yes, I saw pieces of carbon formed of paper of Figs. 1, 2, 3 and 4 Sawyer Exhibit No. 1, tried in Centre street, during the experiments made there.

60 X Q. How do you know these were formed of paper?

A. I saw some of them formed entirely with the plumbago put upon it and stretched across and fastened to the conductors and carbonized in the lamp. In giving a former answer (to cross-question 58) I referred particularly to Figs. 5 and 6, which were never 2955 carbonized in a lamp on account of their shape. Figs. 2, 3 and 4, particularly 3 and 4, did not rest upon my mind, as I regarded them as experiments which were not successful.

61 X Q. Please state when the first instance was of your own knowledge that a paper-carbon conductor of the character of 5 and 6, Exhibit No. 1, was used in an electric lamp.

A. To my knowledge, in December, 1878, and not far from the middle of December.

Examination-in-chief resumed:

62 Q. Referring now to the paper carbons which you say you saw in the shop in Centre street, as illustrated by Sawyer Exhibit No. 1, please to state whether at the time you saw these paper carbons, or papers to be carbonized, and the box in which the paper was carbonized, you were told by Mr. Sawyer or Mr. Man that the carbons you saw were made of paper and were carbonized in the box that you saw.

Objected to by counsel for Edison on the ground of hearsay testimony.

A. Yes, sir.

63 Q. Which of them told you those carbons were made of paper?

Same objection.

A. I think Mr. Man; I am not sure but that they both told me. Remember particularly Mr. Man telling me so.

64 Q. What was the appearance of the box, did it look as though it had been in the fire?

A. Yes. He brought over one one morning which he could not open. He said it had been in the fire all night.

2956 65 Q. Did you see that box opened?

A. No; I saw it after it had been opened.

66 Q. Did you see the paper forms and the powdered charcoal and box together or near each other?

A. Yes, saw them all together on the bench.

67 Q. Was any one working with them?

A. Yes, sir.

68 Q. Who?

A. Think Mr. William Sawyer.

69 Q. Did he tell you what they were, and what he was going to do with them?

A. No, sir.

70 Q. Referring now to the four different sets of lamps which you have described in your cross-examination, and especially to the carbon burners which you say you saw used in those lamps, please to state whether at the time you saw those lamps any one told you that the carbon burners in them were made of carbonized paper, and if so, please state who told you so?

Same objection taken.

A. Could not tell who told me; I have no vivid recollection of being told by any particular one of the carbon that happened then to be in use being made of paper. The material from which the carbons were made were of great variety, as I was told at the time.

71 X Q. At the time you saw these lamps in use was it your understanding then that some of the carbons in the lamps were made of carbonized paper?

Objected to on the ground that the understanding of the witness is not competent testimony, unless it appears that it was derived from his personal knowledge.

A. Yes.

72 Q. How did you get that understanding at that time?

2957 A. From seeing the carbonized paper in the shapes designed for the lamps; from seeing them worked over, and seeing them treated?

73 Q. Do you mean to be understood as saying that you got that understanding from the fact that you saw the forms of the carbons cut in paper, and that you saw the powdered charcoal and the carbonizing box and carbons of the same form, and from the fact that you were told at the time that they were paper?

Objected to on ground of hearsay evidence.

A. Yes, sir.

WILLIAM H. CHURCH.

2958 & 2959 MARCH 17, 1881.

Parties met pursuant to adjournment.
Present, counsel as before.

WILLIAM SAWYER, witness produced on behalf of Sawyer and Man, was called and sworn:

1 Q. State your name, age, residence and occupation.

A. My name is William Sawyer; age, 59 years; reside at Earle's hotel in the city of New York; am a machinist.

2 Q. State, if you please, where you were employed in the spring of 1878.

A. At 43 Centre St., in the city of New York.

3 Q. By whom were you employed?

A. By Mr. A. Man and my son, Wm. E. Sawyer.

4 Q. About what time in the spring or latter part of the winter did you go in their employ?

A. In February or March of the same year.

5 Q. Please state what you were employed to do for your son and Mr. Man.

A. Employed in constructing what we call an incandescent electric lamp; about our first was in producing a carbon suitable for our purpose, *i, e.*, to be used in a lamp; amongst others were other materials; we experimented upon different papers in various manners.

6 Q. Please state what you yourself had to do with making carbons for the electric lamps—of carbonized paper.

A. Merely to assist them in their work.

7 Q. Did you, as an assistant to them, cut the paper into the form that you wanted the carbon to be, and then put it in a box and carbonize it?

Question objected to as being leading.

A. I assisted in that; yes.

2960 8 Q. Describe how you made carbons—or carbonized paper for electric lamps.

A. Our first attempt was by paper—say blotting paper—by putting graphite or plumbago, and then rubbing and working in this graphite till it is permeated with it. We then applied the two poles of an electric machine to it to see if we could get the current through. It went through imperfectly, but not satisfactorily. We then put that paper into the lamp, filled with common illuminating gas. Then we sealed the lamp and applied the electricity. The result was we got an imperfect current. We took the lamp apart, examined it and virtually went through the same operation again. That was the first attempt at carbonizing paper.

9 Q. What shape were the pieces of paper which you tried to

carbonize in that way; please to look at Sawyer Exhibit No. 1 and state if you recognize any of the forms shown on that drawing as being the same as those used by Sawyer and Man to make carbons for their lamps?

A. I recognize Nos. from 1 to 7 inclusive.

10 Q. As I understand you, they used straight strips of paper?

A. Our first attempt was with them.

11 Q. And some arched pieces of different forms?

A. Yes, sir.

12 Q. After they got through with their efforts to carbonize the paper with the current of electricity, what other way did they adopt to carbonize the paper?

A. By putting it into powdered carbon and subjecting it to heat; sometimes saturated paper with a solution of acid, or with solution of powdered carbon and water.

13 Q. In preparing the paper for carbonization, did they first wet it?

A. As a general thing, in a solution of some sort of carbonaceous matter.

2961 14 Q. What did they put the pulverized carbon in?

A. In an iron box?

15 Q. Always in an iron box?

A. Not always; my impression is, in a tin box first, but that was melted out; afterwards in an iron box, which I got out, or made.

16 Q. How did they arrange the paper to be carbonized in the box with the pulverized carbon?

A. With alternate layers of carbon and paper; first carbon, then paper; carbon again, then paper, till box was filled; and pressed down with a follower in the box, so as to get it as compact as possible; last layer was carbon.

17 Q. After you got the box filled, did they put a cover on it, and how was it fastened?

A. A cover was put on and fastened down with wire.

18 Q. Did you see the paper and carbon put in the box?

A. Yes; my impression is I put them in myself; I know I put some of them in.

19 Q. Did you see the box put in the fire and heated?

A. Not the first, but I did afterwards; the first box that was filled Mr. Man took home and brought it back in the morning; he could not open the box on account of the iron having been fused, and I put a pressure on it and opened it.

20 Q. Did you put the lid on the box and wire it down?

A. Yes; we together did; he assisted.

21 Q. Did you open that same box the next morning?

A. I did.

22 Q. Were the wires still on it the same as you had put them on the night previous?

A. Still on; but in different places fused together, so as considerable effort was required to cut them without destroying the material inside.

2962 23 Q. After you got the box open, did you take out the carbonized paper?

A. We took them; I at least saw them taken out.

24 Q. What condition were they in?

A. Various; some perfect, others broken or destroyed.

25 Q. Did you put any of these carbons that were in that box in a sealed lamp and try them?

A. Yes, sir.

26 Q. How did it do?

A. With varied success.

27 Q. What do you mean?

A. Some would run longer than others; some would fail; some would do very well; some would fail from imperfections of the lamp; from sealing, or, as we judged, from imperfect contacts, or mechanism.

28 Q. State, as near as you recollect, how long the best of them was used in the lamp in a state of incandescence.

A. I should judge anywhere from one to three or four days, or perhaps a week, at different times; have not distinct recollections of the exact time any one burned; I can positively state it was more than one day or two.

29 Q. How long have you seen any one of the best of them burn continuously?

A. We would put on the current and run it as long as the machine ran, and then take it off. That would be, say from 4 to 5 hours at a time, as nearly as I can recollect, and then when the engine commenced again we would put it on, the power being furnished by the building in which we rented the room.

30 Q. After you had run it that way and took it off, how did they appear?

A. Some would seem to be in perfect order and some imperfect—principally owing to defective mechanism in the lamp.

31 Q. How often was the iron box charged with carbon and paper and carbonized, as you have described in Centre street?

2963 A. Can't state the number of times, but was used quite a number of times.

32 Q. Did you see it (the box) put in the fire and the paper carbonized after the instance you mentioned of Mr. Man taking the box home?

A. Yes; put it in myself and took it out.

33 Q. Saw the papers put in and saw the carbons taken out?

A. Yes.

34 Q. Was the result about the same?

A. Yes, sir.

35 Q. All this, I understand, took place in Centre street?

A. Yes.

36 Q. When was it that you quit work in Centre street?

A. Can't say.

37 Q. Where did you go from Centre street?

A. To Nos. 2 and 4 Howard street.

38 Q. When did you go to Nos. 2 and 4 Howard street?

A. I think in the summer of 1878.

39 Q. Do you recollect what time in the summer?

A. Should judge, as near as I can recollect, in June.

40 Q. Did you use any carbons made of carbonized paper there?

A. We might have done it, but my impression is we did not. I think after we left Centre street we began on a different kind of carbon, but afterwards returned to paper.

41 Q. After you got through at corner of Howard and Centre streets, where did you go?

A. Corner Walker and Elm.

42 Q. When did you go to the corner of Walker and Elm streets?

A. October, 1878, I think.

43 Q. Can you recollect what time in October?

A. Couldn't state positively; probably some time between the 1st and 15th of the month.

2964 44 Q. Do you recollect whether or not you returned to the use of carbonized-paper carbons corner of Elm and Walker streets?

A. I do; yes.

45 Q. Were the carbons of carbonized paper that you used corner Walker and Elm made in the same way that they were at 43 Centre street?

A. Virtually so, but we added at different times several other treatments; by solidifying the paper; pounding it; and subjecting it to hydraulic pressure.

46 Q. Was the results of the carbonization about the same as in Centre street?

A. Was better.

47 Q. Do you recollect of cutting the carbon burner to the desired form out of the carbonized paper after its carbonization?

A. Yes.

48 Q. How did you do that?

A. Done by a knife and file; that is, was worked down to the form we wanted them by these tools; were delicate things to handle; used to stick them to a piece of glass with balsam or cement and cut them down. By merely warming the glass we could take them off and by subjecting the glass to a blaze—heat, we could take all the superfluous or foreign coating from the carbon.

49 Q. How much of the time did you use carbons made of carbonized paper while at the corner of Walker and Elm streets?

A. I think we were at work upon them several weeks.

50 Q. Did you see them put in the lamps and illuminated?

A. Yes; I put them in.

51 Q. State how long you saw any one of the carbons made of carbonized paper illuminated continuously at the corner of Walker and Elm streets, as near as you can recollect.

2965 A. My answer is about as before. We ran them from day to day.

52 Q. Did you take occasion to examine them after they had been thus illuminated?

A. Yes, some seemed as perfect as when they went in, others were fractured.

53 Q. How many lamps did you have in circuit in Elm and Walker?

A. The highest number I think was eight.

54 Q. Was that as many lamps as your electro-dynamo machine would supply with the necessary current to illuminate the lamps?

A. Don't think it was, but the size of our engine limited us. We didn't have power enough to run the dynamo machine up to its capacity.

55 Q. What was the size of the engine?

A. Nominally 6-horse-power engine and 6-horse-power boiler. I don't think it was a 6-horse-power boiler, however.

56 Q. You say you had as many as eight lamps in circuit at one time?

A. Yes, to the best of my recollection.

57 Q. State, if you know, how many of those lamps were filled with carbonized-paper burners.

A. Can't say positively, but think all were furnished with such burners.

58 Q. Did you put the carbonized-paper burners in the lamps yourself?

A. Yes.

59 Q. In Centre as well as Walker street?

A. Yes, I made them all.

60 Q. Please to look at the drawing making part of the patent granted to Wm. E. Sawyer and Albon Man, June 19th, 1878, No. 205,144, and state, if you please, whether you recognize that as an illustration of either of the lamps to which you have been referring in your examination.

A. I do.

2967 61 Q. In which of the shops to which you have referred in your examination were lamps like that made?

A. I think in Howard street; and I know corner of Elm and Walker streets.

62 Q. Look at drawing making part of the patent granted to Wm. E. Sawyer and Albon Man, December 10th, 1878, No. 210,809, and state whether the drawing making part of the patent last mentioned represents either of the lamps to which you have been referring in your examination.

A. Yes, I recognize it.

63 Q. In which shop was that made?

A. I think corner of Walker and Elm. I know we made them there.

64 Q. Please look at drawing which I hand you making part of the application for the patent involved in this interference, and state whether that drawing rep*rep*resents any one of the lamps to which you have referred in your examination.

A. I recognize it fully.

65 Q. Can you state where lamps of that style were made?

A. Corner Walker and Elm streets.

W. C. Baldwin

Sawyer Exhibit No. 4
March 17-1881

66 Q. What kind of a lamp was it in which you used the paper-carbon burners at No. 43 Centre street?

A. Like Fig. 7, Exhibit Sawyer No. 1.

The drawing marked Sawyer Exhibit No. 4, and referred to by witness in answer to question 64 is admitted by counsel for Edison to be a copy of the drawing making part of the application of Sawyer and Man, involved in this interference.

(Here follows diagram marked p. 2966.)

This drawing is offered in evidence and marked Sawyer Exhibit No. 4.

Counsel for Sawyer and Man gives notice to counsel for Mr. Edison that upon the hearing of this interference he will use 2968 in evidence the filed papers making part of the application for patent on behalf of Sawyer and Man, and also on behalf of Mr. Edison, and also the patents which are of record in the Patent Office, No. 210,809, dated December 10th, 1878, and No. 205,144, dated June 18th, 1878, both of which were granted to Sawyer and Man, numbered and dated as aforesaid.

67 Q. Referring now to the lamps shown in the patent No. 205,144 to which I have referred, state whether you saw any carbons made of paper used in that lamp.

A. I don't recollect that I did.

68 Q. State if you recollect of seeing carbons made of paper used in the lamps illustrated in the patent 210,809 to which we have referred.

A. Don't recollect that I did.

69 Q. State if you recollect of seeing carbons made of paper used in the lamps shown by the drawing Sawyer Exhibit No. 4.

A. I do recollect it.

70 Q. State whether or not that substantially represents the lamps in which you used the paper carbons at the corner of Walker and Elm streets, New York.

A. I do.

71 Q. How soon after you moved to corner Elm and Walker streets was it that you commenced to use this lamp with the paper-carbon burners?

A. Immediately.

Cross-examined by GEORGE W. DYER, Esq., counsel for Mr. Edison:

72 X Q. About the box which you got up for carbonizing paper at Centre street, when did you get it up and how was it constructed? Answer fully.

A. We commenced work on this paper immediately after 2969 we went into the shop; a box was constructed out of either American or Russian sheet iron, to the best of my recollection; box was oblong and rectangular; judge it was three or four inches—probably four—long, and about two and a half or two and three-quarters inches wide, and about two inches deep; it was cut out of a single piece of sheet metal making the bottom and sides and ends—sides and ends being turned up at right angles; it was secured at the corners by lapping over and pounding together, or brought up in close contact; a counterpart of the same, made of sheet metal, but not so deep as the first, slipped down over it, constituted the cover.

73 X Q. How long was that box used?

A. I don't think more than once; think Mr. Man fused it together the first time it was used.

74 X Q. Describe the next box you got up.

A. Was about the same as this one; indeed, we made several like it. I think I improvised one of these boxes out of a piece of cast iron.

75 X Q. When was the cast-iron box made? And describe it.

A. Couldn't say when it was made, but about that time. Its shape was circular—a section of a hollow tube—about two and a half inches in diameter, inside dimensions; was made of cast-iron tubing, such as might be found in any junk-shop; the top and bottom were made of flat pieces of cast-iron metal to cover the ends, the ends fitted so tightly that powdered carbon would not sift out; the ends were secured by winding wire lengthwise over the whole.

76 X Q. Is this the box that was principally used after this?

A. No; this one was only used once.

77 X Q. How many ones did you make after that before you got the one used principally?

A. Did not use any "principally;" we would generally destroy the boxes in using them once or twice; we made new ones whenever they were needed.

78 X Q. Were those you made subsequently any different from the ones made out of pipe?

2970 A. We never made but that one out of pipe; we made no others of cast iron.

78 X Q. You said, in answer to a question in the examination-in-chief, that you yourself saw one or more of these boxes of carbonization packed and unpacked after they came from the furnace; when you opened such box what did you see in the interior?

A. Powdered carbon and the pieces that we put in.

80 X Q. Were the boxes just as full when unpacked as when packed?

A. Don't think they were.

81 X Q. How much waste was there of the powdered carbon in the box?

A. Couldn't say; didn't measure it or weigh it?

82 X Q. Apparently how much?

A. The best I can say is some waste; part of it looked like ashes.

83 X Q. In what part of the box did you find the ashes?

A. On the top or at the edges.

84 X Q. How large were the papers for carbons you put in such boxes?

A. Generally cut out for our immediate purpose; sometimes we would change the shape, as I described in my examination-in-chief; I should judge the straight ones were from ¼ in. to ⅜ in. in length; these were about ⅛ in. in width, I think, and about thickness of ordinary blotting paper; those of the arch form were about the same in width and length (that is, across the base); the straight ones extended about ¼ in. over the loop.

85 X Q. Were these all cut out of ordinary blotting paper?

A. No.

85½ X Q. What was the thickness of them?

A. Ordinary blotting paper was used when we used such paper, except that the blotting paper could be compressed, whereas the other could not; with the means we had at hand I did not
2971 measure them, and do not state this as an expert.

86 X Q. How much would these papers shrink in becoming carbonized?

A. Don't know.

87 X Q. You say that some of the paper carbons were used at the Centre-street shop in a lamp like Fig. 7 of Exhibit No. 1; is that so?

A. Yes; used them in two ways.

88 X Q. Was this lamp a bottle, and if so, what kind of a bottle?

A. No.

89 X Q. What was it?

A. If I am right about it they are called Florence flasks in the market.

90 X Q. How was the mouth of it stopped?

A. As a general thing by a glass stopper; then, again, by a metallic stopper; tried them both ways; also used cork stoppers.

91 X Q. How did you fill these flasks with illuminating gas?

A. By a centre hole in the stopper; then we put our tube in there and put on the force of the gas and drove the air out, this tube not being close-fitting in the hole; and also by exhausting the air from the flask and applying a close-fitting tube.

92 X Q. How did you stop this tube-hole after you had finished putting in the illuminating gas?

A. By a plug.

93 X Q. By pulling tube out, then putting a plug in?

A. Yes; there was no other way.

94 X Q. When you exhausted the air from the flask, how did you do that?

A. By applying an air pump in some instances; in others we used quicksilver.

95 X Q. Explain how you applied the air pump and how you removed it?

A. Mr. Man did that; he took the flasks out and exhausted the air out of them by an air pump; will not state that this was
2972 on this particular form of flask; can't state what particular form of globe it was on; we had more than a dozen or twenty forms.

96 X Q. Do you know of your own knowledge that the air was

ever exhausted from one of these flasks, bottles or lamps used at the Centre-street shop?

A. I know we attempted it with quicksilver, whether we exhausted it or not is another matter.

97 X Q. How did you attempt it with quicksilver?

A. By filling the tube with quicksilver and by letting it run out through a plug; also used water in connection with it, I think, how I can't tell; Mr. Man and Ed. (Wm. E. Sawyer) always did this, and I stood by and assisted in various ways; just how it was done I cannot now explain.

98 X Q. You mean to be understood that you have forgotten about this part of the experiment?

A. I do not; some of the minor details do not strike me forcibly.

99 X Q. Did Mr. Man and Wm. E. Sawyer in using quicksilver for exhausting the air put the quicksilver first into a flask, bottle or lamp, then put in the mouth-piece with a tube in it and then pour out the quicksilver through the tube?

A. Can't state that positively, but my impression is it was filled through a tube, let out through a tube. My impression is the quicksilver as it went in forced out the air.

100 X Q. How long was this tube?

A. I couldn't state.

101 X Q. Can't you tell whether it was an inch or a foot or six feet long?

A. Cannot answer.

102 X Q. When the quicksilver went into the flask, bottle or lamp, how was the carbon conductor protected from destruction?

A. I don't think in this particular flask, Fig., Exhibit 1, we ever exhausted the air except by introducing gas. I don't think they ever used the quicksilver to exhaust the air where a paper carbon was employed; in all such instances they filled the lamp 2973 with illuminating gas. The lamp they used quicksilver in, is, I believe, Fig. 7, Exhibit 1. We used other carbons besides paper in this lamp and held them (the other carbons) by the spring of the post——

The former question X Q. 102 objected to by counsel for Sawyer and Man, on the ground that it is not cross-examination, and on the ground that the witness has already stated that he did not understand the detail of the exhausting of the air out of the lamps, or making the vacuum in the lamps.

Witness resuming, says he has no further answer to make to the question.

103 X Q. In these experiments at Centre street, what kind of apparatus produced the electricity employed?

A. We had at that time an Arnoux & Hochhausen machine, which was the one used. Afterwards we had other machines at Centre street. I believe we had a Weston. Had no others to my recollection, except a machine to charge up with, which was of the same kind as the other one, *i. e.*, an Arnoux & Hochhausen machine.

104 X Q. What machine was used in the experiments where light was produced in electric lamps with paper-carbon conductors?

A. Arnoux & Hochhausen.

105 X Q. Give the dimensions, as near as you can, of some parts of that machine.

Objected to as not cross-examination, and not bearing on any matter in issue.

A. My impression is that it is one of Arnoux & Hochhausen's No. 2 machines—the armature runs in water.

106 X Q. Do you know about its resistances?

Same objection.

A. I do not; am not an expert in that matter.

2974 Redirect examination:

107 Q. In answer to cross-question 100 you say you couldn't state how long the tube was used in putting quicksilver into the lamp chamber, and further on you say, in answer to question 101, you could not tell whether it was a foot or six feet long?

A. That was what Mr. Dyer said. Presumably it did not exceed a foot.

108 Q. Have you any distinct recollection as to how long it was?

A. I have not.

109 Q. X Q. 101 was as follows: "Can't you tell whether it was an inch or a foot or six feet long," and you answer is, "Cannot answer." Do you mean by that answer that you couldn't tell how long the tube was, or you couldn't tell whether it was one inch long or a foot long or six feet long?

A. Couldn't tell how long it was, but presumably not exceeding a foot in length.

110 Q. Have you any distinct recollection as to how the air was exhausted from the chamber of the lamp?

A. Have not.

111 Q. Did you have an air pump in the shop for that purpose?

A. I have no recollection of one being brought into the shop.

112 Q. Was the lamp taken away from the shop for the purpose of exhausting the air out of it?

A. It was.

113 Q. Then you don't of your own knowledge know how the air was exhausted from the lamp or whether it was exhausted?

A. From my own personal knowledge, no.

114 Q. But you saw the lamp after it was sealed and saw it burning?

A. Yes.

115 Q. Did you seal any of them yourself at the shop in Centre street?

A. I did.

2975 116 Q. And the air was exhausted after the lamp was sealed?

A. Yes.

117 Q. Referring to the lamps exhibited by figure 7, Exhibit Sawyer No. 1, how many holes were made in the glass stopper?

A. In some cases we had three and in some four.

118 Q. The conductors went through two of the holes?

A. Yes.

119 Q. And when the lamp was filled with gas it was either put in through a tube in a central hole, the tube being smaller than the hole, to allow the gas or atmosphere to escape through the hole around the outside of the tube, or in cases where there were four holes in the stopper of the lamps, the gas was put into one hole and escaped through another?

Objected to as outrageously leading under the circumstances.

A. That was the arrangement as nearly as I can remember.

Cross-examination resumed:

120 X Q. What kind of sealing was that referred to in your answer to question 115?

A. We used the glass stopper; sometimes we used nothing but the ground stopper. Then, again, we used Canada balsam on the stopper. Some other kinds of lamps had a flat piece of glass to come right against the nose or bottle that we used—that was brought right up in contact and bolted to a wooden or metal flange on top of the flange on the muzzle, as shown in the patents already referred to.

2976 121 X Q. How did you seal the holes in the stoppers?

A. Was done by a plug—some by simple plug, others by a nut and bolt, one inside and the other outside, jammed up.

WM. SAWYER.

2977 Amos Broadnax, witness produced on behalf of Sawyer and Man, being duly sworn, says:

My name is Amos Broadnax; am fifty-three years old; reside in the city of Brooklyn, New York; am an attorney and counsellor at law; am attorney for Sawyer and Man in this interference.

Immediately after November 5th, 1878, I was at the shop of Sawyer and Man on the corner of Walker and Elm streets, in this city, in consultation with them about certain applications for patents which I was then preparing for them; that while there I saw illuminated an electric lamp substantially like that illustrated by the drawing, Sawyer Exhibit No. 4; the lamp was fitted with a section of carbon in the lighting circuit, that being the illuminating part of the lamp. The section of carbon was U or arch shape, resembling the letter U inverted. The carbon was held between the divided ends of the metallic part of the circuit in the lamp by clamps, like that shown in the drawing. Mr. Sawyer told me that the section of carbon in that lamp being the illuminating part of it was made of paper, and expressed the determination to get a patent for it. Whether the carbon was made of paper or not, I do not know. I did not see it made nor did I have the carbon in my hand. The lamp was sealed up and in place and illuminated. I was probably in the shop half an hour—certainly not more than that—talking with Mr. Sawyer about his lamp and his carbon. While I was there Mr. Sawyer arranged the light so as to throw a shadow of it on a screen, to show me that that form of burner cast no shadow.

So much of the above as relates to what Mr. Sawyer told him is objected to.

Mr. Broadnax adds that he was solicitor for the Electro Dynamic Light Company at that time, and was consulting Mr. Sawyer upon the subject of patents for which he was then applying, and 2978 fixes the date which he has mentioned of the time he called there by the date of the application for the patent 210,809, which application was prepared and filed by me.

Cross-examination by George W. Dyer, Esq.:

1 X Q. At the time of this visit to the Walker-street shop, about which you have testified, were these applications of Mr. Sawyer for patents for which he was then applying connected with incandescent electric lamps?

A. Yes, sir; they were.

2 X Q. How many of the invention were there?

A. There was an application for carbon to be used in incandescent electric lamps, which was afterward divided in an interference. There was also one for a switch; one for a commutator, too; was one also for an electro-dynamic generator, and, I think, another for a switch. Don't recollect any more.

3 X Q. How many applications did you prepare*d* for Sawyer and Man, together or individually, or William Sawyer, connected with the electric lights, after your visit to the shop before spoken of, and January 9th, 1880?

A. An electric motor I forgot to mention as part of my former answer.

A. I prepared between the times mentioned a switch, filed December 5th, for Sawyer and Man; also an application for carbons for burners, Nov. 22, 1878, for Sawyer and Man. An application for William E. Sawyer, a dynamic-electric generator. I have never prepared any application for William Sawyer. Filed also an application for switch Nov. 22, 1878. I recollect no others.

AMOS BROADNAX.

It is understood by the respective counsel that if Sawyer 2979 and Man wish to take further testimony, it shall be done after reasonable notice to Mr. Dyer, counsel for Edison, and if an enlargement of time shall be required for this purpose, no objection will be made to the same.

2981 NEW YORK, *April* 12, 1881.

Parties met pursuant to agreement.

Present: Counsel as before.

Counsel stipulate that no objection shall be *be* taken to the testimony about to be put in, on the ground that sufficient notice has not been given either as to the time or names of the witnesses.

LAWRENCE MYERS, witness produced on behalf of Sawyer and Man, being duly sworn, in answer to interrogatories propounded by Mr. Broadnax, testifies as follows:

1 Q. Please to give your name, age, residence and occupation.

A. My name is Lawrence Myers; am 48 years of age; reside at Plainfield, N. J.; my occupation is negotiating railroad bonds.

2 Q. Please to state whether you are acquainted with Wm. E. Sawyer and Albon Man; and if so, how long you have known them?

A. I am acquainted with both of them. Have known Mr. Man over twenty-five years; Mr. Sawyer about three years.

3 Q. Please state whether you are acquainted with a certain electric lamp known as the Sawyer and Man lamp?

A. The lamp they had up to the latter part of January, 1879, I was acquainted with, but don't know anything since.

4 Q. State whether or not you have seen that lamp in operation, and state where and when?

A. From the 13th December, 1878, to the 20th January, 1879, nearly every day, except Sundays, at 94 Walker street (on corner of Walker and Elm streets), in city of New York.

5 Q. Is that the first time that you saw the lamp in operation?

A. I saw the lamp in operation previous to that in Centre street, somewhere near the Tombs, but I can't say exactly where; I saw it there only once. 2983

6 Q. State, if you recollect, what form of burner was used in the lamp that you saw in operation in Centre street?

A. I do not recollect the form of burner; was the first electric light I ever saw, and was struck with the light, but don't recollect the form of the burner.

7 Q. Where did you next see the lamp in operation?

A. Corner Walker and Elm streets, at the place I have mentioned.

8 Q. State, if you please, what form of burner was used in the lamp that you saw at the corner of Walker and Elm streets?

A. There were several forms used; the principal ones were like those shown by this sketch. (Witness here makes a pen and ink sketch.) In this sketch, "*a*" in Fig. 1, represents a straight pencil of carbon; in Fig. 2, "*a*" "*a*" represent two straight pieces of carbon united at the top; in Fig. 3, "*a*" represents an arch-shaped carbon; and in all of the figures "*b*" represents larger pieces of carbon in which the burners "*a*" were held.

Sawyer Exhibit No. 5.
April 12. 1881.
W. H. B.
Notary Public.

Sketch offered in evidence as part of the witness' testimony, and the same is marked Sawyer Exhibit No. 5, Apr. 12, 1881, W. H. B., notary public.

(Here follow diagrams marked pp. 2980 and 2982.)

9 Q. Look at the drawing I now hand you, marked Sawyer Exhibit No. 4, March 17, 1881, and state whether you recognize that as representing one of the lamps you saw used by Sawyer and Man, corner of Walker and Elm streets, at the place referred to by you in previous answer?

A. Figs. 2 and 3 I recognize, and Fig. 4 is a side view of the same thing.

10 Q. State what these carbon burners were made of, if you know?

2984 A. Some were made of willow; some cut out of block of carbon, and rubbed down with sand paper, and many other things, but I can't say exactly what.

11 Q. Did you see any of these made?

A. Saw them making them from various things; put them in a kind of crucible in a furnace; *b*ut molasses, etc., on the material; don't know what all.

12 Q. Did you see Mr. Sawyer or Mr. Man cutting out these carbons to the form represented by the sketch and put them in the lamp?

A. I did; I saw Mr. Sawyer principally; I don't know that I saw Mr. Man put them in the lamp.

13 Q. State, if you know, whether any of these carbon burners that you saw in use there were made of carbonized paper?

A. I do not know.

Cross-examination of witness by Mr. DYER, of counsel:

14 X Q. Why did you go to Walker street every day to see these lamps?

A. Was requested to do so by the directors or trustees, whatever they were called, of the Electro-Dynamic Light Co.

15 X Q. Did you have, or propose to have, an interest in the invention?

A. I did have; was stockholder in the company.

16 X Q. How large were the carbon conductors which you have illustrated in your sketch, Exhibit No. 5, I mean the light-giving portion?

A. About the size of a good-sized knitting needle; I refer to those in Figs. 2 and 3 particularly; that in Fig. 1 was usually as small as he could make it; it varied, however; was sometimes as large as the others.

17 X Q. State, in detail, just what you saw Mr. Sawyer do when you saw him put carbons in lamps.

A. Seen him take a block of carbon and saw out the arch, sand paper or file it down to the size he wanted it, and put it into 2985 the holder and secure it there; file out these two pencils in Fig. 2, weld them together and put them into the holder; make the pencil in Fig. 1 and put it into the holder.

18 X Q. In each of these instances, after he had put the carbons into the holders, did he put them into lamps?

A. Yes.

19 X Q. After that was done did you see him do anything with the lamps?

A. Saw him put them on the brackets, connected by wires with the dynamo machine, and light it; that is the lamp.

Re-examination by Mr. BROADNAX:

20 Q. How did the lamps operate?

A. I think every one of them gave a good light.

21 Q. This place that you speak of, as being on the corner of Walker and Elm streets, in this city, was that the workshop of the Electro-Dynamic Light Co.?

A. Yes, sir.

22 Q. And Sawyer and Man were there directing the work being done there?

A. Yes, sir.

23 Q. Were you an officer of the company?

A. I was a trustee; I mean a director.

24 Q. During the time you spent at the shop, to which you have referred, was William Sawyer employed there; I mean the father of Wm. E. Sawyer?

A. Yes; during the whole of the time working on the lamps.

LAWRENCE MYERS.

2986 NEW YORK, *April* 12, 1881.

WILLIAM E. SAWYER, a witness produced on behalf of Sawyer and Man, being duly sworn and interrogated by Mr. BROADNAX, testified as follows:

1 Q. What is your name, age, residence and occupation?

A. My name is William E. Sawyer; my age 31 years; my residence is Hotel Devonshire; my occupation is an electrician.

2 Q. Please state whether you are the Wm. E. Sawyer, one of the parties to this interference.

A. I am.

3 Q. The subject-matter of this interference, as given by the Patent Office is: "The incandescent conductor for an electric lamp formed of carbonized paper;" please state whether or not you, in conjunction with Albon Man, have at any time made and used such a conductor.

A. We have; a great many times.

4 Q. State, as near as you can recollect, when it was that you and Mr. Man first made such a conductor.

A. Almost immediately after we went to 43 Centre street; should think about the 6th or 7th of March, 1878; might have been a little earlier or later.

5 Q. Give the circumstances that gave birth to that invention?

A. Before I became associated with Mr. Man I was associated with a Mr. James Flannagan at the coal and iron exchange, where I made a number of experiments in electric lights; I had a theory that the most perfect incandescent lamp would be one having the highest resistance and the least transverse mass, and I filed an application in the Patent Office for a chalk or some similar material held between two conductors, and containing in a little groove, running across from conductor to conductor, a powdered graphite or carbon to carry out this idea; I don't remember the exact
wording of the specification, but the patent was never
2987 granted, but is probably on file in the Patent Office now;
I spoke to Mr. Man of this idea, and sat down at my desk, 43 Centre street, and drew pencil marks on some ordinary foolscap writing paper, rather heavy, and I took two small copper wires and held them with my fingers on that while the generators were running; when he brought the wires very close together we could only get a little spark; then Mr. Man and I went around to a place where they deal in pure graphite, and got some samples; I'm not exactly sure what kind of paper we used, but think we laid the same kind of a piece of paper, or piece of blotting paper, and drew a heavy line with a pencil so as to make a creasing; then we filled the crease with powdered graphite and then brushed it off of the top so as to leave only what was in the crease; we had some trouble getting the current through that, but when we succeeded we charred or burnt the paper; I recollect that in looking at that I suggested to Mr. Man the charred parts that were left were so fine that it would probably make a good carbon; Mr. Man then took a piece of blotting paper; at first they were simply straight strips one-eighth to three-sixteenths in width and one-half to perhaps 1 inch in length. Mr. Man worked over them, rubbing and pounding them with graphite till he got them full of it. But the resistance was higher than what we had laid in the crease of the paper, and it was some time before we succeeded in making the current go through it. Of course this destroyed the paper. Am not sure at whose suggestion, but to prevent that we put the strip in a sealed globe filled with ordinary illuminating gas. I should not think it took over a minute to carbonize them. That blackened the globes. We treated those carbons in globes, *i. e.*, we passed the current through the carbons while a stream of illuminating gas was flowing through the globes. We concluded that that was a rather expensive way
of making carbons. Concluded that the best way to do
2988 it was to burn it out, the way as we done in carbonizing any
material. We had no facilities there, there being neither a stove nor a furnace. Mr. Man and father hunted around, found two old pieces of thick cast iron. One looked as it might have been the foot of some heavy piece of furniture or machinery. Had a hollow in it. The other, if I recollect rightly, was merely a flat piece of iron. We cut out pieces of blotting paper, and I believe

an old drawing we had. Mr. Man packed them into that with some common powdered gas-retort carbon which he got from Charles T. Chester in Centre street. Mr. Man took the box home (should say the made-up trap), and brought it over the next morning with the paper carbonized. I would take those, treating them and putting them in lamps. Most of the experimenting after that was done by Mr. Man himself. My own idea was that a much harder carbon would be better than those thin, fragile paper carbons, but Mr. Man preferred the paper. I think he does till this day.

6 Q. After you had the paper carbons made, state whether you treated them electrically in the presence of hydrocarbon for the purpose of consolidating and enlarging them.

A. Yes, I did.

7 Q. In making the carbons of the form you wanted them to use in your lamps, did you do that before or after the paper was carbonized?

A. Almost entirely before. When we wanted to expose the broadside to the light we had to cut them out before, but when exposed edgewise we could bend them after they were carbonized.

8 Q. Of what form did you make the burners of carbonized papers?

A. Generally in the form of a half circle or circle, but experimented with all conceivable shapes. Anything that would suggest itself as capable of allowing for the expansion and contraction of carbon.

9 Q. Can't you specify some of the different forms besides a circle and a half circle?

2990 A. We also used a straight piece; a V-shaped piece. These sketches which I hand you represent some of the forms of carbon which we made of paper. (Witness makes a sketch.)

Sketches offered in evidence as part of the witness' testimony, and is marked Sawyer Exhibit No. 6, April 12, 1881, W. H. B., notary public.

(Here follows diagram marked p. 2989.)

10 Q. Referring to this sketch you have made, state whether the letter "*a*" represents the enlarged part of the carbon that was used to hold the burner by in the supporting conductors.

A. It does in Figs. 1, 2 and 3; in the others it does not.

11 Q. How were the carbons represented in Figs. 4 and 5 held in the connecting conductors?

A. By clamping the ends; frequently we slit the ends of the conductors, which were sometimes of carbon and sometimes of metal.

12 Q. Do Figs. 1, 2 and 3 represent a side elevation of the carbon held in the lamp, and the others a kind of perspective?

A. Figs. 1 and 2 represent a side elevation; Fig. 3 was made with the flat side up, as shown in Fig. 6, in which "*b*" is an oblong square piece of carbon, screwed to metallic upright "*c*" by screw "*d*"; "*e*" is a piece of carbon cut in the shape shown, with a square slot through the lower jaw, through which an oblong carbon,

"*d*" passes. The connection with the carbonized incandescent part was made by the pressure of the weight of "*e*" on "*b*."

13 Q. Fig. 6, as I understand you, represents but one conductor, and one side of the connection between the conductor and the carbon section?

A. Yes; the other end of the incandescent conductor was held in precisely the same way; object was to get a very light though sure contact; the carbon- shown in figures 4 and 5 were held as
2991 shown in figure 7; in some made in that form I think, my father made a square cavity, which was packed with powdered carbon after the burner was put in; some of them were held as shown by the drawing Sawyer Exhibit No. 5; the wire shown in the bottom of the clamp, figure 4, was only used occasionally when the carbon was thin and the clamp imperfect in shape to bring the clamp up against the carbon burner.

14 Q. Does this drawing, Sawyer Exhibit No. 4, represent the lamp substantially in which you used those paper-carbon burners?

A. That represents the lamps as finally used, but it was only one of the many forms of lamps we used; and it particularly represents one of the lamps I took down at 94 Walker street, in the winter of '79–'80, to give to a friend of mine, Mr. Arnoux, of Arnoux & Hochhausen, on the Monday morning after the announcement of Mr. Edison's discovery, to show to him that we had previously invented that; this was, I think, on the 20th of December, 1879, that the Herald published that account about Edison; as soon as I got to my shop on Monday morning, which was about 9 o'clock, I took this lamp to Mr. Arnoux, and requested him to hand it to Mr. Shanks of the Tribune, to keep as an evidence that Mr. Edison was not the original inventor—to satisfy him; and I did it thus early that it could not be said that we possibly could have had time to manufacture it after Edison's announcement; this lamp was taken down in January or February of the same year, eleven months previous, having been broken; it might have been as early as December, 1878; Mr. Lawrence Myers saw this lamp in operation, and I think, saw it broken; it was taken down, I know, during Mr. Myers' stay there.

15 Q. Referring now to the paper carbons, some of which are represented in the sketch Sawyer Exhibit No. 6, state whether or not you put them in a sealed lamp and tested their practicability?

A. Yes, sir; we did.

2992 16 Q. Did you try any of the carbons illustrated by the drawing, Sawyer Exhibit No. 6, and, if so, which of them?

A. The carbons shown in figures 1, 2 and 3, and the half circle, were positively used; were sealed up and run; the great trouble with them was when we raised the temperature till we could get a bright light they would break; for this reason I preferred the harder carbons; we finally made them hard enough by treating them in hydrocarbon gas by the Sawyer-Man process.

17 Q. How long did they last in the lamp?

A. Untreated by the Sawyer-Man process would last from one second to ten minutes, if run up to give a good bright light; if run at a low temperature, they would run anywhere from an hour to one hundred hours; it depends entirely upon the temperature.

18 Q. State, as near as you can recollect, how long the best of the paper carbons you made at 43 Centre street would last in the lamp when raised to a temperature high enough to give a good bright light, after having been treated by the Sawyer-Man process.

A. Run at a power of about 25 candles they would last from 5 to 100 hours; once in a while we would get a lamp so perfect in every respect that it would seem to undergo no change after a long use; but generally they would fracture in from 5 to 20 hours, run at that temperature; the difference in the duration of the burners was due to both imperfections in the lamp and in the carbon; where the fracture alone occurs it must be due either to imperfection in the carbon or the effect of unequal expansions; when consumption occurs it is due to the imperfect charging of the lamp.

19 Q. State, as near as you can recollect, about how long you and Mr. Man continued your experiments at 43 Centre street.

A. Should think about two months; all the time we were there.

2993 20 Q. After you got through there, did you resume your experiments at any other place?

A. We moved from there to 2 Howard street, where I don't think we made any experiments on lamps, not having facilities for such experiments; we then moved in the fall of the year to 94 Walker street; I have got memoranda to show all these things; we moved to 94 Walker street during the 18th and 19th of October, 1878.

21 Q. State what, if any, experiments you made with carbonized paper carbons at 94 Walker street.

A. We employed an assistant who is dead now (Edwin L. Myers), and Mr. Man and I divided our work, Mr. Man experimenting with carbons and partly assisted by Mr. Myers; Mr. Myers conducting the charging of the lamps, and myself designing the different apparatuses connected with lamps, such as switches, dynamo machines and electrical measurements, etc., etc. I knew that Mr. Man continued carbonizing paper and live willow twigs and a good deal of such work generally; but I took no active part in it myself. He made the carbons and I used them. I don't think I ever did another thing in the manufacture of those carbons after I came in Walker street. We divided up our work and I had a general knowledge of what was going on. Almost every day, Mr Man would have some new carbons to offer. Made a good many by taking artist crayon (called the French willow carbon). He carbonized all kinds of woods. Mr. Lawrence Myers brought him in, I think, a willow twig which he carbonized. Among other forms of carbon Mr. Man made one of willow twig like Fig. 8, Sawyer Exhibit No. 6. What Mr. Man did not do in carbonizing different things can't be imagined, for he did nothing else but work on that about all the time.

22 Q. Please state whether or not you began and perfected the invention of the paper-carbon burners while you and Mr. Man were at 43 Centre street?

A. Yes, sir.

23 Q. State as near as you can recollect when it was, while
2994 you were at 43 Centre street, that you got the invention of
the carbonized paper burner perfected.

A. It was within two or three weeks after we got in 43 Centre street.

APRIL 13, 1881.

Parties met pursuant to adjournment.

Same counsel present as before.

Cross-examination of WM. E. SAWYER by GEO. W. DYER, Esq., of counsel for Mr. Edison:

24 X Q. Can you give the date when you moved to 43 Centre street?

A. About the first of March, 1878.

25 X Q. Who were the premises hired from?

A. From the engineer of the building. Am not positive; think his name was Porter.

26 X Q. What power did you use in that building in your experiments?

A. The regular power furnished to the building was shafting motion in the shop when I took it.

27 X Q. What kind of electric engine did you use at that place?

A. Had several engines there; Arnoux & Hochhausen had put one of their machines for electric lighting down in the engine-room, and they gave us permission to run wire from the shop down in the engine-room; then, afterwards, I had a Hochhausen electro-plating machine, which I bought, and another Hochhausen machine like the plating machine, but wound with a finer wire, which I borrowed; then there were two or three machines set in there for us to try; I think all of these were Weston machines (electro-plating) but we could not do anything with these Weston machines.

28 X Q. What was the electric power or capacity of each of these Arnoux & Hochhausen machines?

A. The light machine in the engine-room had a high electro-
motive force, comparatively had, I should judge, two ohms
2995 internal resistance; I never measured this, but judge from
another machine of the same make which I now have; that was the very first machine of that design which Arnoux & Hochhausen ever made; when put in there it was incomplete; they put it in for trial, to satisfy themselves of its capabilities; I think this machine was about equal to the intermediate size which they were making a year or two ago; I don't think they make just such a machine now; they said that the machine gave a light by the arc of 20,000 candles, but I should judge it only gave about 5,000 candles; the plating machines had a low electro-motive force; I don't think had more than one-half ohm's resistance; would give no voltaic arc at all; was driven at 1,500 revolutions a minute; the third machine was charged up by the plating machine; the armature was wound with fine wire, and was driven at a speed of about 4,000 revolutions a minute; only the armature coil being connected

with the lamps; is nothing to be said about the Weston machines; could not do anything with them; I mean they did not have electromotive force enough to overcome the resistance of the lamps.

29 X Q. How long did you occupy that shop?

A. I went from there to Washington, and gave it up, after being there two months and not over three; should think about two months—perhaps three months.

30 X Q. What force did you have in that shop?

A. Nobody employed in the shop but my father, William Sawyer, we had work done outside; we had some of the mechanical parts of the lamps made outside to save time in the shop; not very much done outside of the shop.

31 X Q. By whom was this outside mechanical work done?

A. Is difficult to answer; my father would have it attended to; one man in the same building did a good deal of it; Pearce & Jones, of William street, did some work; generally, father would go 2997 in some shop, take a man off his work, and put him on a little job; I can't tell you the date Pearce & Jones did work; it was while I was with Mr. Man; I get it from an account with Mr. Man, in which the dates do not appear; I think it was about the time we were in this shop—while I was first associated with Mr. Man.

32 X Q. In your answer to the fifth question you say, "I had a theory that the most perfect incandescent lamp would be one having the highest resistance and the least transverse mass;" what effort did you ever make to develop that theory, and when?

A. The first effort was in an application for a patent, the idea of which was a thin layer of powdered carbon on a refractory base. (Witness here makes a sketch which is made a part of his evidence, marked Sawyer Exhibit 7, April 13th, 1881, W. H. B., and proceeds as follows:)

(Here follows diagram marked p. 2996.)

Fig. 1 is a top view. Fig. 2 a side view. A is refractory base and a narrow groove running along the top opening in an enlarged space at the ends up into which the two conductors B B come. The carbon (powdered) was laid in the groove and packed in the end space; this may not be exactly in the form of the application but is substantially the same. This was a frequent subject of conversation—with some other applications I put in with Mr. Man.

33 X Q. Was this application to which you refer first in your own name or was Mr. Man associated with you?

A. Was in my own name—made some time before I knew Mr. Man. Think the application was not made earlier than October, 1877, and not later than January, 1878; I was continually filing applications, and as this was rejected it cleared my desk of all record of it.

34 X Q. What became of this application?

A. Was rejected and don't recollect the grounds.

35 X Q. Have you made any effort to amend it or keep it alive?

No 286.
E Light Co
v.
McK Light Co } p. 2996

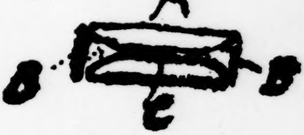

Fig 1

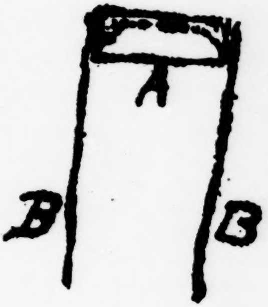

Fig. 2

Sawyer Exhibit 7.
April 13. 1881
W. L. B.
Notary Public

A. Undoubtedly it was amended, but I don't recollect
2998 what was done about it. Probably I considered the examiner's objection as good.

36 X Q. Did you prepare that application yourself?

A. I did.

Counsel for Edison gives notice that the production of this application will be required at the hearing of this interference.

37 X Q. What other effort did you make to develop the theory inquired of in 31 X Q.?

A. The effort to develop that theory and put it in practice was made with Mr. Man at 43 Centre street.

38 X Q. Has that theory ever been stated in any of your patents for electric lights or in those of Sawyer-Man?

A. I can't recollect whether it has been stated or not in any of the patents.

39 X Q. In another portion of your fifth answer you speak of carbonizing paper in what you call a "made-up trap," in which you packed the paper with "powdered gas-retort carbon;" what effect would that carbon have upon the paper?

A. No effect whatever. The carbon which was sold by Mr. Chester was purified carbon, which he sold at about $1 per pound. It was used to surround the paper and protect it from the air; more for this than any other purpose.

40 X Q. What effect did the subsequent treatment of these carbons, in presence of the hydrocarbons, have upon the carbons themselves. I refer to the 6th Q. and Ans.?

A. Two quite different effects. In some cases the whole mass of the original carbon would be hardened, and become homogeneous with the further deposit. In other cases the original carbon would remain unchanged and the deposit carbon could perhaps be broken off from it. This was due probably to difference in the manipulation. If the original carbon was heated up so as to drive
2999 out included gases, but not sufficient to decompose the hydrocarbon surrounding it, its pores will become permeated by the hydrocarbon which a quick impulse of current will decompose in the mass of the carbon, thus hardening it, and so on. But if the carbon is heated so hot as to decompose the surrounding hydrocarbon in the first place, then the original carbon will remain unchanged. By combining the two processes the original and deposit carbon may be made one and substantially the same.

41 X Q. What effect did this treatment have upon the resistance of the carbon conductors?

A. Would reduce the resistance in proportion to the extent of the treatment.

42 X Q. As a matter of fact, about how much was the resistance reduced?

A. Mr. Man's idea and mine upon that question of resistance began to differ; that is to say, my theory that the most perfect electric lamp would be one in which the incandescent conductor had the highest resistance and the least transverse mass was gradually abandoned by myself, while largely retained by Mr. Man. My present theory being that the most perfect electric lamp is one in which the incandescent conductor has not only the least transverse mass, but the least resistance. I soon began to reduce the resistance of my carbons to as low as an ohm; at present I make them only one-quarter ohm; therefore, I would treat the carbons so as to obtain a heavy deposit. Judging from the difficulty in getting the current through some of Mr. Man's carbons treated according to his ideas, they must have had as high as 100 ohms' resistance, but I don't recollect whether we made measurements of any particular ones. Answering the question directly, I should say that Mr. Man reduced the resistance in his carbon from fifty to seventy-five per cent. by the treatment referred to. This is an estimate, and not the result of measurement.

43 X Q. Did this diminution of resistance in the carbon conductors greatly increase the heat within the lamp?

3000 A. Increased the heat, but not in proportion to the diminution of the resistance.

44 X Q. Did this increased heat require the use, in some of your patented lamps, of radiators to convey away the surface heat?

A. In some of them, but don't use them in my present lamps, as they will stand the heat without.

45 X Q. Referring now to your answer to the 14 Q., and that part of it relating to the publication in the Herald of about December 20, 1879, did you make one or more replies to that article and publish them?

A. I believe something was said, but I don't recollect what now.

46 X Q What newspapers did you publish the replies in?

A. I don't know any particular newspaper; I believe I wrote to several newspapers; I think the very day that account of Edison's was published I sent the same article to every newspaper in New York.

47 X Q. Do you remember what newspapers published your article?

A. I think the Sun and the Tribune, or some other paper, but am not certain; I was continually writing to the papers; can't remember any particular article published in any particular paper.

48 X Q. Did you subsequently, and in a [short time, furnish one or more additional articles upon the same subject, which were published in the Sun?

A. Very likely I did. Refer to the previous answer with regard to my constantly writing to the newspapers.

49 X Q. Referring now to your 17th answer, could a lamp as described there, which would burn from one second to ten minutes be used in competition with gas or other commercial lights?

A. It could not; and at that time the invention was not so perfected in all respects, including the enclosing globe and mechanism, as to make the lamp suitable for any practical purpose. By
3001 mechanism I mean the general construction of the lamp, method of sealing conductors, etc. That is all the attach-

ments of the lamp and the general mechanical construction of the lamp.

50 X Q. Referring now to your 18th answer, could a lamp as described there, which would burn from 5 to 100 hours, be used in competition with gas or other commercial lights?

A. I think not.

51 X Q. Have you ever produced an electric incandescent lamp, with a paper-carbon conductor, which could be used in competition with gas or other commercial light?

A. We have produced a lamp of the kind described as capable of competing with gas as any other electric lamp produced with an incandescent paper carbon; I refer to heated carbons.

52 X Q. When and where did you produce such a lamp?

A. At 94 Walker street, substantially the same as in Exhibit No. 4 (Sawyer exhibit), referring to the copy of the drawing making part of the application for the patent. This was between the 20th October, 1878, to the 20th January, 1879. We had this lamp perfected before Mr. Lawrence Myers left.

53 X Q. How long did any of the lamps referred to in the previous answer actually burn?

A. One or two of them burned I think about 100 hours. The majority of them would fracture in about five hours. Nineteen-twentieths of them would fracture in about twenty hours. That is, of course, run up to the temperature which would give about twenty-five candle-light. That is about five times the light the Edison and Maxim lights were usually run at.

Redirect examination by Mr. Broadnax:

54 R. D. Q. Referring now to the lamps referred to in an-
3002 swer to X Q. 53, please state whether or no those lamps are
fitted with the same kind of paper carbons that you made at
43 Centre street?

A. Some of them were and some were treated with gas-retort carbon. Most of them were fitted with paper carbon. We were treating those lamps to get the greatest durability possible. The treatment was the same except we substituted liquid hydrocarbons for gaseous.

55 R. D Q. During your experiments at 43 Centre street, was William H. Church a frequent visitor there?

A. Yes.

56 R. D. Q. Did he witness those experiments with a prospect of interest in the invention?

A. I can't say what experiments Mr. Church witnessed. He was there every day in and out. Don't remember what his prospective interests in invention were.

W. E. SAWYER.

3003 APRIL 13TH, 1881.

GEORGE W. SAWYER, a witness called on behalf of Sawyer and Man, being duly sworn, and interrogated by Mr. BROADNAX, testified as follows:

1 Q. What is your name, age, residence and occupation?

A. My name is George W. Sawyer; am twenty years of age; reside at Earle's hotel; my occupation is working for the Eastern Electric Manufacturing Company.

2 Q. Please state where you were employed during the months of October, November and December, 1878.

A. 94 Walker street, by the Electro-Dynamic Light Company.

3 Q. State whether you are acquainted with Wm. E. Sawyer and Albon Man.

A. I am, with both of them.

4 Q. State what relation you are to either of them, if any.

A. Brother of Wm. E. Sawyer.

5 Q. State whether or not, during that time you were employed at 94 Walker street, you saw there in operation what is known as the Sawyer and Man electric lamp.

A. I did.

6 Q. State what your duties were at the works of the Electro-Dynamic Light Co., at 94 Walker street.

A. Employed to take care of the boiler and engine and operate them.

7 Q. State whether or not, during the time you were employed there, you saw Mr. Wm. E. Sawyer or Albon Man carbonize any paper for the purpose of making carbon burners for their electric lamp.

A. Yes.

8 Q. Which of them?

A. Mr. Man.

9 Q. Who assisted Mr. Man?

A. Edwin L. Myers.

10 Q. Where is Edwin L. Myers?

3004 A. Dead, I believe.

11 Q. How did Mr. Man carbonize the paper?

A. By first cutting the paper to the proper shape; then put it in the retort made of fire-clay, or graphite; one was made of fire-clay, and one of graphite; put it in the boiler furnace and made it red hot; then took it out and let it cool gradually; then took the carbons out and used them in the lamp.

12 Q. Did you see him put them in the lamps?

A. Yes.

13 Q. Which month was it you saw them do this?

A. In the latter part of October, and in the months of November and December.

14 Q. What shape was the retort?

A. One, I believe, was three-cornered, and one was round; was about five or six inches long; they put the papers in the retort and then filled up with powdered carbon.

15 Q. How many lamps did you see them put these carbons in?

A. A number of them; I could not say how many.

16 Q. Did you see those paper carbons illuminated in the lamp?

A. Yes.

17 Q. How long were they illuminated?

A. I can't say how long; I did not pay any special attention to that.

18 Q. State, as near as you can recollect, how long you had been at work at 94 Walker street before you saw Mr. Man carbonizing paper as you have stated.

A. Very shortly after we moved there; how long I cannot say.

19 Q. Was it a week or two weeks?

A. Think it was about a week, it was very shortly after we moved there.

20 Q. Did you see Mr. Man or your brother, Wm. E. Sawyer, making or causing to be made any carbonized paper for burners for their electric lamps at any other place besides 94 Walker street, and if so where?

3005 A. I think at 43 Centre street, in April or March.

21 Q. Was you employed at 43 Centre street?

A. Yes, sir.

22 Q. In what capacity?

A. As errand boy.

23 Q. Did you see them carbonize the paper?

A. No, sir.

24 Q. Did you see the paper after it was carbonized there?

A. Yes.

25 Q. How do you know that the paper was made of carbon?

A. They laid on the table, and I was told they were carbonized paper.

26 Q. Who told you they were carbonized paper?

A. My brother, Wm. E. Sawyer.

27 Q. Did you see any of these carbon burners that your brother told you were made of carbonized paper used in the electric lamps at 43 Centre street?

A. We had several lamps in use there, but I don't know whether the carbons used in the lamps were made of paper or not.

28 Q. Was it at the time that your brother, W. E. Sawyer, and Albon Man were experimenting with their lamps at 43 Centre street that your brother told you that the carbons were made of carbonized paper?

A. Yes, sir.

Cross-examination by Mr. DYER, of counsel for Mr. Edison:

29 X Q. Then you do not know, of your own knowledge, that any carbonized-paper conductors were made at 43 Centre street?

A. No, sir.

30 X Q. Where was the boiler-room at 94 Walker street—what part of the building?

A. In the N. W. corner of the workshop.

31 X Q. Was all the carbonizing done there, done in the furnace of the boiler?

3006 A. Yes; all that was done in the shop.

32 X Q. Were other things carbonized besides paper?

A. Yes.

33 X Q. What other things?

A. Willow twigs.

34 X Q. Anything else?

A. Not that I remember.

35 X Q. What was the proportion of the paper to the twigs?

A. Could not say.

36 X Q. How far away from where you were working were the materials prepared for carbonization?

A. Perhaps 20 feet.

37 X Q. Did you see any paper packed in retorts for carbonization at that shop?

A. Yes.

38 X Q. Who packed it?

A. Mr. Man and Mr. Edwin L. Myers.

Redirect examination by Mr. BROADNAX:

39 R. D. Q. State, if you recollect, what kind of paper was used for carbonization?

A. Paper that looked like blotting paper.

GEORGE W. SAWYER.

Counsel for Sawyer and Man gives notice that the testimony in behalf of Sawyer and Man closes here.

3007 NEW YORK, *Sept.* 22, 1881.

Parties met pursuant to agreement.

Present: Amos Broadnax, counsel for Sawyer and Man; George W. Dyer, counsel for Thomas A. Edison.

Rebutting Testimony Taken on Behalf of Sawyer and Man.

WILLIAM H. CHURCH, a witness produced on behalf of Sawyer and Man, being called and duly sworn, in answer to interrogatories propounded by Mr. Broadnax, deposes as follows:

1 Q. You have heretofore been examined in this case, have you not?

A. I have.

2 Q. I read to you questions and answers 41 and 42, folio 122, printed case, of your previous examination-in-chief.

Counsel reads questions and answers.

Please state if you have any corrections to make to your answers to those two questions, and if so, make such corrections to those answers as you may desire.

Counsel for Edison objects to the above question, and whatever answer may be made to it, for the reason that it is not properly rebutting testimony.

A. My observations were made in Centre street, before they moved to Howard street, as I did not see any work done in Howard street on carbons. I occasionally looked in there—perhaps three or four times—as I was living out of town, and came in town only occasionally.

2½ Q. Then, as I understand you, you first saw the paper 3008 carbons used at 42 or 43 Centre street, as you have testified, and the next time you saw them used was on the corner of Walker and Elm streets; is that correct?

Same objection.

A. Yes, sir.

3 Q. And that you did not see any paper carbons used at Howard street, that you know of?

Same objection.

A. No, sir; not that I know of. But I saw a lamp there burning, which I recognized as one I had seen put up at Centre street; and was told that it was the same lamp by both Mr. Man and Mr. Sawyer.

4 Q. Do you mean an incandescent electric lamp?

Same objection.

A. Yes, sir.

5 Q. Did that lamp have in it a carbon burner?

Same objection.

A. Yes, sir.

6 Q. But you don't know what kind of carbon?

Same objection.

A. I can't swear as to what kind of carbon it was.

7 Q. This lamp that you saw burning in Howard street, and which you say you recognized as the same lamp that you had seen at 42 or 43 Centre street, did you see that lamp burning at 42 or 43 Centre street, I mean did you see the lamp illuminated, and if so, how often and how long did you see it there in Centre street?

Same objection.

A. I saw it very frequently, and watched it quite a number of hours all told. I saw it there burning continuously for two or three hours at a time, and sometimes during the whole afternoon.

3009 8 Q. State, if you know, how long that lamp was in operation in Centre street; I mean how many days or hours was it illuminated?

Same objection.

A. I should think about three weeks in the month of May; I don't recollect that I saw it every day, but I saw it a good many times during that time in operation.

9 Q. State, if you know, whether that lamp was a sealed lamp filled with nitrogen gas.

Same objection.

A. I know it was sealed and filled with nitrogen gas.

10 Q. State, if you know, whether during three weeks in which you say you saw the lamp in operation, the lamp was unsealed and refilled or whether it was continued right along.

Same objection.

A. It was continued right along and never taken apart.

11 Q. State, if you know, whether the carbon was renewed in the lamp, or whether it was the same carbon that you saw illuminated during the whole of the time you saw the lamp in operation.

Same objection.

A. No part of the lamp was renewed. The same carbon remained in from the first to the last.

12 Q. State if you know, whether the lamp to which you have been referring is still in existence.

Same objection.

A. I think it is, but don't positively know.

13 Q. State whether or not you saw this same lamp burning on the corner of Howard and Centre Sts., at the workshop of
3010 Sawyer and Man; and if so, state how often and how long, as near as you can recollect.

Same objection.

A. I saw that lamp burning several times in Howard St., corner of Centre St. I saw it several times, an hour or so at a time, illuminated.

14 Q. State whether you saw this same lamp illuminated at the workshop of Sawyer and Man, on the corner of Walker and Elm Sts.

Same objection.

A. I don't remember seeing that particular lamp there.

15 Q. Referring now to this lamp, about which you have been testifying, you say you saw it in operation at 42 or 43 Centre St. State whether or not you saw any more lamps of the same construction at 42 or 43 Centre St., in operation.

Same objection.

A. I did.

16 Q. How many of those lamps did you see there in operation?

Same objection.

A. There were others of that kind, but I don't remember how many. They were trying to get a better plan of sealing, but that one before testified about was the most satisfactory lamp.

17 Q. Referring now to the lamp, the chamber of which consisted of a Florence flask, as illustrated in your sketch, figure 7, Sawyer Exhibit No. 1, state as near as you can how many lamps you saw made of that *that* kind in Centre St., and illuminated at any one time.

Same objection.

A. Five or six.

3011 18 Q. How often did you see these lamps illuminated?

Same objection.

A. Frequently. I can't say how often. They were experimenting with carbons in those.

19 Q. You mean by that that they were trying to obtain a satisfactory carbon to burn in their lamps?

Same objection.

A. I do.

20 Q. State, if you know, whether they did finally obtain a satisfactory carbon to use in their lamps, at 42 or 43 Centre St.

Same objection.

A. I think they did.

21 Q. State, if you know, whether they finally succeeded at 42 or 43 Centre St., in obtaining a satisfactory paper carbon to use in their lamps.

Same objection.

A. I think they did.

22 Q. Before they moved away from 42 or 43 Centre St., did they finally succeed in getting a satisfactory sealing for their lamps, sufficient to make a good practical lamp?

Same objection.

A. In the one lamp to which I have referred it was satisfactory.

23 Q. In answer to cross-question 3, page 32, folio 127, you say: "In Centre St., No. 42 or 43, as designated this morning, the first lot was in September, in Howard St.; one lamp put up in May was rather crude. I*n* the lamp you referred to in that answer as being "rather crude" the lamp about which you have been testifying this morning?

Same objection.

3012 A. It is.

24 Q. In what respect did you consider that lamp crude?

Same objection.

A. It wasn't a nicely finished lamp. It looked rough.

25 Q. Was that the only lamp you saw in operation corner of of Howard and Centre streets?

Same objection.

A. It seems to me I saw this lamp with two others, put up on the same plan as that one in circuit there in Howard street. I think one had a different form of glass globe—having a bulb at the top like Fig. 1, Sawyer Exhibit 2.

26 Q. Then did you mean by your answer 3 of cross-examination in your previous testimony, that the first lamps you saw put up at 42 or 43 Centre street, as stated in the answer, and that the lamp which you say was put up in May, and was "rather crude," was one of the lamps that was put up at No. 42 or 43 Centre street?

Same objection.

A. Yes, sir; it was.

27 Q. And the next lot of lamps which you saw was in September, in Howard street, of which you think there were three, one of which was the lamp which you saw in No. 42 or 43 Centre street.

Same objection.

A. Yes, sir.

28 Q. Question 8 of your cross-examination, page 32, is as follows: "The first lot put up in Howard street, were they all alike?" Answer: "Yes, as I remember."

Please state whether you have since ascertained that you
3013 were mistaken in saying that they were all alike.

Same objection.

A. They were all alike excepting that one that was brought up from 42 or 43 Centre street.

29 X Q. I do not yet understand exactly what you mean by your answer to question 41 in chief, page 31. The question is as follows:

"Please state when it was that you first saw the paper carbons used in the lamps—not experimentally, but in the lamp as perfected."

Your answer is: "In September, 1878."

What did you mean by that answer? Please state exactly what you meant, or what your understanding of the question was.

Same objection.

A. I saw the first satisfactory lamp put up in 42 or 43 Centre street, and saw it burning there. I afterwards saw the same lamps, with others better made, in Howard street, in September, and subsequently I saw other lamps with the paper carbon in Walker street, corner of Elm street, in December, 1878.

30 Q. Then, as I understand you, the first paper carbons that you saw used, that you knew were paper carbons, were in 42 or 43 Centre street, in lamps like that illustrated by Fig. 7, Sawyer Exhibit No. 1?

Same objection, and the additional objection that the witness has not said anything of the sort indicated in the question.

A. That is correct. The experiments with paper carbons were made at 42 or 43 Centre street, prior to the first of June, 1878, in the lamps represented by Fig. 7, Sawyer Exhibit No. 1?

31 Q. When did you next see the paper carbon used
3014 knowing that it was paper carbon, in the Sawyer and Man lamp?

Same objection.

A. In December, 1878, in Walker street, corner of Elm street, in the lamp as perfected.

32 Q. You say that you saw at 42 or 43 Centre street, five or six of the lamps represented by figure 7, Sawyer Exhibit No. 1. Please state whether you saw all these lamps illuminated at one time.

Same objection.

A. I did.

33 Q. Please state how long you saw them illuminated at one time.

Same objection.

A. Sometimes a few minutes; sometimes much longer. They were experimental for the purpose of getting a good carbon. Carbons were put in of different shapes and forms. They sometimes might have lasted as long as an hour. I didn't always stay to see how long they lasted.

34 Q. Did you ever go away and leave them burning?

Same objection.

A. I have.

35 Q. When those five or six lamps were all in circuit, would they all go out at once at any time while you were there watching them?

Same objection.

A. No, sir; I don't remember ever seeing them all go out at once.

36 Q. How many of them have you seen go out while you were watching them?

Same objection.

3015 A. I have seen them all go out while I watched them, but not at the same time.

37 Q. State, if you know, why they went out.

Same objection.

A. The carbon seemed to consume; which might have been from a defect in the carbon or a defect in the sealing or filling the lamp.

38 Q. Referring still to these same lamps; how many of them were provided with carbonized-paper burners?

Same objection.

A. I could not tell the number. These lamps were taken down and fitted up again and again. Changes in the form—and in other respects—in the carbons were continually made.

39 Q. Do you know of your own knowledge that any of these five or six lamps that you say you saw in circuit at one time were provided with carbonized-paper burners?

Same objection.

A. Yes, sir.

40 Q. How long is the longest that you saw any one of these lamps burn that was provided with carbonized-paper burners?

Same objection.

A. I have watched them from three-quarters of an hour to an hour.

41 Q. I understand you to say that you did not see any lamps illuminated with paper-carbon burners, at the shop on the corner of Howard and Centre streets, that you knew to be paper carbon. Is that correct?

Same objection.

A. Yes; I did not know what the carbons were made
3016 of that were used in Howard street, corner of Centre street.

42 Q. Referring now to the shop corner of Elm and Walker streets, where you say you saw the paper-carbon burner used in the perfected lamp, in December, 1878, please state how long you saw the perfected lamp provided with a carbonized-paper burner illuminated at any one time in that shop, corner of Elm and Walker streets?

Same objection.

A. From two to three hours; as long as I could stay there to watch it; passing in and out, I have seen it burning the entire day, but have never watched it more than two or three hours at a time without leaving the office and then going back again.

43 Q. Was this in December, 1878?

Same objection.

A. Yes, sir.

44 Q. State, if you know, whether or not Sawyer and Man used an illuminating conductor in their lamp made of any other material than carbon.

Same objection.

A. Never to my knowledge.

45 Q. Please examine the lamp I now hand you, and state if you recognize it as the lamp you saw at No. 42 or 43 Centre street, that

was afterwards taken to the shop on the corner of Howard and Centre streets, and that you there saw in operation.

Same objection.

A. I recognize it as that lamp.

Lamp is offered in evidence and is marked Sawyer Exhibit "Lamp No. 1," W. H. B., notary public, Sept. 22, 1881.

3017 Same objection is made to the introduction of the exhibit.

Counsel for Edison gives notice that at the hearing he will move to strike out all of the above testimony, for the reason that it is either new matter or cumulative, and in no sense rebutting; and not waiving any objection to same, cross-examines this witness.

Counsel for Sawyer and Man replies that the testimony is rebutting, and intended so to be, in so far as it meets any presumption on behalf of Edison that Sawyer and Man did not produce a patentable lamp in the spring of 1878. The rest of the testimony is merely explanatory, and intended merely to correct the errors of the witness in matters of date in his previous testimony.

Cross-examination by GEORGE W. DYER, of counsel of Edison:

46 X Q. How do you know this is the same lamp which you saw at Centre street in May, 1878?

A. I know it from a recollection of it: these wooden plates on the bottom is one thing that calls it back to mind, and its general appearance is familiar; I have watched this lamp a great many hours.

47 X Q. Have you ever seen any other lamps like it?

A. Not exactly.

48 X Q. How does this differ from the other lamps that were not exactly like it?

A. In the construction of the base; the sealing and also in the upper structure of it; and then, other lamps which I remember were not as tall—did not have so long a glass tube.

49 X Q. Wherein does the construction of the base differ from that of the other lamps?

A. Instead of the wooden plates, a corresponding metal
3018 ring to the one through which the screws are passed was
placed under a wooden cushion and screwed up; then a spun-metal cap would cover the whole of the sealed portion of the lamp.

50 X Q. How does it differ in regard to sealing from the other lamps?

A. I do not know that it differs in any respect.

51 X Q. How does it differ from the other lamps in the upper structure?

A. The cross-bar at the top differs in this, that a spring was placed in the back in the others, which takes the pressure off from the end of the carbon. The spiral conductors were, in some instances, made of straight pieces and in other shapes; in the other lamps the conductors were not in true coils.

52 X Q. You are confident, then, are you, that this was the only lamp Sawyer and Man ever made just like this?

A. I am.

53 X Q. I understand you, when you saw this lamp burning, it had been filled with gas; is that correct?

A. Yes, sir; it is.

54 X Q. How do you know it was filled with gas?

A. I saw it put in circuit to be filled with gas—that is, this very lamp.

55 X Q. Do you know that it was filled with gas?

A. Yes, sir.

56 X Q. Did you see it filled with gas?

A. I did; I saw the lamp placed in the circuit to be filled; I saw gas made; I saw gas bags used in the circuit; I saw this lamp connected to the pipes between the gas bags through which the gas passed from the full bag at one end to the empty bag at the other end of the circuit, and so on, back and forth, through the lamp.

57 X Q. Do I understand you correctly that this particular lamp was used for the purpose of experimenting with a variety of carbons?

A. No, sir.

58 X Q. Was it used for experimenting at all, and, if so, for what experiments?

3019 A. It was an experimental lamp for the purpose of exhausting and sealing and filling with gas.

59 X Q. What kind of exhausting?

A. My impression is that it was by displacing the atmosphere by another and heavier gas that would not support combustion of the carbon.

60 X Q. How frequently did you see this lamp filled with gas at Centre street (No. 42 or 43)?

A. The lamp was never filled but once.

61 X Q. How many times have you seen this lamp burn in No. 42 or 43 Centre street?

A. Quite a good many days; I couldn't tell the exact number, but I should say between two and three weeks. This was in the month of May, 1878.

62 X Q. How many different carbons did you probably see burned in this lamp?

A. Only one.

63 X Q. Did you see that carbon put into the lamp?

A. No, sir.

64 X Q. Do you know of your own knowledge what kind of carbon it was?

A. No, sir.

65 X Q. Explain how this lamp was used in experiments in sealing at Centre street (No. 42 or 43.) when it was filled only once with gas.

A. It was not thought at the time this lamp was put up that it would show any such life as to the carbon as was experienced in its use. It was the expectation to remove the plates and experiment further in the process of sealing; but the life of the carbon extended through several months, and showed that the sealing was perfect.

66 X Q. How was this lamp sealed?

A. By the glass plate being ground perfectly to fit the end of the tube (I am not sure whether he put any balsam or not between the wooden plates,) all of which with the ring around the flange, were screwed together very perfectly.

67 X Q. Were you at the shop at Centre street all the time
3020 while this lamp was there?

A. I was in and out; in there every day—a great deal of the time.

68 X Q. What proportion of each day do you think you were there?

A. From two to three hours, and frequently more than that.

69 X Q. How do you know that the lamp was not unsealed and sealed up again while you were away from the shop?

A. Because nitrogen gas was not made every day; when they made it they used it immediately; I was generally there when it was made, and knew for what lamps it was intended.

70 X Q. Were many lamps made after this was made?

A. Of course; a great many.

71 X Q. Why were not other lamps made like this that worked so well?

A. Because they endeavored to improve upon the style and appearance of the lamp.

72 X Q. Did they improve upon the style and appearance of the lamp?

A. They did.

73 X Q. Do any of the exhibits in this case show such an improvement; if so, point them out?

A. The next lamp that was made was like Fig. 1, Sawyer Exhibit No. 2, the globe of which was not so long and was enlarged at the top, and the spiral conductor to keep the base of the lamp cool was made in a different shape; the two spirals being made together so as to form apparently only one spiral. Then the sealing of the lamp was covered with a metal cap, spun up so as to cover the whole base of the lamp. Fig. 2 was considered an improvement in having two uniform spirals separate, and the glass tube was not so long. Fig. 3 had, instead of spirals, straight strips put in for the conductors so as to obtain the same length of radiating conductor to keep
3021 the base of the lamp cool. Fig. 4 was another form of making these conductors, and also of holding the carbons which were circular in shape instead of straight, as represented in the other lamps referred to.

74 X Q. What degree of luminosity was given off by this lamp when you saw it burning in Centre street?

A. Sufficient to light a room of the size of the one in which we are sitting, brilliantly.

75 X Q. When you saw this lamp burning in Howard street, had any change been made in it?

A. No, sir; none whatever.

76 X Q. Was its luminosity as great as before?

A. Yes, sir; it was.

77 X Q. You testified in this case in March last, did you not?

A. I did.

78 X Q. Have you, since testifying at that time, read the testimony which was given in behalf of Mr. Edison?

A. I have not. I heard a portion of Mr. Edison's during the two days which I was there; a little while each day; I was engaged in conversation during the greater part of the time I was there. I have no recollection of Mr. Edison's testimony.

79 X Q. What has occurred to refresh your memory since you testified in March last?

A. In looking over my testimony soon after it was printed, I noticed a little discrepancy in the dates to which I had testified as having witnessed these experiments, and I called Mr. Broadnax's attention to it.

80 X Q. When did you next see this Exhibit "Lamp No. 1," after you saw it at Howard street?

A. I saw it at the office of Lorillard & Co., in the private safe of Mr. Man. It was in the month of December, 1878, or January, 1879 (probably January, 1879); and I have since seen it in his private safe several times.

81 X Q. When you saw it there at Howard street, had it been broken?

A. It had.

3022 82 X Q. And mended again?

A. Not then. It wasn't mended till after Mr. Man took it away.

83 X Q. When did you first see it after it was mended?

A. I think in December, 1878, or January, 1879; as I have before testified.

84 X Q. How long was it at Howard street before it was broken?

A. I should say two or three months. It's my impression I saw it burning in Howard street in September. I certainly saw it burning in the shop in Howard street.

85 X Q. When you first saw it after it was mended, did it have the paper inside which is now there?

A. Yes, sir.

86 X Q. Have the paper in there before it was broken?

A. Yes, sir.

87 X Q. Referring to your second question and answer in this examination, what kind of lamps did you see paper carbons used in at 42 or 43 Centre street?

A. In the experimental lamps where Florence flasks were used; as illustrated by Fig. 7, Sawyer Exhibit No. 1.

88 X Q. And what kind of lamps did you see paper carbons used in at the corner of Walker and Elm streets?

A. In the lamps represented in the Sawyer Exhibit 4, Fig. 2.

Cross-examination adjourned until 11 o'clock, Friday morning, September 23d, 1881.

3023 NEW YORK, *September* 23, 1881—11 o'clock a. m.

Met pursuant to adjournment.
Present: Counsel as before.

Cross-examination of WILLIAM H. CHURCH continued by Mr. DYER:

89 X Q. Did you see the paper carbons used in any other form of lamps besides that shown in Fig. 7, Sawyer Exhibit No. 1, at Centre street?

A. Not that I am aware of.

90 X Q. Did you see used in the lamps there any carbon conductors not made from paper?

A. Yes, sir.

91 X Q. How did the number of these lamps compare with those in which paper-carbon conductors were used?

A. I don't know.

92 X Q. The paper carbons which you saw used at the corner of Walker and Elm streets, in lamps like Fig. 2, Sawyer Exhibit 4, were these treated or untreated carbon conductors?

A. They were treated by the Sawyer-Man hydrocarbon process.

93 X Q. How was it as to those that were used in Centre street?

A. I don't remember. My recollection is not distinct about it.

94 X Q. In answer to the 21st question you say that you think that "they finally succeeded at 42 or 43 Centre street in obtaining a satisfactory paper carbon to use in this lamp." What kind of a carbon was this to which you refer in this answer—was it a treated or an untreated carbon?

A. I think it was a treated carbon.

95 X Q. Can you designate the form of these carbons by any sketches which are exhibits in this case?

3024 A. In Sawyer Exhibit No. 1, Fig. 1, a straight pencil is the only one that rests in my memory as the form that they used in Centre street. The other representations, Figs. 2, 3 and 4, were experimental.

WM. H. CHURCH.

Sworn to and subscribed before me this 23d day of September, 1881.

WILLIAM H. BROADNAX,
Notary Public, Kings Co., N. Y.

Certificate filed in New York Co., N. Y.

3025 NEW YORK, *Sept. 23d,* 1881—1 o'clock p. m.

Parties meet pursuant to agreement.
Present: Counsel as before.

ALBON MAN, recalled and resworn, and being interrogated by Mr. BROADNAX, deposes as follows:

1 Q. Please to examine this lamp, marked Sawyer Exhibit "Lamp No. 1," and state whether or not it is one of the Sawyer and Man

electric lamps; state when it was made and how long it was operated.

Counsel for Edison objects to the above question, and whatever answer may be made to it, for the reason it relates to matter not in the nature of rebutting testimony.

A. It is one of the Sawyer and Man lamps. It was made under my direction, in consultation with Mr. Sawyer, and completed, according to the best of my recollection, about the last of March or first days of April, 1878, in substantially its present form. It was run for a few days after completion, successfully, and without apparent consumption of the carbon, at 43 Centre street, in this city, and exhibited to a great number of people. Then by an accident the top of the glass tube or globe was broken off, and I took it down and took the glass globe or tube to Mr. Hahn, in North William St., and he put back the piece and mended the globe or tube; in doing so the top of the globe or tube was smoked or discolored. As it appeared to be very thin, I would not allow Mr. Hahn to remove the discoloration with acids, but allowed it to remain in the condition in which it now is, except cleaning it out with water and ether. Before this time the two conductors that lead into the lamp and support the soapstone diaphragm, were arranged in concentric spirals, instead of in 3026 two separate spirals as now. The lamp was operated before the accident, I should say, about one week. It took about a week to get it restored and ready to set up again in the exact condition in which it now is, except the incandescent portion or light-giving carbon, and except that the lamp is not now sealed nor filled with any gas except the atmosphere, and except, possibly, a piece of potassium which I think has been removed from the lamp. I, with the aid of Mr. William Sawyer, set up the lamp again about one week after the accident to the glass globe or tube occurred, to the best of my recollection, in the second, or possibly the third week of April, 1878. I myself filled it with purified nitrogen gas, placing a piece of metallic potassium inside it in a cloth bag, sealed it up and set it running. In the course of filling, lighting it up several times, and heating it thoroughly, both inside and out, by the current and with the heat of a furnace to drive out occluded gases from the incandescent portion of the lamp, and adherent gases from the glass and interior works of the lamp, I then set it running, and it was run continuously every day except Sundays, until the latter part of May or the first of June, when we left 43 Centre street, and exhibited to a large number of people. It ran all day and sometimes in the evening, and as long as anybody wanted to see it, at high incandescence, lighting up well the whole interior of a black and grimy and gloomy room, some 25 or 30 feet in width and about 35 or 40 feet long, at this place, No. 43 Centre street. I then took the lamp to my office No. 3 Mercer street, and put it in my safe and set up a dynamo machine at Jackson's iron works, on the southwest corner of Howard and Centre streets, ran connecting wires there and made a stand for the lamp in a dark portion of the shop, and from time to time during the summer, until about the last of August

or first of September, I took the lamp there a great many times and ran it and exhibited it to my friends. The lamp was filled with purified nitrogen gas at atmospheric pressure. Upon one occasion
3027 at Jackson's place, I was called away and left the lamp burning, and was unable to go back for it, so that it ran there the greater portion of the day. The luminosity of the lamp at that place was somewhere from about 100 to 150 candle power. About the last days of August or first days of September, and I think in August, the lamp was taken to a room under Arnoux & Hochhausen's shop at the northwest corner of Howard and Centre streets, which we had hired to work in. This may have been in the third week of August, 1878. It was there run and exhibited by myself, Mr. William E. Sawyer and Mr. George Sawyer, and Mr. Frank Holbrook and Mr. Edward Myers, until, I should say, the last week of September, 1878, developing a light of from a 100 to 200 candle power. I think it ran up a good part of the time to 200 candles, but a part of the time the machinery was slowed in the shop, so that it did not run at more than 100 candles, and a part of the time a portion of the current was shunted off to show the operation of our switches, and the lamp was run at varying light, from simple red heat up to over 200 candles. The carbon in the lamp was made from a piece of French carbon, worked down by hand and treated in hydrocarbon gas, according to the process subsequently patented by Sawyer and Man. During the last two or three days that the lamp was run a small perforation or pit appeared in the carbon, showing a defect in it. This went on until a very minute hole was made clear through the carbon (through which light could be seen on holding the lamp up to the window and examining it with a magnifier) when the operation seemed to cease. The lamp continued to give light and to be run after this as before, and was run up to the same light-giving power and exhibited as before for two or three days. It will be seen that the soapstone diaphragm does not touch the sides of the glass tube and is not supported by spiral springs against the interior or the tube, as in our other lamps,
3028 but will vibrate, the soapstone striking against the sides of the tube if the lamp is not carefully handled. It stood upon a bracket placed upon a board partition which was not steady or firm, and through which the outer door of the room passed. The wind blew the door together violently, shaking the partition and the lamp supported by it, and the jar of the diaphragm against the glass broke the carbon at the point where the perforation, to which I have referred, had been. It was the same carbon that was first put in the lamp, and was always used in it up to that time. I took the lamp down myself, with the aid of Mr. Frank Holbrook or Mr. Myers, I don't recollect which, and found the pressure of the gas in the lamp was very slightly, at that time, in excess of the atmospheric pressure. Mr. Holbrook or Mr. Myers, whichever it was, and myself had prepared some test, I cannot now recollect what it was, to ascertain if possible, whether there was any gas compound of hydrogen or nitrogen in the lamp. We found none by the chemical test that had been prepared. We then, after making this trial,

placed a rubber tube over each of the tube conductors in the lamp, and blowing into one slightly held the other at our nostrils, endeavoring to see if there was any smell to the gas which came from the lamp. I had suspected that there might be a smell of bitter almonds or peach blossoms, but we could neither of us detect any. In speaking of this I should say it occurred before any opening or taking down of the lamp other than I have described. I completed the taking down of the lamp, took out the piece of potassium that was in it, put in a new carbon, stood it up loosely as it now is, took it and put it in my safe at No. 3 Mercer street, where it has remained ever since (except being taken over to the corner of Walker and Elm streets to show it to some one occasionally) until I gave it to Mr. Broadnax a day or two since. In numerous tests made for the purpose, we failed to detect any gas in the globe other than the nitrogen with which the globes were originally filled at
3029 whatever stage or age of the lamp the test was made. And some of these tests were made where the carbon had been destroyed and in others where the carbons remained perfected. We had suspected that there might be a chemical union at high incandescence between carbon and nitrogen, and Mr. Meyers, who was a good practical chemist, a graduate under Prof. Morton, of the Stevens Polytechnic institute, made these tests at our request, but was never able to find any evidence of such combination.

2 Q. State if you please, whether you opened any other sealed incandescent lamps in which carbon was the illuminating conductor, and if so, please state whether they are operated at high incandescence, what gases they were filled with, how many there were, how long they operated, and whether any of them exploded during their preparation or operation, and state whether you used or attempted to use anything but carbon as the illuminating conductor in your lamps.

Same objection.

A. I made and used a large number of incandescent lamps from the commencement of our operations up to February or March, 1879. All of them with carbon burners or incandescent conductors, and with nothing but carbon—never attempted to use anything else. They were all run for considerable periods, more or less, some for minutes, some for hours, some for days, some for weeks, some for months. The only gases we used, or attempted to use, were carbonic acid gas, ordinary illuminating gas, purified illuminating gas, hydrocarbon crude nitrogen gas, and pure nitrogen gas—or as nearly pure as we could get it. In most of these lamps the pressure was ordinary atmospheric pressure, in some highly rarified gases were used. We never burst the globe or glass of any lamp but one, that was filled with hydrocarbon or illuminating gas not sealed up tight, left over night and the air united with
3030 the gas, and the instant the current was turned, before any time to heat the gas, or cause it to expand, the globe, which was a Florence flask, was blown into innumerable pieces by the explosion that occurred. A large number of these lamps were made

of Florence flasks and filled with ordinary illuminating gas. They were run for hours at a time, day after day, thoroughly heated up, but never exploded or burst. We were in the habit, for fear they might not be properly sealed so as to exclude the air, which in union with the gas would cause explosion, of running the gas through every morning for a considerable time and freshly sealed them up. They were successful lamps, except for the fact of the deposit of carbon upon the illuminating part and *open* the interior of the glass. We would have to take them down every few days and clean them out and put in new carbons sometimes, because the carbon would grow too big to be rendered incandescent by the current used.

Counsel for Edison gives notice that he will move at the hearing to exclude this testimony of Mr. Man, upon the ground that it is not proper rebutting testimony, and upon the further ground it has no relation upon the subject in controversy, and declines to cross-examine.

ALBON MAN.

Sworn to and subscribed before me, this 23d day of September, 1881.

WM. H. BROADNAX,
Notary Public, Kings Co., N. Y.

Certificate filed in N. Y. Co., N. Y.

3031 Further taking of testimony pos-poned by consent to a day to be determined upon at a future time by the counsel.

CITY AND COUNTY AND STATE OF NEW YORK, *ss:*

I, William H. Broadnax, a notary public within and for the county of Kings (and having my certificate filed in New York county), and State of New York, do hereby certify that the foregoing deposition of Albon Man, William H. Church, William Sawyer, Amos Broadnax, Lawrence Myers, William E. Sawyer and George W. Sawyer, were taken on behalf of William E. Sawyer and Albon Man, in pursuance of notice hereunto annexed, before me, at 57 Broadway, in the city and county and State of New York, on the 14th, 15th, 16th, 17th days of March, and the 12th and 13th days of April, 1881, and on the 22d and 23d days of September, 1881; that each of said witnesses was by me duly sworn before the commencement of this testimony; that the testimony of each of said witnesses was written out by J. Edgar Bull in my presence; that Messrs. Dyer and Wilber, representing the opposing party Thomas A. Edison, were present during the taking of said testimony; that said testimony was taken at 57 Broadway in the city of New York, and was commenced at two o'clock p. m., on the 14th of March and was continued pursuant to adjournment on the 15th, 16th and 17th days of said month and the 12th day of April, 1881, and the 23d day of September, and was concluded on the 23d day of the month last mentioned; that I am not connected by blood or marriage with either of said parties, nor interested directly or indirectly in the matter in controversy.

[SEAL.] In testimony whereof I have hereto set my hand and affixed my seal of office, at 57 Broadway, in the said county, this 10th day of December, 1881.

WM. H. BROADNAX.

3032 In the United States Patent Office.

WILLIAM E. SAWYER and ALBON MAN
vs.
THOMAS A. EDISON.
} Electric Lighting.

Testimony on Behalf of Edison.

To Amos Broadnax, attorney for Sawyer and Man:

Please take notice, that on Friday, June 10, 1881, at eleven o'clock, a. m., at No. 65 Fifth avenue, New York city, I will proceed to take the testimony of T. A. Edison, Charles Batchelor, E. H. Johnson, John Kruesi, and others, in behalf of said Edison, and continue the examination from day to day until completed.

You are invited to be present and cross-examine.

DYER & WILBER,
For Edison.

Washington, D. C. Good service this 8th day of June, 1881.

AMOS BROADNAX,
Att'y for Sawyer and Man.

3033 In the United States Patent Office.

SAWYER AND MAN
vs.
THOMAS A. EDISON.
} Electric Lights.

Pursuant to notice hereto annexed, Mr. Z. F. Wilber appeared for Mr. Thomas A. Edison, at 11 o'clock a. m., this 10th day of June, 1881, at No. 65 Fifth avenue, New York city, and at the request by telegram of the attorney for Sawyer and Man, I have postponed the taking of testimony until 11 o'clock a. m., June 11th, at same place.

WM. H. MEDOWCROFT,
Notary Public and Commissioner, New York County.

3034 NEW YORK, *June* 11*th*, 1881.

Pursuant to adjournment the counsel for the respective parties appeared before me at No. 65 Fifth avenue, New York city, at 11 o'clock a. m., George W. Dyer appearing as counsel for Thomas A. Edison, and Amos Broadnax as counsel for Sawyer and Man.

By consent, the questions and answers were reduced to writing by H. W. Seely, he having first been duly sworn to faithfully and truly record the same.

THOMAS A. EDISON, a witness produced in his own behalf, being duly sworn, testified as follows in answer to questions proposed to him by GEORGE W. DYER, counsel for Edison:

1 Q. Please state your age, and residence, and occupation.

A. Age, 34; occupation, inventor; residence, Menlo Park, N. J.; for the time being living in New York city.

2 Q. Please relate in detail your earliest experiments in the carbonization of paper.

Question objected to, unless the experiments were made, or to be used, or with a view of using the paper in electric lighting, and unless the intention was to make the paper in burners for electric lamps.

A. I carbonized paper in the summer of 1876. Such paper was to be used for battery carbons, for non-conductors of heat, and articles were to be made in different shapes and carbonized. A great many articles were so made and carbonized from paper. Sheets of carbonized paper were used for electrical resistance about that time. Strips of card-board or bristol-board, about a quarter of an inch wide and five inches long, were placed in gas tubes and carbonized by placing the same in a furnace and heating the tube to a white heat. The strips were packed in the tube, one upon the
3035 other, and the interstices filled with charcoal powder. Sheets of tissue paper were laid in iron boxes, fifty to a hundred deep, on the top of which was laid a weight of metal so that the carbons would remain straight after being carbonized. Also sheets of thick bristol-board several inches square were carbonized under strain to keep them straight. Some experiments were also made to carbonize small crucibles made out of bristol-board.

Counsel for Sawyer and Man objects to the answer as going to show that the invention was made before the date named in the preliminary statement, in so far as it bears on the making of the carbon electrode of paper for the electric lamp.

3. Q. How extensive were these experiments, and what persons, if any, had knowledge of them?

Same objection as to former question.

A. The experiments were quite extensive. My intention was to go into the business of making carbon wire for various purposes, electrical and chemical, for electric lighting and batteries. A company called the American Novelty Company was to handle the goods in connection with a gentleman named James, who is now dead. Mr. Charles Batchelor, and, I believe, Mr. E. H. Johnson, saw many of the experiments. Mr. Adams, one of my assistants, now dead, helped me in the experiments. I would mention that we also carbonized wood made up in various shapes, as well as paper.

4 Q. What was the quality of the paper carbon produced at that time in the way you have described?

Question objected to on the same ground as before.

A. They were very fair carbons after we had got the idea of carbonizing them under strain and pressure.

3036 5 Q. Did you, at any time, determine the quality of these paper-carbon strips as to electrical resistance?

Question objected to on the same ground as before.

A. Yes; we placed them in electrical circuits and worked sounders through them. We also placed one of the crucibles in circuit, and boiled water by the heat engendered by the passage of the current.

6 Q. Did you test the electrical resistance of this carbonized paper as compared with various metals?

Objected to as impertinent.

A. Yes, sir; we did, as one of the uses of the paper was to make rheostats, and we concluded that the carbon would be suitable for rheostats. The resistances of the various strips were not wide apart from each other. The resistance as compared to metal was very much higher.

7 Q. Please state in detail your next experiments with carbonized paper, and when such experiments were made.

A. My next experiment with carbonized paper was the use of the same in a telephone, about May or June, 1877. We made telephones in which a great number of sheets of carbonized paper and bristol-board paper were placed between the electrodes in a telephonic circuit, and were agitated by the movements of a diaphragm for the purpose of transmitting articulate speech. In fact, in 1877, we tried every conceivable form of carbon in telephones. About August or September, 1877, strips of carbonized paper were placed *in vacuo* and brought up to incandescence. Many experiments were tried upon the incandescence of boron, silicon and carbon, in air and vacuo, about that time. My impression is that two gentlemen, Doctor Cordelius Herz, now in Paris, and Stephen D. Field, were witnesses to some of these experiments, whether boron, silicon or carbon experiments I cannot say. Also Mr. Charles Batchelor, Adams, who is dead, and others whom I cannot remember, saw these experiments. I think Herz and Field saw these experiments in September of 1877. 3037

8 Q. Please explain as fully as you can how these last-named experiments, in 1877, were conducted.

A. Two rods of brass, sliding in bearings forming the two poles of the battery, had upon their ends small clamps in which different substances could be clamped. In these clamps strips of carbonized paper were placed, about an eighth of an inch wide and two inches long. The paper used for carbonizing was bristol-board. The carbon was brought up to incandescence, but quickly oxidized and was destroyed as it was in the open air. Attempts were made to coat the carbon with powdered glass, so it would melt and run over the carbon and thus preserve it. This did not work. Then experiments were tried on pieces of silicon, which the books stated did not oxid-ze when in incandescence in the open air. Also upon boron; but these did not succeed well, as they were in very small pieces, and we could not make good contact at the electrodes. Afterwards we tried the experiment *in vacuo* with a common air pump, but the vacuum that we were able to get was so poor that the carbon oxidized almost as rapidly as it did in the air.

9 Q. Have you any sketch of the construction used for holding the carbonized-paper conductor mentioned in your previous answer? If so, produce it. If you have not such sketch, please make one now, to be attached as an exhibit in this case.

A. I think I have the original apparatus which I believe I can produce, and will do so if possible.

10 Q. In this apparatus referred to, was the carbonized paper strip an incandescent conductor suitable for use in an electric lamp?

Question objected to, unless the strip was afterwards used in an electric lamp, or intended for one at the time.

3038 A. It was used as an incandescent conductor in an electric lamp, but not under proper conditions.

11 Q. When was this experiment made?

A. I think about September, 1877.

12 Q. Why did you not refer to these experiments in your preliminary statement filed in this interference?

Objected to as incompetent, irrelevant and immaterial.

A. The experiments had, I think, slipped my memory when I made out the preliminary statement.

13 Q. Please state in detail your next experiments in this connection.

A. The next experiments took place, I think, in October or November, 1878. My assistant, Mr. Batchelor, made a great number of paper carbons, fifty or upwards, which consisted of tissue paper, and other kinds of paper, coated over their surface with a mixture of lamp-black and tar, and then rolled up in the form represented by a knitting needle, and afterwards carbonized by heat. These were included in electrical circuits and brought up to incandescence *in vacuo*. They were also used in a lamp devised about the same time, which lamp is shown in my patent 224,329, where the light was given by the incandescence of the carbon at the point of contact between the electrodes. The carbon did not last very well *in vacuo*, and we found it very difficult to clamp it so as to prevent the large current used from producing an arc at the point of contact, but in a form of lamp similar to that shown in patent 224,329, they gave better results.

14 Q. What degree of use was made of the electric lamp last described?

A. We burnt them for several hours at a time, but the best results were obtained with wood carbons.

15 Q. Are any of those lamps now in existence?

A. I do not think so. I think there were one or two made and then used for other purposes.

3040 16 Q. Does the drawing of the patent you have just referred to show fairly the construction of the lamp which was made and used at the time named?

A. It does; but we made other forms not shown in the patent. I have represented these in a sketch which I now produce, marked "Edison Exhibit 1."

(Here follows diagram marked p. 3039.)

In this exhibit Fig. 1 represents a spring *a*, secured to a pillar B. Upon the extremity of the spring is a clamp *c*, for securing the carbon. The lower extremity of the carbon rested upon iridium-pointed prongs *e*, *d*, *f*, at the point *x*, the tension of the spring acting to press the carbon slightly against the iridium points. Sometimes the current was passed through the wire *g*, through *a*, thence through the carbon to the points, and out by the wire *l*, which connected to all three points. At other times the current was passed through the wire *h*, thence through the point *d*, across a portion of the carbon, thence to the point *e*, and wire *k*. This latter method is shown better in Fig. 4. In this figure the spring *a* is dispensed with, and a weight, *c*, is used to press the carbon against the two iridium-pointed electrodes *e*, *d*. The current passing from *d* to *e*, through a portion of the carbon, caused it to become incandescent, and as fast as the carbon wore away by oxidation it was fed down by the action of the weight or even by the weight of the carbon itself. In Fig. 2 the current passed through the point *h*, across the carbon strip, thence down through the point *k*, rendering that portion of the carbon between the two electrodes incandescent. The contact between the two points was brought about by the weight of the carbon paper. The whole apparatus was placed at an angle. In Fig. 2½ is shown about the angle at which the paper was placed, *x* being a limiting stop for the downward passage of the carbon. It was so arranged that if the points *h* and *k* were taken away the paper would fall between the support *g* and limiting stop *x*. Fig. 3 shows a modification of the apparatus in Fig. 1, a mercury cup being placed on the top of the carbon, in which a platina
3041 wire was in contact with the mercury, *a* being the mercury cup, *g* being the platina wire. In the patent No. 224,329 a ball of iridium was used upon the upright metallic portion of the electrode, upon which the contact between carbon and the iridium took place, as seen in Fig. 2 of the drawing of the above-mentioned patent.

17 Q. In the instances named of patent 224,329, and shown in your Exhibit No. 1, were the conductors of carbonized paper?

A. Yes, sir; a great many of them were carbonized paper—a few were made out of wood.

18 Q. In all the above-named instances was provision made to keep the electric continuity intact, and prevent the formation of an electric spark?

A. Provision was always made for the passage of a continuous fig 1

current, the light given was partially due to an arc and partially to electrical incandescence.

19 Q. Can you give any instances of electric lamps of other inventors operating in substantially the same way?

Question objected to as incompetent, impertinent and irrelevant.

A. I believe the Wendermann lamp operated in the same manner, also the Joel lamp, now operating in London; and I also believe Mr. Sawyer's late lamps act somewhat on that principle.

20 Q. Are these experiments just described as having been made in October or November, 1878, referred to in your preliminary statement?

Question objected to as incompetent.

A. Yes, sir; these and other experiments made about the same time.

21 Q. Please relate fully the other experiments referred to in your previous answer.

A. We, in November or December, 1878, had our vacuum pump placed in order to conduct some experiments on incandescent
3042 carbon conductors *in vacuo*, and we tried a great number of experiments with paper carbons, wood carbons, and carbons made with carbonized broom-corn. What we desired at that date, and had concluded as the only possible solution of the subdivision of the electric light, was that the lamps must have a high resistance and small radiating surface, so as to be capable of being worked in multiple arc commercially, and our calculations showed us that the lamp must have at least 100 ohms resistance to compete successfully with gas; otherwise, if the lamps were of low resistance, the cost of the main conductors would be so great as to render the system uncommercial. What is meant here by a subdivision of the electric light is that many thousand lamps could all be placed upon a single circuit and be entirely independent of each other. We, from our previous experiments, knew that we could get the requisite resistance and small radiating surface necessary for a commercial use of the light, by means of carbonized paper or wood; and, therefore, while working to accomplish this end by means of platinum, we endeavored, by a more perfect vacuum, to obtain incandescent conductors of carbon which would give us the result. But our experiments in November, as before mentioned, with a good pump, wherein we used paper and wood carbons, were not so satisfactory as the experiments we were conducting with platinum conductors. When we made the carbon in such a form as to have a small mass and high resistance to suit our purposes, it would last but several minutes. We then laid these experiments aside, and went on with platinum, to endeavor to obtain a lamp of high resistance and small radiating surface. The results of our experiments are shown in patents No. 227,228, 227,227, 227,229. The great point we desired was a lamp of high resistance and small radiating surface, and it did not matter very much whether it was of carbon or of platinum. The necessity of these features, and the necessity of the single-lamp

multiple-arc system is more particularly set forth in a British
3043 patent No. 2402, dated the 17th of June, 1879, in lines 12 to 37 inclusive, 3d page. Also from line 98, page 1, to line 27, page 2, of U.S. patent 227,229. Also in U.S. patent 223,898. Nearly the whole of this patent gives information on the subject. Returning to the experiments mentioned at the beginning of this answer on incandescent paper and other carbons, we found our endeavors blocked in the matter of obtaining incandescent conductors of high resistance and small radiating surface, by the fact that we could not make them last for any length of time in the best vacuum obtainable with our air pump, which was considered a good one. But when in the course of our attempts to attain the same object by means of incandescent platinum, we had procured a Sprengel mercury pump and ascertained that we could get exceedingly high vacuum, it occurred to me that, perhaps, a filament of carbon could be made to stand in the sealed glass vessels which we were using, exhausted to a high vacuum, and in October, 1879, we made lamps of paper carbon, and carbons of common sewing thread placed in a receiver made entirely of glass, with the wires sealed therein by fusion, and the whole exhausted by a Sprengle mercury pump to nearly the one-millionth of an atmosphere and these filaments of carbon, although excessively fragile, owing to their small mass, had a smaller radiating surface and higher resistance than we had hoped; we had reached the conditions where, notwithstanding the carbons were small in mass and filamentary, they were stable. Sufficiently so to allow of the economical subdivision of the electric light and the possibilities of competing commercially with lighting by gas. It was the new conditions which caused this lamp to be a success, which conditions were high vacuum in a receptacle in which no deterioration or lowering of the vacuum occurred to destroy the carbon. These experiments resulted in the lamp and various modifications and forms more particularly set forth in my patent 223,898, and in the application now in interference.

3044 22 Q. Please state what you were doing in the way of experiments upon this subject between November or December, 1878, and October, 1879.

A. I was endeavoring to obtain a lamp of high resistance, for instance, a hundred ohms, with small radiating surface, the former to permit of economical subdivision, and the latter to permit of economy in the use of electric power, and I used platinum and platinum-iridium wire during that time to attain this result, all of which are more particularly set forth in the patents which I have heretofore recited; in conducting those experiments we made a great variety of platinum lamps in which a major portion of the wire was so coiled as to not radiate light, to the end that the lamp might have a high resistance; one of these forms is shown in my patent 227,229.

23 Q. At what date did you begin to make glass bulbs or shells especially adapted and used for electric incandescent lamps?

A. I think separate lamps, independent of the air pump, were made either in December, 1878, or January, 1879, except the device used in 1877, which was capable of being detached from the pump and placed in any position, but my impression is that the first vacuum bulb for an incandescent conductor that would hold its vacuum, was made in June or July, 1879; this was made entirely of glass, with the conducting wires sealed therein and the vacuum obtained with a Sprengel pump; a platinum conductor was used with these lamps; it might have been as late as August, 1879; I will look over some of my memoranda to-night and refresh my memory on that point.

24 Q. When did you produce electric lamps with incandescent paper-carbon conductors in vacuum bulbs, hermetically closed, so as to be a commercially complete lamp, capable of entering into competition with gas lights?

A. I made such a lamp about October 22d, 1879, which 3045 had the characteristics of high resistance, small radiating surface, and sufficient stability and economy to allow of competition with gas.

25 Q. What was the extent of your manufacture and use of such lamps thereafter?

A. We commenced immediately to make a number of vacuum pumps and started to manufacture these lamps of paper carbon, with the pump we had on hand; during November we made a great number of lamps of this character, perhaps as many as one hundred; these were put up in the laboratory at Menlo Park, and various experiments tried with them, among which was a test of their candle power, economy, resistance, lasting time at various degrees of incandescence; in the latter end of November, 1879, we commenced operations with a view to get our dynamo machines, regulators and wires in order to make a public exhibition of these lights. What I mean by a public exhibition is a more general exhibition, as everything that I did in my laboratory for the last three or four years was seen by thousands of persons from all parts of the world.

A great many persons visited the laboratory to see the lights in operation in December, 1879, caused by an intimation in one of the daily papers that my electric lights were burning. But on December 21st, 1879, the New York Herald published an account of my experiments, a copy of which article is now furnished, marked Edison's Exhibit No. 2.

(Here follows sheet of New York Herald, marked p. 3046.)

On December 25, 1879, I had lighted up my laboratory, my office and two or three houses, situated about a fifth of a mile from the laboratory, and also about twenty street lights. On New Year's eve, 1879, about 3,000 people visited Menlo Park, and thereafter to the present time all my experiments have been public. I have made probably 3,000 lamps containing the paper-carbon conductor, now in interference.

Some time in the spring of 1880, I lighted up the steamship "Columbia" of the Oregon Steam Navigation Company, with about seventy-five to a hundred lamps containing paper carbons 3047 which continued to light the ship satisfactorily for several months. Exhibitions of the same were made on the steamship "Columbia" at Rio Janeiro, Brazil, Valparaiso, Chili, San Francisco, California, and Portland, Oregon. I understand some of the lamps were lighted during the voyage around Cape Horn, and were kept lighted from San Francisco to Portland on the regular trips for several months, and I have recently shipped several hundred lamps to replace the ones broken. Since that time I have tried an enormous number of experiments to cheapen the cost of my lamps, to increase their length of life, and economy and resistance. The nuclei for manufacturing the lamps, established at Menlo Park in November and December, 1879, have been expanded into two large factories, one situated at Menlo Park and the other at East Newark, N. J. The factory at Menlo Park employs about one hundred hands, turns out about one thousand lamps a day, and has manufactured about sixty thousand lamps. The factory at East Newark is being arranged to manufacture fifty thousand lamps per day.

26 Q. Returning now to the paper-carbon incandescent lamps made by you in the winter of 1879–'80, what actual use were they subjected to, and what was the extent of their durability as lights; also what was the quantity of light produced by each lamp according to gas standards?

Objected to as incompetent, irrelevant and immaterial.

A. Each lamp gave about 12 to 16 candles of light. They were put up on chandeliers and run until they were destroyed. Some of them were run all day and night and others by night. A record was kept of the hours each one ran, which record I have here. The lamps are numbered from 142 to 417. Examining this record to refresh my recollection, I am able to state that, for 3048 instance, lamp 142 lasted 404 hours; lamp 159 lasted 480 hours; lamp 189 lasted 217 hours; lamp 255 lasted 294 hours; lamp 223, 262 hours; lamp 167, 15 hours; lamp 204, 16 hours; 203, 17½ hours; lamp 155, 280 hours; 201, 280 hours; 164, 322 hours; 172, 259 hours. Looking over the whole record, I should judge the average life was about 300 hours. I remember two lamps, one of which lasted 1,350 hours, and another one 940 hours, cut from the same mold and of the same size and same paper as the lamps I have mentioned by numbers. The numbers I have given occur on the pages of the book consecutively.

By agreement of counsel, here made, the book of record referred to in the above answer is tendered to counsel for Sawyer and Man for use in cross-examination, and copies of so much of the record as has been testified about by the witness, being pages 1 to 15 inclusive, are attached as exhibits and marked Edison's Exhibit No. 3.

The taking of further testimony was adjourned until Monday, June 13, 1881, at 10 o'clock a. m., by consent, at the same place.

WM. H. MEADOWCROFT,
Notary Public, New York County.

3049 Pursuant to adjournment, this examination was resumed June 13, 1881, at 10 a. m., at No. 65 Fifth avenue, same counsel being present.

The witness, THOMAS A. EDISON, further answers to questions proposed by GEORGE W. DYER, as follows:

27 Q. Since testifying on Saturday, have you made examination among your papers and exhibits at Menlo Park with reference to your early experiments in electric lights in which carbonized paper was used as a conductor? If so, produce what you have found and explain the same.

A. I have made such an examination. I produce an electric lamp in which experiments were made with a paper carbon brought up to incandescence *in vacuo*. This lamp was used about September or October, 1877. The apparatus originally was one for illustrating Geissler tube action *in vacua*. The base of the apparatus fitted over the hole in the platen of the air pump. It was then exhausted and the cock turned to preserve the vacuum of the globe of this lamp. We did not succeed in getting a higher vacuum than 2½ millimeters on the mercury gauge, and we could not make the carbons burn more than a few minutes at a time. Some of the carbons were brought up to brilliant incandescence and probably gave thirty or forty candles of light. The carbons were brought up to various degrees of incandescence. The carbons were made of sheet paper of various widths and thickness. I think they were made of bristol-board. They were from three-sixteenths to a sixteenth wide, and probably from eight to fifteen thousandt-s thick. I believe they were carbonized in tubes made of gas pipe. I cannot remember whether they were prepared at the time or were on hand; we had an immense collection of carbonized paper and wood on hand, which we used in our telephonic experiments in 1877.

3051 The lamp referred to in the above answer is put in evidence, and is marked "Edison's Exhibit First Incandescent Lamp."

Counsel for Sawyer and Man object to the exhibit upon the ground that it goes to show and is intended to show, that the invention was made previous to the date alleged in the preliminary statement of Mr. Edison, in this interference, and he objects to all that part of the answer that is intended to show, or goes to prove, that the invention was made previous to the time alleged in such preliminary statement, and gives notice that upon the hearing of this interference, he will move to strike out the exhibit, and all that part of the answer objected to.

28 Q. Can you explain now why you did not refer to this exhibit in your preliminary statement?

Objected to as incompetent, immaterial and irrelevant. Notice of motion to strike out at the hearing.

A. I had forgotten about the experiments. I had forgotten that I had the exhibit, and it only came to my recollection Saturday in conversation with my assistant, Mr. Batchelor. The results were probably not sufficiently satisfactory to impress it upon my mind. I try so many thousand experiments in all branches of physics that I sometimes forget some of them. The preliminary statement was made at a time when I was under great strain, and crowded with people at my laboratory.

Answer objected to upon the same ground stated in the objection to the question. Notice of motion to strike out at the hearing.

3052 29 Q. If you have any other exhibits found by you at Menlo Park on your late search, please produce such with full explanations.

Question objected to upon the ground that it is incompetent, unless it is intended to call out evidence to show that the invention was made subsequent to the date stated in the preliminary statement.

A. I present an exhibit which serves to refresh my memory regarding the experiments tried on electric light in 1877. The exhibit is dated November 1st, 1877, witnessed by Charles Batchelor, myself and John Kruesi, and I know the signatures to be their handwriting. In this exhibit is shown lamps giving light by the incandescence of boron, silicon and other substances included in the electric circuit, such lamps being arranged in series and in multiple arc. The experiments with carbonized paper in vacuum were made previous to the date of the exhibit of November 1st, 1887.

Answer objected to as intended to show that the invention in controversy was made previous to the date given in the preliminary statement of Mr. Edison.

Notice of motion to strike it out at the hearing.

Paper referred to put in evidence and marked Edison's Exhibit No. 4.

(Here follows diagram marked p. 3050.)

Exhibit objected to on the grounds stated in last objection, and notice of motion to strike out repeated.

I now produce another paper, dated December 3d, 1877, which serves, like Exhibit No. 4, to refresh my memory regarding experiments with the paper carbon. This paper is witnessed by myself, Charles Batchelor and John Kreusi, and I know the signatures to be their handwriting. It refreshes my memory as to the fact
3054 that we were trying to subdivide the electric light into a
small number of burners, where the circuit was closed by solid conductors, and the reasons why experiments were conducted with boron and silicon was because they were not subject to oxidation like carbon, which we had previously tried, and which did not last as long at a white incandescence as pieces of graphitoidal silicon, forming part of the electric circuit, and rendered incandescent by the passage of the current. The results of the carbon experiments, and also of the boron and silicon experiments, were not

considered sufficiently satisfactory, when looked at in the commercial sense, to continue them at that time, and they were laid aside.

The paper referred — in the above answer put in testimony and marked "Edison's Exhibit No. 5."

(Here follows lithograph marked p. 3053.)

Paper exhibit objected to as impertinent and irrelevant, and as intended to show that the invention was made previous to the date mentioned in the preliminary statement.

Notice of motion to strike it out at the hearing.

30 Q. Please state whether or not the paper-, Exhibits No. 4 and No. 5, were written at the dates given upon each of them.

A. Yes, sir; they were.

31 Q. State whether or not your memory is distinct as to the fact that the experiments with boron and silicon, mentioned in these exhibits, were made after your experiments with carbonized-paper conductors, and after the employment of such conductors in the lamp marked "Edison's Exhibit First Incandescen*e* Lamp."

Same objection as before, and same motion.

A. I am certain it was before, because we used boron to get rid of oxidation, to which the carbon was very sensitive.

3055 32 Q. If you have any other exhibits relative to the matter in question, found in your late search at Menlo, please produce the same with explanations?

A. I present a lamp, which is one of my well-known carbon horseshoe lamps, made, I think, some time in December, 1879, and is of the same kind and character as those made in October, 1879. This lamp is illustrated in the New York Herald of December 21st, 1879, heretofore put in evidence.

33 Q. State, if you please, in that connection, whether or not this lamp was actually put in circuit, when and where burned, stating the length of time and the amount of light given by it.

A. I find that its number is 235, and on referring to my note book, I find that the lamp either burnt seventy hours and eighteen minutes or 250 hours and forty minutes, as the record is obscure. It gave a light of probably from twelve to sixteen candles. It is one among a hundred that were burning at the same time. One lamp which I had previously mentioned, made in the same way and in the same manner of carbonized paper, lasted over 1,300 hours, and I believe that the lamps of this character, made in the regular way, had an average life of about 300 hours, which was sufficient to render them a commercial success in competing with lighting by gas. Had they but lasted an hour, or if the average life of a great number of these lamps were only a few hours, they would not have been a commercial success, and the results would have been of no benefit to the public.

But these lamps, in addition to the fact that they lasted for a long time, had other characteristics, without which, even with a long life, they would not have been available for competing with gas. These important characteristics were that they were of high resistance of small radiating surface, and hence economical, for the reason that smaller conducting wires could be used for conveying the current, as owing to the high resistance of the lamps, 3056 weak currents were only necessary, and sufficient energy to produce the result was forced through the wire and lamps by increasing the electric pressure or electro-motive force. If lamps of low resistance were placed in multiple arc in a single circuit the aggregate resistance of all the lamps would be very low, and conductors of correspondingly large dimensions would have to be used, otherwise a great loss of current in the form of heat would take place on the conductor. Hence, if the resistance of each lamp was made, say 100 times greater, then the conductors could have a hundred times less area, and the losses would be the same in both cases. With small radiating surface less energy is required to produce a candle power than on a larger surface. Again, economy is attained from the fact that these filaments of carbon, being small in mass, do not conduct heat any better than they do electricity, and therefore very little heat is conducted from the glowing incandescent conductor to the clamps and supports for the same. Hence no special appliances are essential to get rid of the heat of conduction, as are employed in the type of lamps experimented upon by Mr. Sawyer. Again, high *vacua* render the carbon horseshoe practically stable and at the same time result in great economy in the use of electricity, as practically all the energy is lost by radiation, and none by conduction. My experiments have shown that if the carbon horseshoe is placed in an atmosphere of nitrogen at the atmospheric pressure, which is the method adopted by Mr. Sawyer in his lamp experiments, it requires nearly twice as much electricity to bring the horseshoe up to the same candle power as it does when the horseshoe is in high vacuum. As in the former case, heat is lost by conduction through the gas, which serves to carry it to the inclosing globe, from which it radiates invisibly. Hence this lamp is, I believe, the first one ever produced that was commercially available for competition with lighting by gas, and of great public utility.

This lamp, No. 235, was made at my own laboratory at 3057 Menlo Park some time in December, 1879, was put up in a street lamp at the top of the stairs in front of the depot at Menlo Park, a fifth of a mile from the laboratory, and there burned until destroyed. I think it was made a few days before it was put up. According to its record I find it had burned forty hours previous to January 3d, 1880. It was seen along with about a hundred others like it, by at least twenty-five thousand people, in December and January. At least that is my impression.

All that part of the answer after the ninth line (fourth printed line) is objected to as irresponsive, and a mere lecture on the best proportion for making a lamp and burner, in Mr. Edison's opinion.

The lamp referred to in the previous answer is put in evidence and marked "Edison's Commercial Incandescent Electric Lamp."

34 Q. Please point out the peculiarities of construction which make this lamp of practical value as compared with other incandescent lamps, and particularly those produced in accordance with the inventions of Sawyer and Man.

A. I have already stated that in my previous answer, to which I refer as an answer to this question.

35 Q. Please state whether or not this exhibit is one of the class of lamps of which you have testified previously that about 3,000 were made, and if there were any differences in construction in any of the 3,000 lamps, please state what such differences were.

A. They were the same, except, perhaps, in the shape of the clamps for holding the carbon and in the form and method of clamping the paper horseshoe carbon to the wires that pass through and were sealed into the glass.

3058 36 Q. Calling your attention to this exhibit, please describe fully the bulb or globe, stating when and where it was made and by whom, and the advantages connected with its form and size.

A. The lamp was made some time in December, 1879. I think by a person named Boehm, who was employed as a glass-blower at my laboratory at Menlo Park. The great advantage of this form and kind of inclosing chamber is that, unlike all previous attempts made for lighting by the incandescence of carbon, the incandescent conductor is placed in a chamber made entirely of glass the wires forming the leading-in conductors passed from the exterior to the interior of the chamber, and sealed by fusion of the glass where they pass through it. Hence these glass chambers when exhausted to high vacuum preserved the exhaustion constant, and thus provide the all-essential condition for high economy and length of life of the thin filament of carbon which it is essential to use to attain high resistance, to permit of the economical subdivision of the electric light. All attempts, I believe, heretofore have failed to preserve the vacuum, where a vacuum is used, and thus preserve the carbon, for the reason that the chamber was not composed entirely of glass, but of glass and metals and materials, between the glass and which there was a difference in coefficient of expansion, which at times admitted the air; hence most inventors have used a supposably inert gas in the chamber, at atmospheric pressure, and the leading-in wires have not been passed through the glass and fused therein, which is an essential feature. The form and size of this lamp are very convenient, as it is small, light, portable, durable, and admits of radiating the light in all directions, so that practically none is lost. Its size is such that it contains very little air, hence is quickly and economically exhausted of the same in the process of manufacture, and the whole lamp is so light as to be used on chandeliers now used for gas, in great numbers.

3059 37 Q. Referring to the same lamp, please describe the leading-in wires and the incandescent conductor, and state the advantages connected with the form and size of the same.

Objected to as immaterial, impertinent and not bearing upon any issue in controversy.

A. The leading-in wires to within a quarter of an inch of the glass are formed of copper. To these copper wires are secured, by soldering, platinum wires, which pass through and are fused in the glass. Upon the extremity of these wires within the chamber are clamps, which serve to clamp the broadened ends of the filament of carbonized paper. This broadened end is essential to permit of a proper clamping and electrical contact, as the increased conductivity of the broadened end to the electric current prevents it from becoming incandescent. Hence, little arcs and bad contacts at the point of clamping, which would tend to destroy the lamp do not take place. If the filament of carbon was the same size all over, so that the portion clamped was no larger than the portion which was incandescent, the lamps of this character would be rapidly destroyed by the formation of small arcs at the point of clamping, which throwing out the vapor of carbon and platinum within the vacuum would permit of the formation of a large arc between the two leading-in wires, and the lamp would be instantly destroyed. The paper horseshoe being of small radia-ing surface and small in mass, is very flexible, and after the passage of the electric current very tough. Hence the lamps may be handled, practically, with impunity as far as breaking the carbon horseshoe is concerned. In fact, after the current has passed through the horseshoe the two broadened ends may be taken in the fingers and pulled out nearly straight without breaking. The advantages of the horseshoe shape are, that it permits of the expansion and contraction of the carbon freely without injuring it, and also permits of nearly all the light being utilized—in fact nearly the maximum amount. The necessity of using
3060 platinum to seal in glass is, that of all metals its coefficient
of expansion is nearest glass, and hence the glass and platinum will expand and contract together under differences of temperature and thus prevent leakage of air or cracking of the glass chamber.

Same objection to answer as to question.

38 Q. Please state how the carbon conductor in this lamp and those like it was made, and where?

A. The carbon conductor was made at my laboratory at Menlo Park, either in October, November, or December, 1879, in the manner and of the material described in my application, now in interference.

39 Q. Please state how you exhausted the air from this lamp and others made like it?

A. We exhausted the air by means of a double glass pump—one part of the pump being known as a Geissler pump, and the other as a Sprengle pump, in which mercury was used in the well-known manner. The apparatus is shown on page 99 of my Note Book No. 85 (a copy of which sketch is produced and put in evidence and marked Edison's Exhibit No. 6).

S. D. Mott

Exhibit objected to as being secondary evidence, being an alleged copy and not the original referred to by the witness, and the copy not being produced.

Counsel for Edison states that the sketch referred to is one of the pages of a very valuable book of original records, which book is now tendered to the counsel for Sawyer and Man, for inspection, and that a tracing copy will be furnished as soon as it can be made and before the examination of this witness is closed.

40 Q. To what extent was exhaustion produced by the apparatus described?

A. I think the exhaustions were carried beyond the mil-
3062 lionth of an atmosphere. We had on this apparatus a Mc-
Leod g*ua*ge to measure the degree of exhaustion. In the notes which accompany this sketch it is stated that a vacuum was obtained where the jump spark from an induction coil jumped five (5) inches in air rather than pass across between electrodes a quarter (¼) of an inch apart in vacuum. This denotes exceedingly high vacua, exceeding the millionth of an atmosphere.

41 Q. When was the sketch referred to made?

A. It is dated October 2d, 1879, and witnessed by S. D Mott, and myself. The drawing was made by Mr. Mott, and it was, I think, made on the day of date. The notes are in the handwriting of Mr. Upton, I think the notes were made about the same time.

42 Q. Please read from these notes whatever refers to the construction and mode of operation of the vacuum apparatus shown in the sketch?

A. I will furnish a copy of the notes referred to taken from the book, which copy will be marked Edison's Exhibit No. 7.

Mr. Broadnax objects to the notes, because it appears that they were not made by the witness himself or in his presence.

43 Q. Whose property is this book, and under whose direction and by whom were the entries made in it?

A. The book belongs to myself. It is one of about two hundred or more books in which my experiments in electric lighting are recorded. The entries relating to this exhibit were made by Francis Upton, my assistant, under a general direction from me. The sketch itself was made by Mr. Mott, another one of my assistants.

44 Q. Please describe, briefly, the manner in which the apparatus
shown in the sketch referred to operates in exhausting air
3063 from lamps, and if necessary to make the sketch more clear,
put additional letters of reference on the parts.

A. The bottle at the top of the pump is the mercury reservoir, leading from which is a rubber tube through which the mercury passed up to the first glass tube on the left-hand side of the pump board. The mercury then passed into the air trap G, then around the bent tube to the contraction F, through a small tube within a bulb, thence dropping down the second tube on the right to D. These drops of mercury, in dropping acted as pistons, between which the air was confined, after the manner employed by Sprengel. E

X is the McLeod *guage* for measuring the degree of exhaustion. A bottle on the left lower corner, containing mercury, was connected to the McLeod *guage* by a rubber tube. When this bottle was lifted, the mercury passed up in the round bulb of the *guage* and forced what residual air there was up into a tube with a capillary base, and with a paper scale behind it. The two tubes on the right of the pump stand form the well-known Geissler pump. The mercury bottle at the lower end on the right was connected to the second glass tube on the right of the pump board by a flexible rubber tube. A stop-cock B being turned so that no mercury could enter the main vacuum apparatus, the bottle was lifted and the mercury ran into the chamber in the upper part of the tube, filled it, and forced what air there was in it over into and down the first tube on the right to the trap D, and thence to the atmosphere. The mercury bottle was then lowered and the mercury ran out of the chamber leaving a vacuous space. The cock B was then turned, so that the chamber formed part of the general vacuous space of the pump. The bulbs on the right-hand corner at the top were the lamps which were all sealed by fusion with each other, and then to a tube provided with a ground-glass stopper, fitting into the vacuum apparatus. A stop-cock on the right near the top served to
3064 disconnect the pump from the bulbs or lamps when they were
properly exhausted, so they could be sealed off and others put on without losing the vacuum in the pump entirely. The two bulbs on the top and above letters B and C contained phosphoric anhydride, to remove water vapor from the air, and gold leaf to absorb mercury vapors. Above these is the Geissler spark gauge, with the two electrodes. The major portion of the air was taken out by the Geissler pump, and the rest of the exhaustion was carried on by the Sprengel pump.

45 Q. In addition to means for making lamps completely like that shown in Exhibit Edison's Commercial Electric Lamp, and means for exhausting the air completely from such lamps, what else had you done in the latter part of 1879 towards a perfect operative system of electric lighting by incandescence?

A. I had been devising a complete system for the general distribution of electricity, so as to compete with gas. I had dynamo machines, a station regulator for keeping the pressure constant througout the system, meters for measuring the amount of current consumed by each customer, street mains for distributing the electricity, sockets for holding the lamps and chandelier appliances, electro-motors for utilizing electricity for power on the light wires, vacuum pumps and devices for the manufacture of electric lamps, carbonizing furnaces, and molds and appliances therefor, and in fact a complete system of electric lighting by incandescence, upon the plan of general distribution over large areas. About the middle of December the whole system was started and publicly exhibited to many thousand people. Several houses were lighted, besides my laboratory, and twenty street lamps were also lighted. What has been done since that date has been towards means and methods of manufacture, cheapening the processes of manufacture, and estab-

lishing factories. In the latter end of December, or in the early part of January, I accepted the proposition of Mr. Villard to
3065 light up the steamship Columbia. I immediately went to
work preparing to do so. The apparatus was finished and placed on board a few days after she came out of the ship yard, which was, I think, in May or June, 1880.

46 Q. What was the resistance of the lamps made by you in the latter part of 1879?

A. Some of them were as high as 1,000 ohms, but the average resistance of the paper carbon was about 100 ohms when hot.

47 Q. In your late search at Menlo, did you find paper or model exhibits of experiments for 1878, which you are now ready to offer?

A. I did not find any apparatus that I was sure was used in 1878 with the paper carbons; but I have a man searching for them. My practice is that when I make apparatus to try an experiment I keep making changes on this apparatus to try other experiments, many of which have nothing in common with the purpose for which the instrument was first devised. I conduct such a great number of experiments that I could not afford to keep the original apparatus if it was required to try another experiment, even with a matter entirely dissimilar as to its object.

Counsel for Edison gives notice that if at any time during the examination or cross-examination of his witness, any exhibits of experiments of 1878 are found, he will put the same in evidence.

48 Q. In all the instances of carbonization of paper given by you in this testimony, was there any other treatment of the paper besides simple carbonization?

A. In the lights made of paper horseshoes, of which there were about a hundred burning at a time, and which I have spoken of as being exhibited to the public, the paper carbons were not treated. Some lamps were made in December, 1879, to see what effect treatment would have, but only a few were made. In the experiments in 1877 with a paper carbon no treatment of the carbon with
3066 any other substance was made, except the incidental effect
of the grease used in the lamp being decomposed and depositing carbon on the incandescent conductor in the Exhibit First Incandescent Lamp. This was not the intentional treatment. The carbons made in 1878 were generally composed of paper having its surface treated with lamp-black and tar. I believe a few of the carbons made in 1878 were soaked after carbonization in tar, and recarbonized.

49 Q. I call your attention to the printed record of the testimony of A. Man, near the bottom of page 7, where he says "we use principally ordinary blotting paper." Have you had any experience in the carbonization of ordinary blotting paper, and if so, with what results?

A. Yes, sir. I have carbonized blotting paper. It makes a loose, non-coherent, friable carbon. Some kinds of blotting paper separate in carbonizing into two or three layers. When a current is passed through it, little arcs occur throughout the carbon, due to the loose contact of one fibre with another. I have made incandescent carbon conductors out of it, but they were not satisfactory.

50 Q. I further call your attention to another paragraph upon the same page of Mr. Man's testimony, at the bottom of the page, where he speaks of "rubbing down and working out by hand the carbon," and ask if you have ever had any experience in this kind of manipulation of paper carbon?

A. I do not conceive how it is possible to rub down a paper carbon made out of blotting paper, without it is very large, such as an eighth ($\frac{1}{8}$) of an inch square, and then I judge it would be exceedingly difficult. I never did this, nor did I ever see any one do it. If the carbon was anything like the flexible filament as shown in my commercial electric lamp, I should say it is impossible. Further, I do not see the necessity of it, as any thickness of paper could have been used, and any desired shape could have been obtained from the paper in the first instance. It is not an easy matter to rub down blotting paper before it is carbonized. 3067 & 3068

The taking of further testimony herein was adjourned by consent to Tuesday, June 14, 1881, at same place.

WM. H. MEADOWCROFT,
Notary Public, N. Y. Co.

Pursuant to adjournment this examination was resumed June 14, 1881, at 10 a. m., at No. 65 Fifth avenue, the same counsel being present.

The witness, THOMAS A. EDISON, further answers to questions proposed by GEORGE W. DYER, as follows:

51 Q. I call your attention further in testimony of Albon Man, answers to the 4th and 18th questions, and ask if paper carbonized electrically as described can afterwards be made incandescent?

A. I have tried many experiments on the carbonization of paper, both by the passage of the current through a filament with plumbago on its surface, and also by the passage of current through a platinum conductor on which the paper rested, and always found that the decomposition of the cellulose and water of the paper produced sufficient oxygen to consume all the carbon of the paper, and the result was that nothing was left but the natural ash. These experiments were conducted *in vacuo*. I do not see how it is possible to produce a carbon which could be used in a lamp by simple carbonization of the paper by the heat produced by the passage of the electric current in an atmosphere of nitrogen, hydrogen or air.

3069 52 Q. Referring to the 57th and 57½ questions and answers of Albon Man what would become of a Florence flask filled with gas as described and subjected to currents of electricity?

A. I have placed illuminating gas in flasks similar to a Florence flask and in which there was an incandescing conductor of carbon, and on heating the same to high incandescence, the globes exploded, due to the enormous expansion of the gas and decomposition of the same.

53 Q. Referring to answer Q. 61 in the testimony of Albon Man, what comment, if any, have you to make on the statement that the oxygen of the salts would consume the paper?

A. I do not see how any oxygen salt would cause an*d* paper to become a conductor. I do not believe there is a dry oxygen salt that is a conductor of electricity sufficient to allow a current to pass through a strip of paper impregnated with it. If it was moistened to permit of conductivity, the moisture would be evaporated before carbonization, because the water could not exist at a high temperature sufficient to carbonize. And if the water was dissipated, the oxygen salt would not be a conductor.

54 Q. Referring to the answer Q. 67 of Albon Man, what comment, if any, have you to make upon that?

A. I do not see that the treating of the paper carbon by a hydrocarbon gas, to deposit hard carbon, improves the paper carbon. If the paper carbon was originally bad, it will always remain so. If it is coated by deposition of hard carbon, the light is radiated then from a hard carbon and not from a paper carbon. If the paper carbon is to have a deposit of this hard carbon placed over it, and within it, it doesn't matter whether the paper carbon is good, bad, or indifferent, or is any other form of carbon, or even a metal. The incandescing conductor of the lamp becomes really and truly a hard-carbon conductor, as the major portion of the current passes through the hard carbon and all the light is radiated from it.

3070 If a paper carbon is dipped in different hydrocarbons several times, and recarbonized each time, a deposit of hard carbon takes place on the surface as well as within the paper. The use of a hydrocarbon for depositing hard carbon by electrical incandescence, is only a method for rendering a useless carbon available in an electric lamp.

It is, in fact, an*d* evidence of the imperfection of the carbon paper.

Answer objected to as being mere argument and not any statement of facts responsive to the question, the answer being mere criticism.

55 Q. In the foregoing answer have you expressed an opinion simply as an expert, or spoken from knowledge derived from experiments made by yourself?

A. Derived from experiments made by myself.

56 Q. Referring to the answer of Albon Man to the 80th question, what effect would the glue mentioned in the answer have in the employment of the paper carbon for incandescence in a lamp?

A. The effect would be that when the same was placed in the lamp it would be carbonized, and a great amount of smoke would come out and obscure the globe. This is from my actual knowledge.

57 Q. Calling your attention to the answers of Albon Man to questions 83, 84 and 85, I ask what would be the result of carboniz-

ing the paper described, in the way described, and working it down after carbonization as described.

A. The result of using several thicknesses of blotting paper pressed together would be that when they were carbonized they would all separate, each would be contorted in a different manner, and I do not believe they could be used or worked down, as stated by Mr. Man. I know this from my own experience. Could they have been kept together, which was impossible, according to the method of carbonizing described by Mr. Man, they might 3071 possibly have been worked down by emery paper, providing they were large enough, but from the sizes given by Mr. Man in another part of his testimony, I do not see how it is possible. It would seem that the proper method would have been to cut the paper in the form desired, and then carbonize it, instead of cutting it in a form not desired, and then working it down after it was carbonized.

That is a method of manufacturing by machinery or appliances

58 Q. I call your attention to the sketch Sawyer's Exhibit No. 3, Albon Man, and ask if it would be possible for the spring clamp there shown to clamp the ends of the carbonized paper described.

A. I do not see how a practical lamp could be made with such clamps. Mr. Man has testified that the width of the carbon was from $\frac{1}{12}$ to $\frac{1}{20}$ of an inch, and as these carbons rest upon the plate of platinum, *c*, in the sketch, the length of the spring portion of the clamps would only be from one-twelfth to one-twentieth of an inch. This is manifestly absurd.

59 Q. I call your attention to the answer of Wm. E. Sawyer to the sixth question, and ask if such a carbon was used as an incandescent conductor in an electric light, what would be the source of light in the incandescent conductor.

A. The source of light would be a hard gas carbon and not the paper carbon.

69 Q. I call your attention to the answer of Wm. E. Sawyer to the eighteenth question, and to what is there stated about candle power, duration of burners, and fracture, and ask you to state from your own knowledge the results that would follow from the various conditions named in the answer.

A. The life of the lamp would depend upon the unit incandescence. Referring to Mr. Sawyer's answer to cross-question fifty-three, I have made a calculation as to the radiating surfaces of the carbon whose size has been given by Mr. Man, and as to that of the carbon in my exhibit marked "Edison's Commercial Incan- 3072 descent Lamp," and find that the candle power per unit surface is greater in my lamp at sixteen candles than in the lamp described by Mr. Man, giving thirty candles. In giving candle powers, the total radiating surface is the main factor which should be always given.

Had I the same radiating surface in my lamp it would have given about thirty candles, and lasted just as long, theoretically. Practically it would last longer, as the smaller and lighter the carbon the more difficult it is to manufacture it so perfect. To show how absurd it is to give candle power without the radiating surface, one might make a lamp that would give twenty-five candles when only brought up to a yellow heat. From my experience I should judge that the carbon made of the material and in the manner specified and used under the conditions specified, would last on an average about as long as was stated by Mr. Sawyer in his communication to the New York papers, about December 22d or 23d, 1879, that is, they would not last more than a few minutes. In fact, Mr. Sawyer stated in a communication to the N. Y. Sun, December 22d, 1889, which is now before me, and dated from 78 Walker street, Dec. 21st, that a carbonized paper lamp would not last three hours and also stated that in practice it would not last twenty minutes, in a perfect vacuum. Now, as Mr. Sawyer did not get anywhere near a perfect vacuum, and yet from his experiments predicated the statement that even in a perfect vacuum they would not last twenty minutes; the results obtained by Messrs. Sawyer and Man can be readily surmised. They were undoubtedly very dismal failures.

The article from the N. Y. Sun of December 22d, 1879, referred to in the foregoing answer is put in testimony and marked Edison's Exhibit No. 8.

The exhibit is objected to upon the ground that there is no evidence that it was published in the N. Y. Sun, or that Mr.
3073 Sawyer wrote it. All reference made to the article in the witness' answer is objected to on the same ground. And upon the further ground that the article is not in evidence in any sense.

61 Q. Refer, if you please, to the description given by the witnesses for Sawyer and Man and the sketches and drawings referred to by them in the printed record of Sawyer and Man's testimony, and taking into view the incandescent conductors employed, and the heat radiators employed, and the other parts of the lamp, would such a lamp, in your opinion, be a practical lamp or not, giving reasons for whatever opinion you may express?

A. No, sir, it would not be a practical lamp. The testimony of even Messrs. Sawyer and Man, and the statements of Mr. Sawyer and his witnesses prove that it is not a practical lamp. No lamp has ever yet been devised up to the present date that was practical which had an enclosing chamber partially made of a cup of metal and secured to the glass by cements. In fact, Mr. Sawyer states the same in his patents, and shows many devices to obviate this defect. A sufficiently high vacuum cannot be obtained in chambers of this character to prevent oxidation and electric convection of the carbon. When the globe is filled with nitrogen the atmospheric gases will still pass in, in the manner described by Graham in his experiments upon the transpiration and diffusion of gases. A great many inventors, including Messrs. Sawyer and Man, place their carbons in an atmosphere of nitrogen, on the theory that nitrogen is inert towards carbon. It is well known that carbon at high incandescence combines with nitrogen to form cyanogen, and the cyanides due to ash of the carbon. My assistant, Dr. Moses, has obtained a

chemical reaction for cyanogen compounds, formed by electrical incandescence of carbon in an atmosphere of nitrogen. To obviate the defects of an imperfectly sealed chamber, Messrs. Sawyer
3074 and Man introduce nitrogen gas, upon the theory that if the atmosphere in the globe is at the same atmospheric pressure as the exterior atmosphere, there will be no tendency of the oxygen of the exterior atmosphere to pass within the globe, and that nitrogen is inert towards carbon. Both of these theories are wrong.

Another reason why the lamp would not be a practical lamp is that the carbon in the lamp which Mr. Sawyer testifies was the perfected lamp is not provided with thickened ends, whereby the incandescence of the carbon is reduced; hence it can only have its incandescence due to the passage of the current reduced by conduction of the heat away from the carbon at the point of contact. The carrying capacity and heat conductivity of these clamps are so small, compared to the size of the carbon, and the incandescence which it is necessary to bring the carbon up to to give, say twenty candles, that the carbon at the points of contact would be partially incandescent, as the heat could not be conducted away fast enough, and a bad contact between the carbon and the clamps would necessarily follow, accompanied by small arcs, which would gradually increase and ultimately destroy the contact. The amount of energy lost by conduction would be far greater than that lost in the form of useful light. My assertions in this respect about the conduction of heat are verified by the construction of the lamp itself, where special means are employed in the way of radiators whereby the heat of conduction may be radiated so that the lamp will not get too hot. This energy is of course useless for light-giving purposes, and consumes nearly as much electricity as is required to produce a light of twenty candles in the carbon. The great heat also produces great differences of temperature in the enclosing case, and therefore difference in the expansion of portions of the case, which causes leakage from the atmosphere into the case. Another thing is, that if when the lamp is cold the gases within it are at the same
3075 pressure as that of the atmosphere, this result will be changed when the lamp is lighted. The gas within the globe becomes expanded, and there is a different pressure, the tendency of which, if there is leakage, is to force the gas out of the lamp until the pressures are constant. If this takes place, and the lamp is allowed to cool, then the atmospheric pressure will be the highest, and there will be a tendency for the atmosphere to pass into the globe. For these and other reasons which could be mentioned the lamp which Mr. Sawyer calls his perfected lamp is, in my view, entirely impractical, commercially, scientifically, or otherwise.

I have previously stated the reasons why it would not be practical, commercially, in a previous part of my testimony. Its resistance would be too low to admit of practical subdivision, on account of the great investment required for copper conductors. It would not be sufficiently economical, on account of the energy lost by conduction and by convection through the residual gas.

Counsel for Edison gives notice that reserving the right to put in certain patents, the data of which he will procure, and exhibits of experiments in 1878, for which search is now being made during the course of this examination, he here rests his examination of Mr. Edison, and offers him for cross-examination.

Counsel for Sawyer and Man gives notice that his cross-examination of the witness will be *de bene esse* as to all that part of the witness' testimony that is intended to show or goes to show that he made the invention previous to the date alleged in his preliminary statement, and that he does not intend that his cross-examination shall be construed as a waiver of any objection he may have entered of record, and that he will object and move to strike
3076 out, either before or at the hearing of the interference, any
re-examination of the witness, or any testimony or exhibit put in that does not refer to new matter brought out in the cross-examination.

Cross-examination by AMOS BROADNAX, Esq., counsel for Sawyer and Man:

62 X Q. In answer to question 1 of your examination-in-chief, you say you are an inventor by occupation. Please state what inventions you were working on in the summer of 1876.

A. I was working on telephones, acoustic electrical transmission, electric pens, multiple copying apparatus, duplicating ink, galvanic batteries, sextuplex telegraphs, duplex telegraph, manufacture of carbon articles, and other things which I cannot now remember.

63 X Q. How much of your time during the summer of 1876 were you engaged in working on telephones? I mean what time in the summer did you begin to work on telephones, and what time did you leave off.

A. I commenced to work on telephones in 1875. I have never left off since that date.

64 X Q. How much of your time was given to telephones during the summer of 1876?

A. It would be a difficult matter to divide my time up between all the things I was working on. I should say one-tenth of my time was given to speaking telephones.

65 X Q. Were you working in the summer of 1876 at one and the same time, or during the same period of time, upon all the inventions you mentioned in answer to 62 X Q?

A. Yes, sir, I think I was.

66 X Q. Was there any exigency in the development of either of the inventions referred to by you that moved you to carbonize paper?

3077 A. I have stated that one of the things I was working on was the carbonization of paper to form different articles. One of my assistants, Mr. Johnson, had formed or was about to form a company called the American Novelty Company, whose purpose was to work off some of the small inventions which I was making. The manufacture of a great many articles from carbon was one of these inventions. Among other things was an electrical sheep-shearing machine, an electrical drill, an electrical engraving machine, ribbon mucilage, and other inventions which I cannot now remember. They were small things. I think he had a list of about twenty.

67 X Q. What articles did you propose to manufacture of carbonized paper?

A. Battery carbons, strips of carbon for electrical resistances, dishes for use in making chemical reactions, and tissue paper as a non-conducting packing.

68 X Q. How many of these articles did you make?

A. We made four or five crucibles, a great many flat sheets, and a half a pound to a pound of carbonized tissue paper.

69 X Q. How long did you continue to work at your experiments in the manufacture of articles of carbonized paper, in the summer of 1876?

A. I should say we tried experiments on and off for perhaps two months.

70 X Q. Please to state when you began your experiments and when you discontinued them, as near as you can recollect?

A. As near as I can recollect it was in the summer of 1876.

71 X Q. Can't you state at what time in the summer of 1876, you commenced your experiments, and at what time you discontinued them?

A. I should judge that it was about June or July, 1876.

72 X Q. State, if you please, when it was that you next took up the subject of carbonizing paper?

A. I think about January, 1877.

3078 73 X Q. What circumstances moved you to return to the carbonization of paper in January, 1877?

A. Using it in a telephone.

74 X Q. How long did you continue to use carbonized paper in your telephone?

A. I think I used it as late as January or February, 1878; perhaps later. All my exhibits are in the telephone interferences, and I have nothing here to refresh my memory.

75 X Q. For what other purposes did you use carbonized paper in January, 1877?

A. I used it for resistances.

76 X Q. After January, 1877, did you discontinue the carbonization of paper?

A. No, sir. I think we carbonized paper when we wanted it, although we generally had plenty of it around the laboratory. If none of it suited our purpose, we generally carbonized what we required.

77 X Q. Why did you use carbon made of paper in your telephone and in your battery, in preference to carbon made of anything else?

A. Because it was in convenient form. We could get it in all the forms we wanted it. We also carbonized wood of various kinds, as well as paper.

Mix metallic Silicon with Kaolin or lime which will Cause them to glow

78 X Q. Had the carbon made of paper no other superiority for the purpose for which you wanted it beyond that of mere convenience in manufacture?

A. In our telephones we had to have it in a great many experiments very thin. Hence paper was the most convenient material to use. For nearly all the purposes for which we used carbon, it was the most convenient material. In our telephone experiments we used every kind and character of carbon, and every form and shape. In 1877 most all our thoughts were on carbon and plumbago. It was carbon from Monday morning to Saturday night, month in and month out, and always in connection with its interpolation in an electric circuit.

(Here follows diagram marked p. 3079.)

3080 & 3081 79 X Q. When did you turn your attention to the subject of electric lighting?

A. In September or October, 1877.

80 X Q. Please to describe the first electric lamp you made or caused to be made.

A. I think my first experiments were with heating platinum wires to incandescence. Afterwards, heating carbon paper up to incandescence in the atmosphere. Also coating the carbon with powdered glass, which, in melting, was to protect it from the atmosphere.

Also with powdered silicon. Also in the lamp marked "Edison's First Incandescent Lamp." Afterwards by the passage of current through pieces of boron and silicon, rendering them incandescent. Also silicon and boron placed between carbon points. All these experiments, I believe, were conducted between September, 1877, and January, 1878.

81 X Q. You do not answer my question, which is repeated.

A. The first carbon electric lamp, if it may be called an electric lamp, was a piece of carbonized paper, about an inch long, one-sixteenth of an inch broad, and six or seven thousandths of an inch thick, the ends of which were secured to clamps, which clamps formed the poles of a battery. The carbon was brought up to incandescence, and of course oxydized immediately. That was one of the '77 experiments. The first lamp *in vacuo*, if it may be called a lamp, was Edison's Exhibit First Incandescent Lamp. This consists, as will be seen, of two clamps, forming the poles, between which a strip of carbonized paper was placed and secured by clamping. The base of the lamp being placed over the mouth of the hold on the platen of the air pump, had the air exhausted from the globe as far as possible by our air pump, and the carbon brought up to incandescence after the air due to the first heating had been pumped out.

82 X Q. Did your first experiment in electric lighting consist of a section of carbon made of paper placed in an electric circuit
3082 in the open atmosphere, to which you applied a current and burnt up the carbon?

A. I have already stated that I first tried platinum, but we will leave this out of consideration; and my answer will be yes. It was a mere experiment with the carbon in open air. I knew beforehand what it would do. It was to ascertain, I think, the amount of current required to bring it to incandescence.

83 X Q. When was that experiment made? State the date, as near as possible.

A. It might have been in September or in October, 1877.

84 X Q. Was it surely in one or the other of those months?

A. I am not absolutely sure, but my impression is it was in either one of those months.

85 X Q. You are certain that it was in the year 1877?

A. Yes, sir; I know it from my Exhibits Nos. 4 and 5.

86 X Q. Was that the first attempt that you made to use carbon made of paper in electric lighting?

A. The first premeditated attempt to use paper for lighting by incandescence. I have stated that one of our objects in 1876 was to make carbons for electric lighting, but not by incandescence.

87 X Q. When did you make your next attempt to use carbon made of paper in incandescent electric lighting?

A. In September, October or November, 1878. I should say October is the month we started to make paper carbons.

88 X Q. You say that your first premeditated attempt at using carbon made of paper for incandescent electric lighting was in September or October, 1877, when you placed a piece of carbonized paper in circuit in the open air, for the purpose of ascertaining the amount of current to make it incandescent. And that your next attempt was in the fall of 1878. Now please to state whether 3083 this second attempt embraced the Exhibit "Edison's First Incandescent Lamp"?

Question objected to by counsel for Edison as containing a misstatement of the witness' testimony.

A. My second attempt was not in the fall of 1878. I have already stated in my testimony that my first attempt at making an incandescent carbon lamp, if it can be called a lamp, was made in September or October, 1877, and consisted in bringing a strip of carbonized paper up to incandescence in the air. And my next attempt to make an incandescent lamp with carbon paper, if it may be called a lamp, was that shown in Edison's Exhibit First Incandescent Electric Lamp, which was also made in 1877, within a day or two of the first experiment. The attempts made at coating the paper with glass and silicon are not taken into consideration in this answer.

The taking of further testimony was adjourned by consent to Wednesday, June 15, 1881, at 10 o'clock at the same place.

WM. H. MEADOWCROFT,
Notary Public, New York County.

Pursuant to adjournment, this examination was resumed June 15, 1881, at 10 o'clock a. m., at No. 65, Fifth avenue, same counsel present.

The witness, THOMAS A. EDISON, further answers to questions proposed by AMOS BROADNAX, Esq., counsel for Sawyer and Man, as follows:

89 X Q. Then, as I understand you, your first and second attempts at electric lighting with carbon made of paper were made either in the month of September or October, 1877, the second attempt being made within a few days of the first?

3084 A. Yes, sir; lighting by incandescence of carbon paper.

90 X Q. The first attempt was the use of the carbonized paper in the open air, and the second embraced the lamp marked "Edison's Exhibit First Incandescent Lamp."

A. Yes, sir.

91 X Q. Do you fix the time at which these attempts were made by the Exhibits Edison No. 4 and Edison No. 5?

A. Yes, sir; these exhibits refresh my memory as to experiments conducted at that time, and previous thereto.

92 X Q. What is there upon Exhibit No. 4 that calls your attention to any experiments made in electric lighting by incandescence with carbonized paper?

A. The exhibit merely refreshes my memory so as to enable me to state the date of the time when I did try experiments with carbonized paper. The exhibit is headed "electric light," and explains itself.

93 X Q. Do you find anything on the exhibit that makes any reference to electric lighting by incandescence with carbonized paper?

A. No, sir, I do not. I have already stated that the exhibit serves only to refresh my memory as to the date. The reason why boron and silicon were used is that they are not so sensitive to oxidation as the paper previously tried.

The last part of the answer is objected to by counsel for Sawyer and Man as irresponsive.

94 X Q. In whose handwriting is Exhibit No. 4?

A. Most of it is in my own handwriting.

95 X Q. There is a strip of Exhibit No. 4 torn out between the names of Mr. Charles Batchelor and J. Kruesi. Who tore that out?

A. I do not know. These papers were originally in books,
3085 and the books were all destroyed, and the sheets forming the
same, numbered and bundled together. The most of them
were used as exhibits in my telephone interference.

96 X Q. Was there any one else's signature written upon this paper between the names of Charles Batchelor and J. Kruesi?

A. I do not know. I do not think so. It looks as if it had been stuck on a paper file and torn off.

97 X Q. Who made the diagrams upon this paper Exhibit No. 4?

A. I did.

98 X Q. When were the diagrams and writings made upon this paper—so much of them as was made by you?

A. At the date stated thereon.

99 X Q. There are two dates on the paper. Which date do you mean—the date on the right-hand corner at the top, under which your name is signed?

A. I refer to the date November 1st, 1877.

100 X Q. There is a memoranda at the bottom of the paper as follows: "Copied in volume No. 1, Experimental Researches, page 115, September 28, 1878." Signed William Carman. Who is William Carman?

A. He was at that time, and is now, my book-keeper at Menlo Park.

101 X Q. Does that memoranda show the correct date of the record of this paper?

A. It shows the date when it was recorded in the book, as set forth.

102 X Q. Why was it not recorded until September 28th, 1878?

A. Because about that date we commenced collecting all the scraps and memoranda relating to experiments together, for the purpose of preserving them, and especially those relating to telephones, of which there were several thousand, now used as exhibits in the interference on telephones.

3086 103 X Q. Have you got that book in which this paper is recorded, and, if so, will you produce it for my examination?

A. I have it at Menlo Park, I think. I will have it brought in.

104 X Q. It appears by this paper that some time previous to November 1st, 1877, you had "tried boron ruthenium, chromium, and the almost infusible metals for separators in my electric light device. Boron is very high resistance, and would do if arranged thus." Then follows a diagram. It is then stated that "silicium, on the other hand, is of very low resistance, and would have to be arranged thus." Then follows another diagram. Then follows these words: "I think powdered silicium, mixed with lime or other very infusible non-conductors or semi-conductors, would be good." Now, if previous to the making of this paper by you, you had attempted the use of carbonized paper for incandescent electric lighting, how did it happen that you didn't mention it on this paper with the other substances or materials referred to by the paper?

A. Because I had got done with my experiments on carbonized paper. The results were so unsatisfactory, even when the carbonized paper was in the vacuum which we obtained. Its sensitiveness to oxidation was one of the factors which led me to try experiments on silicon and boron, which were not so sensitive to oxidation. I thought that as we could not get carbon to stand, that these non-oxidizable materials might be made to stand. I have had pieces of silicon, separating the two electrodes, incandescent for an hour at a time. Had the carbon experiments been as satisfactory, I would undoubtedly be able to present an exhibit in which some of them would be recorded.

104 X Q. Do the experiments referred to by this paper, Exhibit No. 4, make part of your efforts at electric lighting by incandescence?

A. Yes, sir; as well as my Exhibit No. 5.

105 X Q. Did you, at the time referred to by this paper, keep written memoranda of all your attempts at electric lighting?

3087 A. No, sir, I do not think I did.

106 X Q. Did you keep a written memoranda of all the experiments that yielded results of any value?

A. No, sir; I do not think I did. The exhibits themselves state that I tried experiments, and yet I have no record of them.

107 X Q. What is there in the paper, Exhibit No. 4, that satisfies your mind, that your first and second attempt at electric lighting by incandescence with carbonized paper was previous to the date of the paper?

A. It refreshes my memory as to the fact that I was trying experiments on electric lighting by incandescence, and it permits me to remember that my first experiments were with platinum and carbonized paper.

108 X Q. Then, as I understand you, you know certainly by this paper, that the experiments noted on it were made on or before its date, which is November 1st, 1877, and to the best of your recollection, the experiments with the carbonized paper embraced in your first and second attempt at electric lighting by incandescence, were made previous to the date of the experiments noted on that paper?

A. Yes, sir; that allows me to fix the date.

109 X Q. Did Mr. Charles Batchelor and Mr. J. Kruesi sign their names upon this paper in your presence at the time the paper was made?

A. I cannot say; our habit was to have the papers witnessed within a day or two of the date placed upon them.

110 X Q. Please to mark the diagrams on this paper, Exhibit 4, figures 1 and 2 respectively?

A. I have done so, as requested.

111 X Q. Does Fig. 1 of these diagrams represent a number of lamps set in multiple arc, and if so, please to designate the lamps by letter *a*.

A. It does so represent, and I have designated them by letters a, a^1, a^2, a^3.

3088 112 X Q. State, if you please, whether figure 2 represents lamps set in series, and if so, please designate the lamps by letter *b*.

A. It does so represent, and I have designated the lamps b, b^1, b_2.

113 X Q. The word "magneto," as I understand it, written by the two diagrams, is intended to designate an electric generator?

A. Yes, sir.

114 X Q. Who is Mr. Charles Bat-helor?

A. He is one of my assistants.

115 X Q. How long has he been in your employ?

A. About ten (10) years.

116 X Q. Who is Mr. J. Kruesi?

A. A machinist in my employ.

117 X Q. How long has he been in your employ?

A. I think about seven (7) years.

118 X Q. In whose handwriting is Exhibit Edison No. 5?

A. Nearly all in my handwriting.

119 X Q. When was it made?

A. On the day of its date, that is, December 3d, 1877.

120 X Q. Was this paper, Exhibit No. 5, witnessed by Charles Batchelor, M. N. Force, and J. Kruesi in your presence?

A. I cannot say.

121 X Q. Do you know the signatures of those gentlemen?

A. Yes, sir.

122 X Q. Can you swear that their signatures are signed upon this paper?

A. Yes, sir.

123 X Q. Can you swear when the signatures were made?

A. No, sir; but my impression is, they were made within a day or two after the date on the paper; that was our habit.

3089 124 X Q. And this paper, Exhibit No. 5, assures you that the experiments noted on it were made on or before the day of its date, and that to the best of your recollection, your first and second attempt at electric lighting with carbonized paper was made before the date of that paper?

A. I have already testified that it was made before the date of Exhibit No. 4, which is an earlier date than Exhibit No. 5.

125 X Q. Does either Exhibit No. 4 or No. 5 make any reference to your experiment with carbonized paper in electric lighting?

A. No, sir; they merely refresh my recollection as to dates.

126 X Q. Who made Edison Exhibit First Incandescent Lamp?

A. I don't know; we bought it. It was a well-known school apparatus for illustrating the electric brush *in vacuo.* The changes necessary to try the experiment on carbonized paper were made by or through the orders of Mr. Charles Batchelor.

127 X Q. Did you buy the lamp yourself?

A. I do not know, I cannot remember, but my impression is I did.

128 X Q. Where did you buy it?

A. I cannot remember that, but my impression is I bought it of a firm called Luhme & Co.

129 X Q. Where?

A. New York.

130 X Q. Give the street and number in New York?

A. I don't know the street or number; it was down near the post office.

131 X Q. Do you recollect what you paid for it?

A. No, sir.

132 X Q. Was the place at which you purchased it north or south of the post office?

A. It was south of Chambers street and north of Vesey street.

133 X Q. Was it west of Broadway?

A. And west of Broadway.

3090 134 X Q. Is that as near as you can locate the place where you purchased the lamp?

A. Yes, sir.

135 X Q. Have you now a distinct recollection that you did purchase the lamp yourself?

A. No, sir; I have only an impression.

136 X Q. Who do you think would have purchased it if you did not?

A. It might have been purchased by letter or by messenger boy.

137 X Q. You are sure it was purchased of the firm of Luhme & Co. in the city of New York?

A. No, sir; I am not; but my impression is that it was.

138 X Q. Were you in the habit of dealing with that firm?

A. I was in the habit of dealing with that firm; and a firm named Benjamin & Co., I think.

139 X Q. Where is the firm of Benjamin & Co.?

A. I think it is somewhere south of Chambers, north of Vesey and west of Broadway.

140 X Q. What does Luhme & Co. deal in, and what does Benjamin & Co. deal in?

A. In philosophical apparatus.

141 X Q. This lamp, Edison's Exhibit First Incandescent Lamp, that you say you think you purchased; what was the name of the apparatus when you purchased it?

A. My impression is, it is called a "Gassiot cascade."

142 X Q. What alterations did you make in this cascade to adapt it to your purpose in making your experiments in incandescing electric lighting with carbonized paper?

A. Clamps were placed in it to hold the carbon, and binding posts outside to hold the conducting wires.

143 X Q. How many experiments did you try with this lamp?

3091 A. My impression is that we tried two or three experiments.

144 X Q. How large was the piece of carbonized paper which you used in this lamp; give the length, the bre-dth and the thickness of it?

A. My impression is that it was about an inch long, three-sixteenths broad, and I think somewhere less in width than three-sixteenths; I should say they were eight-thousandths of an inch thick.

145 X Q. Did you carbonize the paper especially for these experiments?

A. I do not remember whether we used some carbonized paper we had on hand, or carbonized it expressly for the occasion.

146 X Q. How did you get the carbonized paper in the lamp?

A. Mr. Batchelor put it in.

147 X Q. You don't know how he got it in?

A. No, sir, I don't.

148 X Q. What degree of vacuum did you get in this lamp?

A. My impression is we got two and a half millimeters of mercury on a gauge, which represents, if the gauge was correct, that the column of mercury was within two and a half millimeters of a perfect vacuum.

149 X Q. How much is a millimeter in inches?

A. It isn't an inch; two and a half millimeters are about a tenth of an inch.

150 X Q. What was the resistance of the carbonized-paper burner that you used in this lamp?

A. I did not measure it.

151 X Q. What strength of current did you have on it?

A. We had about 50 cells of carbon battery, but I do not remember how many we used on it.

152 X Q. Did you get the carbonized paper to brilliant incandescence?

A. No, I do not think so.

3092 153 X Q. How long did the carbonized paper last in the lamp?

A. My impression is that it only lasted six or eight minutes.

154 X Q. How long was you engaged upon these experiments with this lamp?

A. I do not think more than a day.

155 X Q. Were they made at your laboratory, Menlo Park?

A. Yes, sir.

156 X Q. How did you exhaust the air out of the lamp?

A. By an air pump.

157 X Q. Was it a pump you had on hand, or did you buy it for the occasion?

A. A pump I had on hand.

158 X Q. Did you prepare the lamp for the experiment yourself, or did Mr. Batchelor prepare it?

A. Mr. Batchelor.

159 X Q. Did you see Mr. Batchelor put in the paper carbons?

A. I don't remember it.

160 X Q. How do you know that paper carbons were actually put in the lamp?

A. Because I told him to put them in, and I saw them after they were in.

161 — Q. How could you distinguish a carbon made of paper from any other carbon?

A. Very easily, by its looks.

162 X Q. How does it differ in appearance from carbon made of wood?

A. It is very difficult to describe the difference in appearance, still when once a person has seen the two, he can distinguish them readily; the fibres of the paper are still visible after carbonization, while the wood shows the cellular formation.

163 X Q. Why did you not continue your experiments upon the use of carbonized paper for incandescent electric lighting, in this lamp?

3093 A. Because the results did not warrant it.

164 X Q. Upon the conclusion of your experiments with

this lamp did you abandon the attempt at electric lighting by incandescence with carbonized paper?

A. No, sir; we laid it aside, and took up what we thought at the time was more promising—the use of silicon and boron for incandescent lighting.

165 X Q. State, if you please, whether the paper marked Edison Exhibit No. 1, is an illustration of your first attempt at electric lighting by incandescence, with carbonized paper, in the fall of 1877, about which you have been testifying?

A. No, sir; it is an illustration of experiments conducted in the fall of 1878.

166 X Q. In answer to question 9 of your examination-in-chief, which is as follows (counsel reads question and answer to witness); state, if you please, whether in that answer you referred to Edison Exhibit First Incandescent Lamp, which you subsequently produced.

A. Yes, sir.

167 X Q. Then, as I understand you, the attempt illustrated by Edison Exhibit No. 1, followed the attempt embraced in Edison Exhibit First Incandescent Lamp; the latter being made in September or October of 1877, and the former in October or November of 1878; I mean, of course, in incandescent electric lighting with carbonized paper.

A. Yes; this Exhibit No. 1, is an illustration of experiments conducted in September or October, 1878, with incandescence of carbonized paper.

168 X Q. Then this paper Exhibit No. 1, as I understand you, presents your third attempt at incandescent electric lighting with carbonized paper?

(Here follows lithograph marked p. 3094.)

A. No, sir; it represents the second in point of date. My understanding of "attempt" at incandescent lighting is, that it means all
those experiments made within a few days of each other,
3095 forming a group. The experiments in 1877, are my first
attempt, those in 1878, my second attempt, and those in 1879
my third attempt.

169 X Q. Well, then, referring to Edison Exhibit No. 1 as your second attempt, please to state whether the exhibit is intended to represent the whole or a part of an experiment with carbonized paper in incandescent lighting in vacuum.

A. They represent a few of the experiments tried at that time on the incandescence of carbonized paper, but not *in vacuo.*

170 X Q. Please to describe the first electric lamp or apparatus in which you used carbonized paper for incandescent electric lighting *in vacuo*, in October or November of 1878?

A. My impression is that it consisted of a piece of carbonized paper coated with tar and lamp-black, and carbonized, placed in clamps connected to the circuit, and placed under the bell jar of the vacuum pump. I am not absolutely sure that this experiment was tried in September or October, but it was tried not later than December, 1878.

271 X Q. What do you mean by the "bell jar" of the vacuum pump?

A. The bell jar that usually accompanies vacuum pumps, in which the vacuum is obtained.

172 X Q. Was the bell jar of glass?

A. Yes, sir.

173 X Q. Please to illustrate the arrangement and describe it by letters of reference.

A. This sketch represents the arrangement as I recollect it. A represents the platen and bell jar of the vacuum pump; B is the bell jar, *c* is the platen, *d* and *e* are binding posts; *f* and *g* of figure 2 are metal pieces, connected through the iron of the platen to the binding posts; *h* and *k* are insulating pieces; *m* and *n* are metallic prongs which fit against these metallic pieces *f* and *g* when pressed down on their sides. This connects the circuit with *m* and
3097 *n*. The electrode, *p*, holding the carbon, is connected to *n*,
while the other electrode connecting the other end of the carbon, and marked Q, is connected by a wire with *m*. Thus the circuit was complete from one binding post to the other through the carbon when the bell jar was on. The bell jar represents the vacuum chamber of the pump in which the light was produced.

This sketch is put in evidence by counsel for Sawyer and Man as an illustration of the witness' testimony, and marked Edison Exhibit No. 9.

(Here follows diagram marked p. 3096.)

174 X Q. How many experiments did you make with carbonized paper in the vacuum chamber of this pump as you have described?

A. My impression is that we made three or four experiments.

175 X Q. Were the experiments made by you personally or in your presence?

A. I think they were made by myself and Mr. Batchelor, and perhaps Mr. Upton.

176 X Q. Who prepared the pump for the experiment?

A. I don't remember.

177 X Q. Did you witness the experiments yourself?

A. I witnessed some of them.

178 X Q. Did you see the carbonized paper put in the vacuum chamber?

A. I saw it in the chamber. I don't remember seeing it put in.

179 X Q. Are you able to swear of your own knowledge, that the carbon in the vacuum chamber was made of paper?

A. Yes, sir; some were made of paper and some of carbonized broom-corn.

180 X Q. Were the papers carbonized expressly for the experiment?

A. I think they were carbonized for the experiment shown in

Edison Exhibit No. 9.

Exhibit 1, and had been carbonized previous to this last experiment.

3098 181 X Q. Do you mean that they were carbonized expressly for those experiments which you say were made in October or November of 1878, and were they carbonized at the time of the making of those experiments?

A. Mr. Batchelor, I believe, had made fifty or more of these carbons for experiments in September or October, 1878, some of which are illustrated as used in Exhibit No. 1.

182 X Q. What size were the carbons used in the experiments made with the pump?

A. My impression is that they were about one-thirty-second in diameter, and an inch or two inches in length.

183 X Q. Was the carbon that you used in Edison Exhibit First Incandescent Lamp, straight or curved?

A. Straight.

184 X Q. What was the success of your experiment with carbon in the vacuum chamber of the pump?

A. We could not make the carbon stand, although we had pieces of potassium, and also sodium within the chamber.

185 X Q. What was the resistance of the burner?

A. We didn't measure it.

186 X Q. What was the strength of the current?

A. I think the strength of the current was 4 or 5 vebers, or 4 or 5 thousand foot pounds.

187 X Q. What degree of vacuum did you have upon the burner?

A. I think about 2½ or 3 millimeters, which we read off from a mercury gauge which came with the pump, and was the best vacuum generally obtainable with a pump.

188 X Q. Please to describe the next lamp you made, if any, in October or November of 1878, in which you used carbonized paper for incandescent lighting in a vacuum.

A. I don't think we tried any other experiments than the ones I have here recited *in vacuo*, in 1878.

3099 189 X Q. That, then, as I understand you, completes what you call your second attempt at electric lighting by incandescence with carbonized paper?

A. That, and including the devices illustrated in Exhibit No. 1 and patent No. 224,329, this arrangement being similar to that shown in Mr. Sawyer's patent 219,771, dated September 16th, 1879.

190 X Q. Do you wish to be understood as saying that you made a lamp in the fall of 1878 like that shown and described substantially in patent 224,329, dated February 10, 1880, and used carbonized paper in it for incandescent electric lighting?

A. Yes, sir; we used carbonized paper and carbonized broomcorn in it in September, October or November, 1878.

191 X Q. Does the specification making part of that patent, make any reference to the use of carbon made of paper?

A. No, sir, it does not—it merely mentions carbon, and does not mention the kind of carbon.

192 X Q. Why did you not describe in that specification the use of carbon made of paper in that lamp?

A. Because that was not a part of the invention. We made these slender pencils of carbon, because it was the easiest way to make carbon, as we had no mill for grinding carbon or mold for molding it, and hence made the pencils in the most convenient way, such as coating paper with tar and rolling it up and carbonizing it, and also by carbonizing broom-corn.

193 X Q. Did you make and use an electric lamp like that of the patent last referred to in the fall of 1878?

A. Yes, sir.

194 X Q. Then, in addition to the experiments made with the paper carbons in the vacuum chamber of the pump in the fall of 1878, you also experimented with the same kind of carbons in the lamp of the patent 224,329, as I understand you?

A. Yes, sir.

3100 & 3101 195 X Q. Were the experiments with the lamp of the patent referred to made *in vacuo?*

A. No, sir; they were made in the open air, and were to obviate the use of a vacuum.

196 X Q. At the time you experimented with this lamp of the patent referred to, had you discovered the superiority of carbon made of paper for incandescent electric lighting over other carbon?

A. No; only it was very convenient material to use.

The taking of further testimony was adjourned by consent to Thursday, June 16, 1881, at 10 o'clock, a. m., at same place.

WM. H. MEADOWCROFT,
Notary Public, N. Y. Co.

Pursuant to adjournment this examination was resumed June 16, 1881, at 10 a. m., at No. 65 Fifth avenue, same counsel being present.

Cross-examination continued:

The witness desires to add to his last answer the following:

My answer is changed to this: No; only it was very convenient material to use, and was organic carbon.

198 X Q. Referring now to Edison's commercial incandescent electric lamp, state when it was that you first made a lamp of the form and substance of this exhibit?

A. I think duplicates of this lamp, as to form, shape and material, were made some time in October, 1879.

198 X Q. Have you got the original lamp of the form of this exhibit?

A. I have not been able to find it within the last two or three days, but my impression is that I can produce one of the first six made.

3102 199 X Q. Was the first one of the same size that this exhibit is?

A. The globe was about the same size. It was made in the same manner, except that the paper, which was parchmentized paper, was wider than it was thick, and was bent over in the form of an arch.

200 X Q. Were the metal conductors put in in the same way they are put in this exhibit?

A. Yes, sir.

201 X Q. Was there a section of platinum interposed in the conductor between the copper and the carbon?

A. Yes, sir.

202 X Q. And the interior glass bulb was contained in it the same as in this one, was it, and the lamp sealed in the same way?

A. Yes, sir.

203 X Q. Please to give the dimensions of the carbons used in those first lamps like this exhibit.

A. The first lamp of this peculiar character with paper carbon, had a carbon about a thirty-second of an inch wide, six or eight thousandths of an inch thick, and about two inches and a half to three inches in length before carbonization. It was cut straight and had thickened ends, and was bent in the form of an arch before carbonization. After being put in the lamp, the height of the arch, I should judge, was about an inch or an inch and an eighth. Within a day or two afterwards we cut loops out of paper of the form desired, the same as shown in my Exhibit Commercial Incandescent Electric Lamp, and the same as shown and described in my application in this interference.

204 X Q. Referring still to the first lamps like this exhibit, state, if you please, what resistance the carbon had in those lamps.

A. The resistance of a unit length and mass of paper carbon is generally the same, whether the lamp has one ohm or a thousand ohms' resistance. The resistance of the whole carbon probably was a hundred and twenty-five ohms cold, and perhaps 75 ohms
3103 at sixteen candles. Carbon decreases its resistance when
heated, but not in direct proportion to the rise of temperature. I do not think we measured the resistance of the carbon in the first lamp, but only judged it.

205 X Q. To what degree of perfection did you get the vacuum in the first lamps like this Exhibit Edison's Commercial Lamp?

A. My impression is that they were exhausted to the one-millionth of an atmosphere.

206 X Q. To what degree of luminosity did you raise the carbon?

A. I think we raised it as high as 30 or 40 candles.

207 X Q. How long did it last, raised up to that degree of luminosity?

A. We did not keep it for more than half an hour at that degree of luminosity. My impression is that at from 12 to 16 candles it lasted over a hundred hours.

208 X Q. Of continuous illumination?

A. Of continuous illumination, yes sir.

209 X Q. Referring now to this particular lamp, Edison's Exhibit Commercial Incandescent Lamp, you say in answer to Q. 33, exami-

nation-in-chief, that it burnt either 70 hours and 18 minutes, or 250 hours and 40 minutes. Can't you state any more definitely than that the time that the lamp did actually burn?

A. No, sir, I cannot. In my book, in which is recorded the life of 150 or more lamps, I find that the record of the life of this lamp is put down in ink as 251 hours and 41 minutes; but this has been partially scratched off, and 70 hours and 18 minutes substituted.

210 X Q. And you cannot tell which is the correct data, as I understand you?

A. No, sir.

211 X Q. Please to read from your record book all the memoranda and data you have in writing that refers to this particular lamp—Edison's Exhibit Commercial Incandescent Lamp.

A. I think I have other records of this lamp, and will
3104 try and find them. I read now from the book referred to, page 39:

"Street lamp top of stairs, right hand, 235.

Resist ——— January 2d, noon. Burnt. 40. January 3d, 19.30; Jan'y 4th, 9.58; Jan'y 5th, 20.50; Jan'y 5th, 3.47;

6, 20.26; 7, 12.15; 8, 22; 9, 9; 9, 6.50; 10, 19.15; 11, 7; 12, 11. Total time burnt, 70.18. Carbon bu-sted.

Total time burned, 207.36 up to 5 p. m.

251.41 up to noon."

A portion of the record is scratched out.

212 X Q. Please to permit me to examine the record from which you have read in answer to the last question.

(Witness hands the record to the counsel.)

213 X Q. Does this record show the resistance of the lamp?

A. No, sir.

214 X Q. Does it show the luminosity of the lamp?

A. No, sir.

215 X Q. Does it show the degree of vacuum in the illuminating chamber?

A. No, sir.

216 X Q. Does it show when the record was made?

A. It shows that it was January 2d, at noon, but does not state the year; but on page 38, one page before this record, lamp 153, a date, January 2d, 1880, is recorded, and I know that this was in 1880. Lamp 153 had a resistance of 132 ohms, and lasted over 200 hours.

Last part of answer objected to by counsel for Sawyer and Man as irresponsive and impertinent, as no inquiry is being made about the record of lamp 153.

217 X Q. Can you swear that this record you have quoted was made January 2d, 1880?

3105 A. I can swear it was made within four or five days of that date. I think I shall be able to produce a witness who made these records.

218 X Q. In whose handwriting is this record you have quoted?

A. In Mr. Batchelor's handwriting, and Mr. Herrick's, I think.

219 X Q. Which of it is in Mr. Charles Batchelor's handwriting and which of it is in Mr. Herrick's handwriting?

A. The words "Street lamp, top of stair, right hand. Resist. B*ru*nt 40," are in Mr. Charles Batchelor's handwriting, and all the rest is, I think, in Mr. Herrick's writing.

220 X Q. How does it happen that the date of the record is Jan. 2, noon, and the burning of the lamp appears to have commenced on January 3d, and continued down to January 12th, taking the whole of the dates into account, including those that are crossed out?

A. It could not have commenced on January 3d, because the record states that up to January 3d it had burned 19.30, which means 19 hours and 30 minutes from January 2d; it had also burned 40 hours before January 2d.

221 X Q. Apart from this record, have you any distinct recollection of the burning of this lamp?

A. I have an indistinct recollection. It would be a hard matter to recollect any particular lamp out of a hundred nearly all alike. Upon the lamp it is marked "Depot," and I remember it there. It was in a very conspicuous place and must have been seen by many thousand people.

222 X Q. You did not make this record yourself, as I understand you, and did not see it made?

A. I did not make it myself. I don't remember that I saw it made; but I remember that I watched these records pretty closely, and must have seen it within a day or so after it was made.

3106 223 X Q. How does it happen that the whole record was not made by one person?

A. I think because Mr. Batchelor started the record, and then got an assistant to carry it out more in detail. He will, doubtless, be able to testify on that subject.

224 X Q. Are you able to swear that the record was made as it appears here, all at one time, and that that time was during the performance of the lamp that is noted here?

A. I am able to swear that I believe it to have been made in the manner and on the dates set forth in the record.

225 A Q. Is part of the record in lead pencil and part of it in ink?

A. Yes, sir.

226 X Q. Please to state what part is in lead pencil?

A. Figures "235, street lamp, top of stairs, right hand. Resist. Burnt 40. January 2, noon, 70.18; and some cross pencil marks.

227 X Q. Please state what part of the record remains intact—that is, not crossed out?

A. "235, street lamp top of stairs, right hand. Resist. Burnt 40. January 3, 19.30; 4, 9.50; 5, 20.50. Total time burned: 70.18; January 2, noon."

228 X Q. Is the rest of the record crossed out with ink and lead pencil?

A. Yes, sir.

229 X Q. Who crossed it out, and when was it done?

A. I don't know who did it, or when it was done.

230 X Q. Now, this lamp, Edison's Exhibit Commercial Lamp, and those few that preceded it, about which you have testified this morning, embrace, as I understand you, your third attempt at electric lighting by incandescence, with carbonized paper?

A. I testified regarding a few, but there were more than a hundred made by the end of December, 1879, all of this character,
3107 with carbonized paper. These constitute my third attempt in connection with all that I have done since.

231 X Q. What I want to know, Mr. Edison, is whether this lamp and all the lamps that you made having the form and substance of this lamp, "Edison's Exhibit Commercial Incandescent Lamp," embraced your third attempt at electric lighting by incandescence, with carbonized paper?

A. In October we commenced making lamps of the same character as to form, with paper carbon, as shown in Exhibit Edison's Commercial Incandescent Lamp, and have continued to make them ever since. This is my third and successful attempt at lighting by the incandescence of carbon made from paper.

232 X Q. Do you mean to swear, now, that your first and second attempts at electric lighting by incandescence with carbonized paper, were successful?

A. The first attempt I did not consider successful, except that it showed that if carbon could be made to stand, that it could be made successful; and my second attempt was successful in the form shown in patent No. 224,329, but *in vacuo* it was not successful, except that it proved that carbon from paper or organic material, would be a success for lighting by incandescence, if it could be made to stand.

233 X Q. How long did you use the lamp of patent 224,329?

A. My impression is that we used it several days.

234 X Q. Have you got any memoranda in writing of its performance?

A. I do not think I have, that is dated.

235 X Q. Have you got any written record that you can swear represents the performance of this lamp?

A. I think among my records I may have something, but in hunting I neglect generally these records that have no dates.

236 X Q. How much of the time did you use this lamp with carbonized paper?

3108 A. I should say carbonized paper was used in it on and off several hours, burning. In this lamp we used both carbonized broom-corn and carbonized paper?

236½ X Q. Is the illuminating portion of this lamp intended to be inclosed in a glass chamber?

A. Yes, sir; partially of glass.

237 X Q. Between the time that you discontinued your experiments in electric lighting by incandescence with carbonized paper, in the fall of 1877, and the time you commenced to experiment again upon the same subject, in the fall of 1878, as you have testi-

fied, was you engaged any of the time in experimenting upon electric lighting by incandescence?

A. My impression is that I did try some experiments in electric lighting by incandescence, but I can find no record to refresh my memory.

238 X Q. If you have any distinct recollection of any experiments made within the period mentioned in my last question, please to describe them?

A. I only have an impression.

239 X Q. You can't describe any experiments.

A. No.

240 X Q. Now, between the time that you discontinued your experiments in incandescent electric lighting with carbonized paper, in the fall of 1878, and the time you commenced them again with carbonized paper, in the fall of 1879, did you make any experiments in electric lighting by incandescence?

A. Yes.

241 X Q. What substance or material did you use for the illuminating portion of your lamp in such experiments?

A. Platina and other materials.

242 X Q. How much of the time embraced within my question (240 X Q.) were you engaged in experimenting with platinum and material other than carbon?

A. Except perhaps some experiments with carbon in January, 1879, we were engaged night and day between the times named.

3109 243 X Q. During the period included in my X Q. 240, how many experiments did you make in incandescent electric lighting with carbon that was not made of paper?

A. I don't remember any experiment made with carbon that was not made with carbon paper or carbonized broom-corn.

244 X Q. What experiments did you make with carbon made of paper in January, 1879?

A. In some form of lamp anal*a*gous to that shown in patent 224,329.

245 X Q. Please to describe the lamp in which you employed carbon made *for* paper *from* incandescent lighting in January, 1879?

A. It was a lamp similar to Fig. 2 in the patent 224,329.

246 X Q. How did it differ from the lamp described in the patent mentioned in your last answer?

A. I think the carbon was shoved down by a spiral spring.

247 X Q. How much carbonized paper did you use in such lamp?

A. Perhaps a length of it; about two or three inches.

248 X Q. Can you produce that lamp?

A. No, sir; it is substantially the same kind of a lamp as that shown in Fig. 2, patent 224,329.

249 X Q. Was the carbonized paper used *in vacuo*?

A. No, sir.

250 X Q. What was your object in making this experiment with carbonized paper in January, 1879?

A. To make what we called a "shop lamp"—one in which the current only had to be subdivided in a shop and not over a large area, where high resistance was not absolutely essential.

251 X Q. Why did you use carbon made of paper in preference to carbon made of anything else in that lamp and for that experiment?

3110 A. Because it was easy to make and produced the proper kind of contact desired, and we had no means of making hard carbons with any degree of facility.

252 X Q. Was the paper specially carbonized for that experiment?

A. I cannot remember.

253 X Q. Was the experiment made in your presence?

A. I think I made it myself.

254 X Q. What was the result?

A. It worked fairly.

255 X Q. Why have you not mentioned this experiment in your previous testimony?

A. I forget why; perhaps because the question has not been asked me.

256 X Q. Did you make any other experiments between the fall of 1878 and the fall of 1879 with carbonized paper for incandescent electric lighting than those you have already testified about?

A. No; I think not with carbonized paper.

257 X Q. Have all of your attempts of electric lighting been by incandescence?

A. No, sir; not all, but most all.

258 X Q. Is it your conviction now that electric lighting by incandescence can be successfully accomplished with carbon made of paper *in vacuo?*

A. Yes, sir; it was successfully accomplished by me.

259 X Q. State, if you please, when it was that you first reached the conviction that electric lighting could be successfully accomplished by carbonized paper *in vacuo.*

A. In September or October, 1879; that it could be accomplished by the use of carbonized paper in high and stable *vacuo*, which were the proper conditions.

260 X Q. Did you, previous to September or October, 1879, make and use carbonized paper for electric lighting by incandescence *in vacuo*, successfully?

A. I have already testified on that point quite clearly. My answer will be the same as answer to X Q. 232.

3111 261 X Q. The answer to X Q. 232 does not answer my last question which is repeated.

A. My previous answer answers it perfectly.

262 X Q. What do you understand by the word "successful," in the relation that I used it in X Q. 260?

A. Several understandings have passed through my mind. Sometimes an experiment is a successful experiment when it don't work, if it proves positively or negatively, or shows possibilities. It may or may not be considered successful, and in my answer to X Q. 232

I have stated fully about the success and non-success of these experiments.

263 X Q. In cross-question 260 I did not ask you anything about experiments, but about successful lighting, and I now ask you again, when you first succeeded in lighting successfully by incandescence with carbonized paper *in vacuo?*

A. If you mean when I first succeeded successfully in lighting up a piece of carbonized paper *in vacuo* by electrical incandescence, I will state that it was done in Edison's Exhibit First Incandescent Lamp.

264 X Q. How long did you say you succeeded in illuminating that lamp with carbonized paper *in vacuo?*

A. Several minutes, but the vacuum was a poor one.

265 X Q. Well, how many minutes?

A. Perhaps ten minutes.

266 X Q. Do you consider an electric lamp that goes out in ten minutes successful lighting by electricity?

A. It is the successful lighting of the lamp for ten minutes by electricity.

267 X Q. Are you now making and using incandescent electric lamps in which you use carbonized paper for the illuminating portion of the lamp *in vacuo?*

A. Yes, sir.

268 X Q. How do the lamps you are now making and using differ from the Exhibit Edison's Commercial Incandescent Lamp?

3112 A. Differ only in shape.

269 X Q. How does the shape differ from the exhibit?

A. The carbon is in the form of an arch, but does not come together at the electrodes so near as in the exhibit.

270 X Q Is the glass chamber of the same form?

A. Some lamps are, and some are pear-shaped.

271 X Q. Is the carbon of the same dimensions that you have given of the carbon in the exhibit?

A. Pretty near the same, I think; I have none here for comparison.

272 X Q. How many of these lamps have you in use?

A. I cannot say; they have been sent all over the world. We have a stock on hand for use when other necessary appliances are ready.

273 X Q. State approximately how many you have sold or have in use?

A. We have sold three or four hundred.

The taking of further testimony was adjourned by consent to Friday, June 17th, 1881, at 10 o'clock, at same place.

WM. H. MEADOWCROFT,
Notary Public, N. Y. Co.

Pursuant to adjournment, the examination was resumed June 17th, 1881, at 10 a. m., at No. 65 Fifth avenue, same counsel being present.

Counsel for Edison produces record book containing the copy of

Edison's Exhibits Nos. 4 and 5, and submits it to the inspection of counsel for Sawyer and Man.

3113 274 X Q. Referring now to your Record Book No. 67, pages 1 to 15, inclusive, of which Exhibit No. 3 is an alleged copy, please to state whether this record was kept by you personally.

A. No, sir; it was not.

275 X Q. Please to state by whom it was kept.

A. Partially by Charles Batchelor, and partially by a man named Herrick, I think.

276 X Q. Was it kept by those persons in your presence?

A. I was present; I should say almost all the time in the room with the parties when this record was made.

277 X Q. In whose handwriting is the record?

A. Partially in Batchelor's, partially in Herrick's, I think, and some of my writing is on it.

278 X Q. Were the entries made in that record by the different persons mentioned all made at the same time?

A. About January 1st, 1880, it was decided to keep the burning time of the lamps manufactured, and this record was the starting point of the time, and was started in a systematic manner by Mr. Batchelor, I believe, on January 2d, 1880, and he, I believe, put down on January 2d the numbers of the lamps, their position, and the time they had burned previous to January 2d; and thereafter the exact burning hours were kept by him and Mr. Herrick, and the entries, I believe, were made the day after the date on the entries.

279 X Q. These lamps to which the record refers, when were they made?

A. Some time in December, 1879.

280 X Q. Is a portion of this original record in lead pencil?

A. Yes; a very small portion.

281 X Q. By whom was that portion of it made?

A. One portion by myself, and the other portion by Charles Batchelor.

3114 282 X Q. When did Mr. Batchelor make his entries in lead pencil, and when did you make yours?

A. I made mine January 5th, 1880. Mr. Batchelor has dated his entry January 2d, 1880, 8 p. m. I believe that I know that he made that entry at that time.

283 X Q. Are the figures in ink that note the day of the month, the number of hours and minutes the respective lamps burned, in the handwriting of Mr. Herrick?

A. I think a part of them are in Mr. Batchelor's handwriting, and part in the writing of Mr. Herrick.

284 X Q. And these figures were made, you think, either on the day of the date or the day after?

A. Yes, sir; I think they were.

275 X Q. Do you know that of your own knowledge?

A. Yes, sir; I am almost certain.

286 X Q. When did you get the vacuum pump illustrated by Edison Exhibit No. 6?

A. That particular shape of vacuum pump was made some time in September, 1879.

287 X Q. Previous to getting that pump, did you succeed in getting a satisfactory vacuum in your lamps? I mean a vacuum in which your carbon burners would endure incandescent for any reasonable length of time?

A. Yes, sir.

288 X Q. When did you first succeed in getting such a vacuum?

A. I think it was in August, 1879, that we had a pump that would produce a vacuum up to perhaps the hundred-thousandth part of an atmosphere.

289 X Q. Was that the first you obtained the necessary vacuum in your lamp?

A. My impression is that that was the first pump by which a partially satisfactory vaccuum was obtained.

290 X Q. Referring now to Edison Exhibit No. 2, being the New
York Herald, or part of it, dated December 21st, 1879, state,
3115 if you please, whether you wrote or caused to be written the
article headed "Edison's light," on page five, and to be illus-
trated as there illustrated?

A. No, sir: I did not write it, nor did I cause it to be written.

291 X Q. Did you revise or examine it after it was written, and approve of it?

A. No, sir; I did not.

292 X Q. Are the statements true?

A. Some are, and some are not. The article seems mostly to be made up from my patents, into which a great deal of romance has been injected.

293 X Q. Are the illustrations true illustrations of the lamp referred to in the article?

A. Not strictly true. Most of them have been taken from the patents. Two I recognize as having been taken from the Scientific American.

295 X Q. Which of the illustrations are correct, and which erroneous? Please mark the figures.

A. The figures are substantially correct as illustrations. Figures eight and nine are copied from the Scientific American's articles. Figures 1, 2, 3, 4, 5 and 6 seem to be taken from patents or caveats. Figure 7, I do not know how that was obtained. It is substantially correct, but not correct in detail.

296 X Q. State, if you know, who is the author of the article.

A. I believe a reporter of the New York Herald, named Edwin Fox, was the author.

297 X Q. What part of the article is true, and what part romance?

A. That which is descriptive of the apparatus is substantially correct. The rest is an ingenious weaving in of the experiments and talk at the laboratory, and imagination of the reporter, into a separate article, in a proper form to appeal to the imagination.

298 X Q. Within a few days after the publication of that article, do you recollect of telling any one, that it was true every word of it, or something to that effect?

3116 A. No, sir; I don't recollect of telling any one that it was true every word of it. I might have been asked by a number of people if that Herald article was correct, and might have replied that it was correct, meaning that the results I had attained had been attained.

299 X Q. What degree of vacuum is it necessary to maintain in the chamber of your lamp to make the carbon endure in a state of incandescence for one hour, so as to produce a luminosity equal to 15 candles?

A. Never having tried that exact experiment I cannot state.

300 X Q. What degree of vacuum would be necessary to be maintained to ensure the endurance of the carbon in a state of incandescence equal to a luminosity of 15 candles for two hours?

A. Never having tried that exact experiment I cannot say.

301 X Q. Same question, during a period of three hours, or four hours, or five hours, or any number of hours of which you have actual knowledge, as to the endurance of the carbon illuminated to the degree of incandescence mentioned in my question No. 299?

A. I cannot give exact results, but my impression is from noticing lamps having poor vacuums, and lamps on the pump where there was a g*ua*ge, that generally the carbon would not last at that incandescence more than four or five hours when the barometrical mercury column showed a vacuum of only about a millimeter. This has reference to my lamp, when it is to be worked in vacuum.

302 X Q. Does the invention described in your application for a patent in this interference include a vacuum in the illuminating chamber of the lamp?

Question is objected to upon the ground that as the application itself is in testimony, it is the best evidence.

A. The application itself is the best evidence of that.

3117 302 X Q. What does the application say upon the subject?

Same objection as before.

A. Being in evidence it can be referred to, to ascertain what it says.

304 X Q. I have no complete copy of the application, nor has any been put in evidence; please to read from the specification, if you have one, what is said upon that subject.

Question objected to for the reason that the application by the rules of the Patent Office is a part of the record testimony, and counsel for Sawyer and Man is entitled to a copy at any time by asking for it at the Patent Office and paying for it.

Counsel for Sawyer and Man states that counsel for Mr. Edison prompts the witness by putting a copy of the specification in his hands and telling the witness to say that he would very cheerfully read the specification if he had a copy of it, but does not know whether his copy is a correct copy, his copy being the retained papers or roughs of the specification, in which many alterations seem to have been made.

A. I have no specification which I am sure is a correct one.

304 X Q. Do you know whether the carbonized-paper burner, making the subject-matter of this interference, is intended to be illuminated in vacuum?

A. That is one of the intentions according to my recollection.

306 X Q. Do you know whether the carbonized burner making the subject-matter of this interference is intended to be illuminated in a glass chamber from whence the air has been exhausted, and an inert gas substituted in the chamber? 3118

A. It was intended mainly to be worked in vacuum but I also intended and did try some of these paper-carbon loops in a sealed glass receiver containing an inert gas, or intended to be inert.

307 X Q. How long did the paper-carbon loops, tried in inert gas, endure when they were illuminated?

Question objected to as not being proper cross-examination.

A. I do not remember.

308 X Q. State as nearly as you recollect?

A. The ones I saw, I think, lasted five minutes; and perhaps, one of them lasted an hour, or even two hours.

309 X Q. Did you make the experiments yourself?

A. No, sir.

310 X Q. Who made them?

A. I think one of the parties was named Francis Jehl.

311 X Q. Where were they made?

A. At my laboratory at Menlo Park?

312 X Q. When were they made?

A. My impression is they were made either in December, 1879, or January, 1880.

313 X Q. What gas was used in the chamber?

A. I did not analyze it.

314 X Q. Don't you know?

A. I know what we intended to use.

315 X Q. What did you intend to use?

A. Hydrocarbon gas, hydrogen gas, nitrogen gas, hydrochloric acid gas and chlorine gas, I think.

316 X Q. How many experiments did you make?

A. I saw two or three.

317 X Q. What kind of gas was the chambers filled with in the experiments that you saw?

A. I didn't analyze it.

318 X Q. Don't you know?

3119 A. I would not absolutely know without analyzing it.

319 X Q. Do you know that was intended to be used?

A. I have already testified that gases were intended to be used, but cannot be certain as to which gas was used in the experiments I saw.

320 X Q. Do you know whether any of these gases were used in a state of purity in charging the illuminating chamber of the lamp?

A. I don't know that they were pure.

321 X Q. Do you know at what pressure the gas was put in the chambers of the lamps?

A. My impression is at atmos-heric pressure.

322 X Q. Have you made or caused to be made any other experiments in illuminating by incandescence with paper carbon in a sealed lamp filled with inert gas, than those you have referred to in the immediate preceding answers?

A. Yes, sir; I have made them with a gas which is supposed to be inert.

323 X Q. When were these other experiments made?

A. While not intended, the lamp Exhibit Edison's First Incandescent Lamp did have a gas in it formed by the decomposition of the grease used in the lamps at the joints, as I have already stated in my evidence, and at times, since January, 1880, lamps have been made in which simple and compound gases have been used, experimentally, to determine theoretical points. I have also used in the early part of 1879, perhaps in December, 1878, gases, especially hydrogen, in a lamp giving light by incandescence, but in this case platinum was used.

424 X Q. Does electric lighting by incandescence with carbon in sealed lamps charged with inert gas, make any part of the invention described in your application for a patent in this interference, or intended to be described in that application, or does it make any part of your system of electric lighting by incandescence?

3120 Counsel for Mr. Edison objects to all that portion of the question which relates to the specification, on the ground that the specification itself is the best evidence.

A. The specification itself will be the best answer that I can give to the question, and I do not desire to state what I intend or what I do not intend to use in my system of electric lighting.

325 X Q. Has electric lighting by incandescence with carbon in sealed lamps charged with inert gas, heretofore made any part of your system of electric lighting by incandescence?

A. I have already testified that I have tried the same and as I had a system of electric lighting at Menlo Park at the time, these formed a part of the system at that time.

326 X Q. Do you mean to swear that you have used at Menlo Park a system of electric lighting by incandescence, in which carbon was used as the illuminating portion of the lamp, in an atmosphere of inert gas in a sealed lamp?

A. Yes, sir; such lamp formed part of a system of lighting by incandescence of carbon at Menlo Park.

327 X Q. When?

A. In December, 1879, or in January, 1880, I think.

328 X Q. What kind of carbon did you use?

A. Carbon made out of paper.

329 X Q. How long did you use that system?

A. The system is still there.

330 X Q. How many lamps did you use of the kind I have described in my question No. 326?

A. We have used on that system at Menlo Park, I should say, as many as thirty lamps, but as to the inertness of the gas on the carbon, I am not sure as any gas whatsoever has an effect on the carbon.

331 X Q. How many sealed lamps have you used that were charged with gas that was intended to be inert, and the illuminating part of which was made of carbonized paper?

A. I have already testified that no gas is inert, and there-
3121 fore I could have made no lamps in which it was inert.

332 X Q. Question repeated.

A. No lamps that were inert because I knew that no gas could be used that was inert, all gases having effect on the carbon.

Answer objected to as irresponsive.

333 X Q. Question repeated.

A. I have already testified to that question.

334 X Q. How many sealed lamps have you used that was charged with gas commonly called inert, and the illuminating part of which was made of carbonized paper?

A. My impression is that a half a dozen were made.

335 X Q. How long did you continue to use them?

A. I did not see more than two or three, and those didn't last more than from fifteen minutes to an hour.

336 X Q. State, if you please, whether the Exhibit Edison's First Incandescent Lamp is the apparatus referred to in answer 9 of your examination-in-chief.

A. Yes, sir.

337 X Q. What experiments have you made in treating carbons for electric lighting, made of paper, electrically in a hydrocarbon gas?

A. The experiment with the first incandescene lamp might be considered an experiment with a hydrocarbon gas; I have tried other experiments in treating paper with an atmosphere of hydrocarbon gas since that time.

338 X Q. Please to relate what experience you have had in treating carbon electrically in a hydrocarbon gas, for the purpose of enlarging or purifying the carbon, or consolidating it?

Question objected to as a cross-examination upon matters not involved in this interference, and involved in another interference to which Sawyer and Man are not parties.

3122 Counsel for Sawyer — Man says that the witness in his examination-in-chief has expressed opinions about the utility and practicability of treating carbons in that way, and that the question is pertinent to matters testified to by the witness in his examination-in-chief.

A. I have brought up to incandescence a carbon within a lamp containing a hydrocarbon; I have *node* it in a great number of lamps, a hundred or more; I have tested the economy, the conductivity and other properties of the carbon, and have examined the same many times under a powerful microscope.

339 X Q. When did you make the experiments?

A. They were made previous to the declaration of this interference; a hydrocarbon gas was used, I think, in December, 1879 and '80, but not for the purpose set forth in your question.

The taking of further testimony was adjourned by consent to Saturday, June 18, 1881, at 10 o'clock, at same place.

WM. H. MEADOWCROFT,
Notary Public, N. Y. Co.

Pursuant to adjournment, this examination was continued June 18, 1881, at 65 Fifth avenue, New York, same counsel being present.

340 X Q. Have you had any experience in treating carbon for illuminating purposes in electric lamps, electrically in the presence of hydrocarbon gas or fluid, previous to putting them in the sealed illuminating chamber of the lamp?

Question objected to as improper cross-examination, no inquiry having been made about the same in the examination-in-chief.

3123 A. Yes, sir.

341 X Q. Please to relate what experience you have had in treating carbons in that way, and give the dates of your experiments.

A. I have no memorandum with me which would refresh my memory as to the dates, but it was previous to the declaration of this interference that I tried experiments of heating to incandescence a carbon conductor in a hydrocarbon gas within a fluid, and also heating a carbon conductor to incandescence by an electric current in a gas within a chamber not sealed.

342 X Q. How many carbon burners have you treated in that way?

A. I should say twenty or thirty.

343 X Q. When did you do it? State as nearly as you can recollect.

A. Some time between March and September, 1880.

344 X Q. Is that as near as you can give the date?

A. Yes, sir, as I have no memoranda here, not thinking that this question would come up.

345 X Q. Please to describe your method of treating these carbons in hydrocarbon gas electrically, including the apparatus you used in your experiments.

Same objection as before was repeated.

A. As the details of the mechanism which I used is the subject-matter of another interference, I refuse to answer.

Counsel for Sawyer and Man insists upon a responsive answer to this question, and gives notice that unless the witness answer the question he will move to strike out the deposition.

346 X Q. Question repeated.

A. I have already described them sufficiently. I stated that the carbon was brought to incandescence by electricity when within a gas within a liquid, and also when within a gas within a chamber not sealed.

3124 347 X Q. What kind of a chamber was it, and how was the carbon conductor arranged in the chamber, and what kind of hydrocarbon fluid and gas did you use?

A. It was a glass chamber, the carbon was within the chamber arranged so that the electricity would pass through it, and gasoline was used.

348 X Q. How did the treatment affect the carbon treated?

A. It brought its resistance down and deposited a crust of hard carbon over its surface which under the microscope showed a multitude of projecting points which were found to be hollow when broken.

349 X Q. Of what material was the carbon made that you treated?

A. Both paper and bamboo.

350 X Q. After you had treated the carbon did you put it in the sealed chamber of an electric lamp and raise it to incandescence, and if so, with what result?

A. Yes, sir; some of them we did. The result was that it was lower resistance and seemed to be more susceptible to destruction by electrical carrying than the untreated carbons.

351 X Q. To what degree of luminosity did you raise it?

A. Varying degrees of luminosity.

352 X Q. Please to name them.

A. I think as high as a hundred candles.

353 X Q. How long did the carbon burner last raised to the luminosity of a hundred candles?

A. My impression is that it lasted about two hours. It was a very fine filament.

354 X Q. Please to give its dimensions.

A. I cannot give its dimensions. We had carbons of various dimensions. These were tried on very fine filaments. It was a thinner one than that shown in the Exhibit "Edison's Commercial Incandescent Electric Lamp." It was a little longer. I should say it was a quarter of an inch longer. I am referring to
3125 the one that lasted two hours yielding a hundred candle power.

355 X Q. Was it in vacuum?

A. Yes, in very high vacuum.

356 X Q. Does the successful use of the lamp described and illustrated in the application for the patent involved in this interference necessitate a high vacuum in the illuminating chamber?

A. In a commercial sense it is my opinion, which results from my experiments, that it is essential to have a high vacuum in the lamp chamber, for the reasons I have heretofore stated.

357 X Q. Are you now manufacturing incandescent electric lamps substantially like that described and illustrated in the application for the patent involved in this interference, commercially?

A. The electric lamp company, with which I am connected, are manufacturing lamps of this kind and selling them to electric light companies.

358 X Q. What company do you refer to as that with which you are connected, that is manufacturing these lamps commercially?

A. The Edison Electric Light Company.

359 X Q. What proportion of the lamps so manufactured by the Edison Electric Light Company are fitted with carbon burners made of paper?

A. From one and a half to two per cent., I should say. I have not looked over their books lately. I know that a man is now engaged, and has been at different times in the last three months, in making paper carbons for use at the lamp factory.

360 X Q. Are the carbon burners with which these lamps are fitted made upon the plan described in the application for the patent involved in this interference?

A. Yes.

361 X Q. Please to give the dimensions of these carbon burners.

3126 A. I should say they were about an eighth of an inch, perhaps a quarter of an inch, shorter than the one shown in the Exhibit Edison's Commercial Incandescent Lamp.

362 X Q. How does it compare in diameter to the burner referred to in your last answer?

A. I should judge that it was a shade wider, but have no idea as to how thick it is.

363 X Q. What, no idea as to how thick it is?

A. If it was a foot thick, I think I should probably have an idea; but as these filaments are always made out of thin paper, I cannot state whether it is thicker or thinner than the one in Edison's commercial incandescent lamp.

364 X Q. Please to give, as nearly as you can, the dimensions of the carbon burner in Edison's commercial incandescent electric lamp.

A. I guess it is about an inch and a quarter from the top of the clamps to the top of the loop; about seven-eight-s of an inch from one side of the loop to the other. I should judge that the width was twenty-thousandths of an inch, and five-thousandths of an inch thick.

365 X Q. To what degree of luminosity are these lamps which you say the Edison Lamp Company are manufacturing commercially, fitted with carbonized-paper burners, brought or intended to be brought in practical use?

A. Sixteen candles, I believe.

366 X Q. How do you measure the candle power of a burner?

A. With a photometer.

367 X Q. What photometer do you use to measure your candle power?

A. The Bunsen spot photometer.

368 X Q. Referring again to the Exhibit Edison's Commercial Incandescent Electric Lamp, please to state, as near as you can, what

its luminosity was during the time of its burning, as noted
3127 in the record about which you have heretofore testified, and
of which you have given a transcript of, page 39.

A. My impression is that the average candle power would be about from twelve to sixteen candles.

369 X Q. You say that about one or one and a half per cent. of the lamps that are manufactured by the Edison Electric Lamp Company are fitted with carbonized-paper burners. Please to state what is the whole number of lamps manufactured by that company per day.

A. About a thousand per day.

370 X Q. Have you ever made any carbons from several thicknesses of blotting paper, pressed together under a hydraulic press?

A. I have made carbons of several thicknesses of blotting paper pressed together under a screw-press, but not under a hydraulic press.

371 X Q. Where is the Edison Electric Lamp Company situated—I mean its factory?

A. At Menlo Park and at Newark.

372 X Q. Does that company sell lamps to any one who may wish to purchase them?

A. Yes, in foreign countries and in this country, by the permission of another company—the Edison Electric Light Company.

373 X Q. Does that company treat the carbon burners of their lamps electrically in the presence of hydrocarbon gas before they use them for illumination—I mean the Edison Electric Lamp Company?

A. Not lately.

Cross-examination ended.

Counsel for Edison, in pursuance with the notice given at the close of his examination-in-chief, puts in evidence letters patent of Thomas A. Edison, No. 224,329, dated Feb. 10, 1880; 227,227, dated May 4, 1880; 227,228, dated May 4, 1880; 227,229, dated May 4, 1880;
223,898, dated January 27, 1880; also specification of English
3128 patent of Thomas A. Edison, No. 2402, June 17, 1879, also
letters patent 205,144 of Sawyer and Man, dated June 18, 1878; 210,152 of Sawyer and Man, dated November 19, 1878; 210,809, of Sawyer and Man, dated December 10, 1878; 219,771 of Wm. E. Sawyer, dated September 16, 1879; 211,262 of Sawyer and Man, dated January 7, 1879; 229,335 of Sawyer and Man, dated June 29, 1880; 227,118 of Albon Man, dated May 4, 1880.

It is stipulated between counsel for Edison and Sawyer and Man, that the Government-printed copies of these patents may be read in evidence with the same force and effect as if they were certified copies put in evidence and marked as exhibits in the case, counsel for Edison agreeing to furnish counsel for Sawyer and Man, with at least three of each of such printed copies; and it is further stipulated that the said Government-printed copies of all the patents — put in and referred to as evidence on behalf of Sawyer and Man, with like effect, counsel for Sawyer and Man agreeing to furnish counsel for Edison, with at least three of such printed copies. Said patents to be subject to all legal objections, nevertheless, that might be taken or urged against them if they were regularly put in evidence as exhibits; and counsel for Sawyer and Man objects to the above-mentioned patents as evidence in this case, on the ground that they are not pertinent or relevant or competent as evidence upon any issue in this controversy, and request counsel for Edison to state upon the record how such patents are competent, relevant, or material upon any issue in this controversy.

3129 Counsel for Edison replies that when the matter comes up for hearing an attempt will be made to show that such evidence is material.

Re-examination of the witness by GEORGE W. DYER, of counsel for Edison:

371 Q. Referring to your answers on cross-examination, as to your experience in making and using carbons of paper in 1876 and 1877, did anything remain to be done by you prior to 1878, to determine the qualities essential in the paper carbon for an incandescent conductor for an electric lamp?

Question is objected to upon the ground that it does not appear by any of the witness' answers on cross-examination that he made any carbons of paper in 1876 and 1877, for electric lamps, nor does it appear from anything the witness has said, either upon his examination-in-chief or his cross-examination, that he successfully used carbonized paper for electric lighting by incandescence previous to the fall of 1879, and upon the further ground that all of the witness' testimony intended to prove or going to prove that he made the invention, or any part of it, previous to the date alleged in his preliminary statement, is inadmissable under the rules of the Patent Office and its well-established practice; and upon the further ground that the question is intended to bring out matter upon which the witness was previously examined in chief, and not upon anything new brought out in cross-examination.

A. No, sir.

3130 & 3131 372 Q. Referring now to your answers upon cross-examination, when did you first determine the sufficiency of carbonized paper, *per se*, for an incandescent conductor for an electric lamp?

Question objected to because it is indefinite as not referring to any particular answer to any question on cross-examination; and upon the further ground that the question is not when he first determined the sufficiency of the carbonized-paper burner, but when he first proved its sufficiency by actual use; and upon the further ground that the question refers to experiments made before the time given in the preliminary statement.

A. I knew from my experiments in 1876 and 1877, where I employed carbonized paper and other carbonized organic substances for resistances, that carbon in that state of aggregation had high resistance as compared to hard or coke carbon, and was the proper form to use for incandescent conductors for electric lamps, if they were to be worked in multiple arc, and the experiment with the strip of carbon in the open air, and in the Exhibit Edison's First Incandescent Electric Lamp, used in 1877, also showed its adaptability and sufficiency for multiple-arc lighting.

373 Q. In 1877, did you require any further information or experiments to determine the sufficiency of incandescent conductors for electric lamps made with carbonized paper?

Question objected to as referring to a date previous to the date of the preliminary statement, and also as not bearing upon the question of when witness did make the invention in the interference by its actual and successful use, and on the further ground that the witness has already been examined in chief on that very point.

A. No, sir.

3132 374 Q. Referring again to your answer upon cross-examination, wherein you stated that since your experiments in electric lights had been resumed in 1878, you had been working upon the same day and night, please give in a general way the nature of your labors in electric lights up to 1880, and the assistants employed by you and the general nature of their duties.

A. In the fall of 1877, having about finished my labors with my carbon telephone, I had several ideas which I desired to work up, one of them being the subdivision of the electric light, hence, I commenced experimenting for that purpose, as my testimony and exhibits show. These experiments continued, I think, until January, 1878, when my time and attention was absorbed by the excitement caused by the invention and exhibition of the phonograph. This continued until July, when my health being broken down by several years of continuous labor, I went to California and other places West, spending about two months. On my return, in August, 1878, I immediately took up the experiments made in 1877, but interrupted by the phonograph and the state of my health, and have continued them night and day ever since. About December, 1878, I engaged a mathematician named Mr. Upton, to assist me in working out the complicated problems as to economy and adaptability of the various devices necessary to make a complete system of electric light by incandescence, which would be capable of replacing or competing with gas, over large areas, such a system comprising main conductors, house conductors, lamps of various characters, meters, dynamos, electro-motors of various kinds and characters, apparatus for regulating the pressure of the flow of electricity through such system, arrangement of the system of conductors for equal distribution of the electricity, safety devices, boilers, steam-engines, electro-meters, photometers and other appliances. I had other assistants, among whom may be mentioned Francis Jehl, John Kruesi, Charles Clarke, Charles Batchelor, William Hammer, Mr. Herrick, Dr. Haid, Mr. Lawson, Martin Force, Dr. Moses,
3133 E. H. Johnson and many others who were employed in 1878

and 1879. Possibly Clarke and Hammer may have started work in the early part of 1880.

Answer objected to, as to all work and experiments made before the date given in the preliminary statement, in so far as such relates to the issue in controversy.

Postponed until Monday, June 27th, 1881, at 10 a. m., at 65 Fifth avenue, N. Y , by consent.

WM. H. MEADOWCROFT,
Notary Public, N. Y. Co.

3134

Edison Exhibit No. 3.

(Book No. 67. Pages 1 to 15, inclusive.)

Record of Lamps.

No. 142. Resistance, 150 ohms. } 1880. Jan. 2.
Has burnt at least 200 hours. } 12 noon.

This lamp is hung on the two main wires over the pumps.

3145 Edison's Exhibit No. 7.

Extract from Records of Experiments, Book No. 85.

"All pumps give a great deal of trouble at F where a contraction is made so that the air in G may be forced out from H.

B. This stop-cock placed too far from the main reservoir so that the tube near it caught air. This could be worked out by letting the Hg work up and down. The MacLleod should not be used until a high vacuum has been attained. For if this has not been done the Hg sticks in the side tube. Last evening a vacuum was obtained so that the spark jumped five inches outside of the tube rather than across ¼ inch in vacuum. The changes in vacuum were extremely rapid from green to preventing a small spark in a few seconds and then in a few minutes to stopping the large spark. The finely divided copper and sulphuric acid may have had a strong influence on this F, the tube contracted here so that a pressure can be obtained in G to drive the air out through the stopcock H.

The enlargement of the tubes at L and L^1 is a mistake, as a bubble of air collects here and is drawn up into the pump. Making stop-cock D with tube to left inclined upwards may be a mistake, as the Hg collects above the cock and stops the Geissler. Pure black rubber tube placed inside of white rubber to prevent soiling Hg.

3146 Edison's Exhibit No. 8.

(New York Sun, December 22d, 1879.)

Electrician Sawyer's Challenge to Electrician Edison.

If a party possesses an interest in something that he considers valuable, he is not very likely to part with it, especially if it be something in the line of electric lighting, where what may nominally be $1 may really be $1,000. Therefore, when Mr. Edison sells out all his interest in his electric light there is a reasonable chance for a suspicion that he considers his invention worth very little.

Mr. Edison's reputation before the public is founded upon the newspaper publications about: 1. The quadruplex telegraph; 2. The telephone; and 3. The phonograph.

As to the quadruple telegraph, I may say that it was an adaptation of the French and German systems. When Mr. Edison took hold of the 4-plex, there were already known five systems of 2-plex, three of 4-plex, and three of 6-plex and 8-plex.

The 4-plex of Edison was a failure. A modest young gentleman, assistant electrician of the Western Union Telegraph Company, whom I have not seen for several years (Mr. Gerritt Smith), made it a success, and some day he will get the credit for this invention; for he, and not Edison, is the genius in this case.

As to the telephone, Mr. Edison is not the inventor. Andrew Graham Bell is the inventor of the telephone.

As to the phonograph, which really made Mr. Edison's reputation, it is of no earthly value, and the manufacture by Bergman has practically been dropped. The real inventor of the phonograph will never be known, in all probability, for I understand that Mr. Edison anticipates a Western man but three days in priority of invention.

3147 Now, all that remains for Mr. Edison is electric light. He is going over the same ground that Bouliguine, Lodygreine, Kosloff, Koun, Starr, King, myself and others have traversed—first, iron; second, platinum; third, carbon in different shapes. And Edison has failed, in my opinion. To show that I mean what I say, I deny every one of his allegations made at the Saratoga convention of the American Society for the Advancement of Science, and, specifically, I challenge him:

First. To maintain a vacuum in his lamps.

Second. To run his carbonized-paper lamp three hours. (In practice, in a perfect vacuum, it will last twenty minutes.)

Third. To consolidate platinum by heating electrically in the Sprengel vacuum, as he claims.

Fourth. To prove that his dynamo-electric machine develops not ninety, but even forty-five per cent. of the feet pounds applied to it.

Fifth. To show that he can obtain a light of twenty-five candles from platinum with less than three horse power.

Sixth. To show that platinum or iridium will not disintegrate in twenty hours' actual running.

Seventh. To prove that with this carbonized-paper lamp he can obtain two lights of ten candles each per horse power.

Eighth. To show that the effect of the oxide of magnesium is to harden his wire, and make it more refractory.

And I further allege that all Mr. Edison's statements are erroneous, and I offer $100 as a prize for him to prove each of the above eight allegations. Let him run one of his lamps three hours and the public will be satisfied that I am correct.

W. E. SAWYER.

78 Walker street, New York, Dec. 21.

3148 Pursuant to adjournment this testimony was continued June 27, 1881, at 10 a. m., at No. 65 Fifth avenue, New York city, same counsel being present.

Martin N. Force, a witness produced in behalf of Mr. Edison, being duly sworn, testified as follows in answer to questions proposed to him by George W. Dyer, counsel for Edison:

1 Q. What is your residence and occupation; by whom are you employed, and how long have you been so employed?

A. My residence is Menlo Park, N. J.; my occupation is assisting Mr. Edison in his experiments; I have been so employed since about 1875.

2 Q. What sort of work did you first do for Mr. Edison?

A. I did carpenter work.

3 Q. If you did any particular carpenter work for him in relation to the laboratory, please state what it was and when it was done?

A. I helped to erect the laboratory, putting up shelves in the same, and I did carpenter work at his pen factory; about in the fall of '75 and the spring of '76.

4. If at any time you changed the nature of your work for Mr. Edison, what new work did you enter upon, and when did you do so?

A. I was at the pen factory packing the pens, and some of the time I ran the engine. Then I went in the laboratory to assist in the laboratory, about the spring of '78. My duties were anything I was asked to do; assisting at making and charging batteries, cleaning the laboratory, and such work. And since that time my work has been general in the laboratory, assisting wherever I was called upon.

3149 5 Q. Please examine the paper now shown you, marked Edison's Exhibit No. 5. State whether the signature M. N. Force upon the same is your signature and when was the same made?

Question objected to as going to show that the invention in question was made before the date alleged in the preliminary statement of Mr. Edison.

A. I have examined the paper; the signature is mine. It was made at the date of this paper, December 3d, 1877.

6 Q. Please look at exhibit marked Edison's First Incandescent Lamp, and state whether you have seen the same before, and if so, when and where?

Same objection as to previous question.

A. I have looked at the instrument. I have seen it in the laboratory at Menlo Park. I have seen the instrument setting on the shelf at the upper part of the laboratory. I should say it was about three years ago, as near as I can remember.

7 Q. Have you assisted at any experiments in electric lighting with incandescent paper carbons or witnessed such experiments at Menlo Park; if so, state the earliest times of the same?

A. I assisted Mr. Batchelor about September or October, 1878, I don't exactly know which, to make some carbons. The carbons were rolled with a sort of coating of tar, and carbonized in a crucible filled with charcoal or something of that description, and also carbonized in a combustion tube. As near as I can remember at that time they were put in the bell jar of a vacuum pump. The air was then exhausted, and an electric current passed through the carbon.

7½ Q. Please examine the paper now shown you marked Edison

Exhibit No. 9. State whether or not sketches on that paper represent the bell jar employed in the experiments you have related.

3150 A. I have examined the Exhibit No. 9 and find it to be, as near as I can remember, a drawing of the vacuum pump which we used at that time.

Counsel for Edison gives notice that he here closes his examination-in-chief of this witness, and gives him over for cross-exami-tion.

Cross-examination by Amos Broadnax, Esq., counsel for Sawyer and Man:

Counsel for Sawyer and Man gives notice that his cross-examination is not intended to waive any objection taken to the testimony.

8 X Q. Did you sign your name on this paper, Edison Exhibit No. 5, in presence of Mr. Edison and Mr. Batchelor?

A. Yes, sir.

9 X Q. Where were they?

A. In the laboratory at Menlo Park.

10 X Q. Was it in the morning or in the evening?

A. In the evening.

11 X Q. Was it by gas light or by daylight?

A. I don't exactly remember whether it was by gas light or by daylight.

12 X Q. What was the object of making that paper?

A. As a record. I suppose, of the experiment.

13 X Q. What experiment?

A. The experiment shown on the paper.

14 X Q. In whose handwriting is this paper?

A. It looks like Mr. Edison's handwriting somewhat.

15 X Q. Did you see him write it?

A. I do not remember seeing him write it.

16 X Q. Can you swear that that is his handwriting?

A. No, sir; I wouldn't swear that it's his handwriting.

17 X Q. Can you swear that that paper was written December 3d, 1877?

3151 A. No, sir; I wouldn't swear that it was written at that date, of course.

18 X Q. Can you swear that you signed your name on it December 3d, 1877?

A. I can swear that that's my signature.

19 X Q. Can you swear that you made this signature on December 3d, 1877?

A. I made that signature at that time; yes, sir.

20 X Q. How do you fix the date of the making of that signature on that paper?

A. I have no particular way of fixing the date, but generally at the time an experiment is tried, we always sign, and I never sign unless I see the experiment.

21 X Q. Did you witness the experiment referred to on that paper?

A. Yes, sir; I was there at the time, but I don't know the details of the experiment.

22 X Q. What was intended to be proved by the experiment?

A. I couldn't say what he intended to prove.

23 X Q. What did the experiment consist of? What did he do?

A. I don't remember. I can't give the details of the experiment.

24 X Q. How do you know that the experiment referred to on that paper was made on or about December 3d, 1877? What circumstance can you mention that was contemporaneous with that experiment?

A. I do not know that I have anything particular to call the same to my mind. I used to frequent the laboratory to see them experiments, but did not enter into the details of the experimenting. There is no particular circumstance that I recall to my mind.

25 X Q. Did you see Mr. Edison make any experiments with the Exhibit Edison's First Incandescent Lamp?

A. No, sir; I don't remember seeing any.

26 X Q. You say you assisted Mr. Batchelor to make some carbons out of paper coated with tar. Did you mean to be un-
3152 derstood as saying that the carbon you assisted Mr. Batchelor
to make was in the form of a knitting needle?

A. The carbons that I assisted Mr. Batchelor to make were rolled by the hand, coated with tar, and in the form of a small cylinder.

27 X Q. How big were they?

A. They were different sizes. They may have been the size of a quill, or the size of a finger, or smaller.

28 X Q. How much smaller were they? Were any of them as small as an eighth of an inch in diameter?

A. I don't just remember the sizes, and couldn't say as to that. We didn't care particularly as to the size.

29 X Q. Can you state how long they were?

A. They may have been an inch, or two inches, or three inches.

30 X. Q. How many of them did you make?

A. I would not say as to the number. There may have been ten, or there may have been fifty.

31 X Q. Did you see any of these carbons put in the vacuum chamber of the pump represented by Edison Exhibit No. 9?

A. Yes, sir; I think I saw those put in.

32 X Q. Are you sure you saw those carbons put in that chamber?

A. Yes, sir; in a chamber similar to this drawing.

33 X Q. How many did you see put in?

A. I don't just remember the number. I think there were more than one.

33½ X Q. Can you swear that there was more than two put in?

A. I wouldn't swear that there were more than two; there may have been. My memory don't serve me as to that point.

34 X Q. Was you present during the whole of the experiment?

A. I was present with Mr. Batchelor at the carbonizing and at the vacuum pump. I wouldn't say that I was always at that place, but I was usually present.

3153 35 X Q. Did you work the vacuum pump?

A. Yes, sir; I used to do the pumping most of the time.

36 X Q. Did you see those carbons illuminated by the electric current in the vacuum chamber of the pump?

A. Yes, sir; I remember of seeing them lighted.

37 X Q. Did you see more than one of them lighted?

A. I don't say as to the number I have seen lit, but I remember seeing the carbons illuminated in that chamber.

38 X Q. Was there more than one pump in the vacuum chamber of which you saw these carbons placed and illuminated?

A. No, sir; there was only the one pump at that time.

39 X Q. Was there more than one carbon in the chamber at any one time?

A. I don't remember more than one at a time, but there may have been more.

40 X Q. Did the experiments last more than one day?

A. I would not say as to that; I don't remember how many days.

41 X Q. Who was present during these experiments beside yourself and Mr. Bachelor?

A. I think Mr. Edison was present; I don't call to mind any others.

42 X Q. Were the experiments continued more than two days?

A. I don't remember how many days; it may have been one or two, or perhaps a week.

43 X Q. Can you swear that these experiments continued for more than two days in the fall of 1878?

A. I would not swear that they were continued more than two days, although they may have been.

44 X Q. Can you swear that they were continued for two days?

3154 A. I think, as near as I can remember, they were continued for that length of time.

45 X Q. When the carbons were illuminated by the electric current, how long did they last?

A. I would not say as to how long they lasted exactly.

46 X Q. Well, about how long?

A. As near as I can remember, they lasted probably a minute, or a couple of minutes, or five minutes.

47 X Q. These paper carbons about which you have been testifying, are they the first which you saw made at Menlo Park by Mr. Edison and Mr. Batchelor?

A. As near as I can remember, they were about the first.

48 X Q. And you are certain that that was in the fall of 1878?

A. Yes, sir; it was in September or October of 1878, to the best of my recollection?

MARTIN N. FORCE.

3155 EDWARD H. JOHNSON, a witness produced in behalf of Mr. Edison, being duly sworn, testified as follows in answer to questions proposed by GEORGE W. DYER, counsel for Edison:

1 Q. State your residence and occupation, and whether or not you

are one of the assistants of Mr. Edison, and if so, how long you have been with him in that capacity?

A. I reside in New York city; my occupation is that of a practical electrical engineer; I have been engaged for the past ten years in practically applying Mr. Edison's inventions in telegraphy, telephony, and now in the electric light, and in such capacity I have been his assistant, not directly employed in his laboratory until September last, but always with the parties who were putting Mr. Edison's inventions on the market; my relations with him and his work were such that I was a very frequent visitor at his laboratory.

2 Q. What, if anything, do you know of the experiments of Mr. Edison in the summer of 1876, in the carbonization of paper for various purposes?

Question objected to in so far as it applies to electric lighting, if it is intended to show that Mr. Edison carbonized paper for that purpose in 1876.

A. In the fall or winter of 1876, I sought to organize a small business for myself under the name of the American Novelty Company, the object of which was to acquire numerous inventions of Mr. Edison, Mr. Batchelor, Mr. Adams, my own, and others; and to put them upon the market. Several such were acquired, namely, Edison's duplicating ink, Edison's battery carbons, Edison's jeweller's engraving machines and others which I cannot now recall. The attempt to form a company to carry on such a business was practically a failure, owing to the lack of funds. I remember, in discussing with Mr. Edison at his laboratory, quite prominent mention was made of numerous articles, which he, Mr. 3156 Edison, was intending to manufacture of carbon. I cannot now recall all of them in detail, but they were such articles as dishes, small vessels, resistance coils, battery carbons, etc. I remember, on frequent occasions, seeing Mr. Edison carbonizing certain of these articles under pressure, that being the particular feature of the invention. In discussing the matter with Mr. Edison, Mr. Batchelor and Mr. Adams, they informed me that they purposed making such carbons of bituminous coal, paper and wood. My knowledge of the experiments was necessarily confined to information given me at the time by these gentlemen, as I was so occupied in New York that my visits to the laboratory were mainly for the purpose and with the object of consulting with Mr. Edison, and not in assisting him in his experimental work.

3 Q. At what date do you know, of your own knowledge, of Mr. Edison engaging in experiments in the electric lights, with incandescent conductors made of paper carbon?

A. I fail to recall now the exact date when I first saw Mr. Edison's paper-carbon experiments.

4 Q. When was your first knowledge of Mr. Edison's experiments in electric lights?

A. In the summer of 1878, on his return from the Colorado scientific expedition, which he had accompanied for the purpose of endeavoring to measure the heat of the corona during the sun's eclipse, with the tasimeter which he had invented. It is from this date that my recollection runs freely as to Mr. Edison's electric light work. Prior to that, anything that he did did not sufficiently attract my attention to fix either the date or the experiment on my mind.

5 Q. Since the summer of 1878, what has been your knowledge with regard to persistent and continuous work on the part of Mr. Edison in incandescent electrical lights?

3157 A. That Mr. Edison pursued experimentation in this direction uninterruptedly night and day, from that date to this, with his customary energy and persistence, when fully started in a given direction for a given object.

6 Q. What is the earliest date within your recollection of the employment of paper-carbon conductors for incandescent electric lights by Mr. Edison?

A. I have a not well-defined recollection of witnessing certain experiments with paper carbons for this purpose in the winter of 1878–'79. In the summer of '79 I went to Europe, and saw nothing more of Mr. Edison's experiments until January, 1880, when I visited Mr. Edison's laboratory upon a mission from England, and there saw a large number of paper-carbon lamps, in actual operation. I returned to England within a fortnight, taking six of the paper-carbon lamps with me, and did not again visit the laboratory until September 1st, 1880.

Counsel for Edison closes the examination-in-chief of this witness and offers him for cross-examination.

Cross-examination by AMOS BROADNAX, counsel for Sawyer and Man:

7 X Q. Please state your name and age, Mr. Johnson.

A. My name is Edward H. Johnson, and my age is 35 years.

8 X Q. Please to fix the date exactly when Mr. Edison returned from the scientific expedition organized to observe the sun's eclipse.

A. I can't fix that date from memory.

9 X Q. Have you any memoranda to which you can refer, by which you can fix the date?

A. Not to my knowledge. I do not make it a rule to preserve memoranda or papers of any description.

3158 10 X Q. You say, in answer to Q. 4 of your examination-in-chief, that the first knowledge you had of Mr. Edison's experiments in electric lights was in the summer of 1878, after his return from the scientific expedition to which I have referred. Please to state whether you derived that knowledge from others, or whether you witnessed those experiments yourself.

A. I witnessed numerous experiments myself.

11 X Q. These experiments that you say you witnessed yourself, were they made immediately upon his return from the scientific expedition referred to?

A. I cannot now recollect whether they were or were not.

12 X Q. State how long after his return you witnessed these experiments, as nearly as you can recollect.

A. I am unable to do that, being wholly without other guide to my recollection than my memory that it was immediately upon his return that he began active experimentation on the electric light.

13 X Q. These experiments that you say you witnessed, is your recollection of them sufficiently distinct to enable you to describe them? If so, please do so.

A. No, sir; it is not. I only remember the fact of frequently seeing Mr. Edison and his assistants occupied with them. My interest was not enlisted; and I did not particularly examine into or investigate this branch of the laboratory work.

14 X Q. In answer to Q. 6 of your examination-in-chief you say you have "a not well-defined recollection of witnessing certain experiments with paper carbons for this purpose in the winter of 1878–'79." Please to state whether your recollection of the experiments referred to by you in that answer is distinct enough to enable you to describe them, and if so, please describe them?

A. My recollection is of seeing a feeble light, and of Mr. Edison remarking that here might grow out something from the American
Novelty Company experiments. I cannot say what his exact
3159 words were but this is the purport of them; nor can I describe otherwise the light that was shown.

15 X Q. How often did you witness experiments made by Mr. Edison in incandescent electric lighting with carbonized paper in the winter of 1878–'79?

A. I cannot say positively that such experiments as I saw were upon the incandescent principle at all, my recollection of these experiments being too indefinite to enable me to describe either the principle or the method of its application.

16 X Q. State, if you please, when you first saw this Exhibit Edison's First Incandescent Lamp.

A. It is impossible for me to state when I first saw it, Mr. Edison showed me the light on more than one occasion in its earlier stages. I have no recollection of the shape or design of the lamp referred to in your question.

17 X Q. State, if you know, when it was that Mr. Edison invented and made the tasimeter to which you have referred, for measuring the heat of the corona of the sun during the expedition to Colorado.

A. I cannot fix the date other than that it was during the time of his telephone experimentation, the tasimeter being an invention coincident with the telephone. It was some time during the latter half of the year '77 or early part of the year '78. This is my best recollection.

EDW'D H. JOHNSON.

3160 JOHN KRUESI, a witness produced in behalf of Mr. Edison, being duly sworn, testified as follows in answer to question proposed to him by GEORGE W. DYER, counsel for Edison:

1 Q. State your age, residence and occupation.

A. Age, 38; residence, Menlo Park, N. J.; I am a machinist, at present engaged in the Electric tube works, at 65 Washington street, New York, as manager.

2 Q. State how long you have been connected with Mr. Edison, and in what capacity.

A. For nearly nine years. About five years as machinist and four years as foreman of the machine shop.

3 Q. Please look at the paper which I now hand you marked Edison's Exhibit No. 4, and state whether the signature J. Kruesi, upon the same, is your own handwriting and when it was made.

Question objected to as immaterial.

A. I have examined the paper. The signature is my own handwrittng. I think it was made about the time the paper is dated. That is November, 1877.

3½ Q. Have you any doubt upon that point?

A. I have no reason to be doubtful about it, but I don't remember when I signed it.

4 Q. What was your habit or practice about signing similar papers?

Objected to as not competent. The question is as to when he signed this paper.

A. I generally signed them within a few days after they were written, or after the instrument was made.

5 Q. What is the earliest date which you remember, of Mr. Edison experimenting with electric lights?

A. I am not sure whether it was the summer of '77 or summer of '78.

3161 6 Q. What is the earliest date you remember of his experimenting with paper carbons for electric lights?

A. I don't remember the date when he began. When he experimented with paper carbon was in 1877, but I don't know what the paper carbons were for.

Counsel for Edison here closes his examination-in-chief of this witness, and submits him to counsel for Sawyer and Man for cross-examination.

Cross-examination by AMOS BROADNAX, counsel for Sawyer and Man:

7 X Q. What experiments did you see Mr. Edison make with paper carbons in 1877?

A. I don't remember any experiments.

8 X Q. Was you foreman of Mr. Edison's machine shop and his laboratory, and generally of his mechanical works at Menlo Park?

A. Yes, sir.

9 X Q. When did you commence to be foreman and when did you cease to be foreman?

A. I commenced in December of 1877, and ceased to be foreman in February, 1881.

10 X Q. Do you recollect seeing Mr. Edison make any experiments in electric lighting with carbonized paper during the time that you was foreman?

A. Yes, sir.

11 X Q. When did you first witness such an experiment?

A. The earliest I remember was in 1879.

12 X Q. What time was it in 1879?

A. I think it was in summer.

13 X Q. What was the experiment?

A. Paper-carbon horseshoe, substantially like this in Exhibit Edison's Commercial Incandescent Electric Lamp.

14 X Q. Do you recollect seeing Mr. Edison experiment with carbonized paper in this lamp marked Edison's Exhibit First Incandescent Lamp?

3162 A. I do not recollect it.

15 X Q. State where you first saw that lamp.

A. In Newark, N. J.

16 X Q. When?

A. Before we moved to Menlo Park.

17 X Q. What was it used for?

A. It is used with an air pump for experiments.

18 X Q. Have you seen the lamp frequently since?

A. No.

19 X Q. Did you ever see it in the laboratory at Menlo Park?

A. I recollect to have seen it at Menlo Park; yes, sir.

20 X Q. Whereabouts did you see it in Menlo Park—in the laboratory?

A. Yes; in that building which we call the laboratory.

21 X Q. Whereabouts was it kept in the laboratory?

A. I don't know that it ever had a certain place.

22 X Q. Was it in plain sight most of the time?

A. Yes, sir; I think so. Everything was in plain sight. There was nothing stowed away.

33 X Q. During the time that you was machinist, and before you became foreman, was you frequently and constantly going in and out of the laboratory as a workman?

A. Yes, sir.

24 X Q. And the same is true during the time that you was foreman?

A. Yes, sir.

25 X Q. Did you put these binding posts on this lamp, Edison's first incandescent lamp?

A. No; I did not put them on personally?

26 X Q. Did you see them put on?

A. No. I do not recollect.

27 X Q. Do you know who put them on?

A. No; I do not recollect who put them on.

28 X Q. Do you know when they were put on?

3163 A. No.

29 X Q. Who did you have in the machine shop at Menlo Park that done that kind of work during the time that you was machinist there?

A. I had several workmen at that kind of work.

30 X Q. Please to give the names of those workmen, and where they are now.

Q. Rudolph Heuse, who is dead. Echron, I don't know where he is. I think his first name was Albert, but am not quite sure. Baer was the name of another, I don't remember his first name, and I don't know where he is.

31 X Q. Referring now to Edison's Exhibit No. 4, do you know in whose handwriting it is?

A. Yes, I recognise it as Mr. Edison's own handwriting.

32 X Q. When was it written?

A. I think previous to that date there, or at the time of that date.

33 X Q. Do you know of your own knowledge that it was written then?

A. No, I do not.

34 X Q. Have you a distinct recollection of the experiments referred to by this paper?

A. No, sir.

35 X Q. Have you such a recollection of them as to enable you to state when they were made?

A. No.

36 X Q. At the time you signed this paper was that piece torn out between your name and Mr. Batchelor?

A. I do not recollect, but I don't think so.

37 X Q. Do you recollect whether anybody else's name was signed between yours and Mr. Batchelor's?

A. I do not recollect.

Cross-examination ended.

Re-examination by George W. Dyer, counsel for Edison:

3164 38 Q. How early do you remember seeing the lamp, Edison's Exhibit First Incandescent Lamp, with the binding posts on it, and the clamps inside of it?

A. I couldn't state the date. I recollect the lamp from general appearance.

JOHN KRUESI.

The taking of further testimony herein was adjourned by consent to Tuesday, June 28, 1881, at 10 o'clock.

WM. H. MEADOWCROFT,
Notary Public, N. Y. Co.

3165 Pursuant to adjournment this testimony was continued June 28, 1881, at 10 a. m., at same place, the same counsel being present.

FRANCIS R. UPTON, a witness produced in behalf of Mr. Edison, being duly sworn, testifies as follows in answer to questions proposed to him by GEORGE W. DYER, counsel for Edison:

1 Q. Please state your age, residence and occupation.

A. Age, twenty-eight; residence, Menlo Park, N. J.; occupation manufacturer of electric lamps.

2 Q. State whether at any time you went into the employment of Mr. Edison, and what your duties were.

A. I entered the employment of Mr. Edison about November, 1878. I can fix the date exactly by reference to my accounts, and will do so. My first occupation was making a search through the records of electric lighting in the Astor library. When this was completed to Mr. Edison's satisfaction, I entered his employ at Menlo Park to assist him in making calculations.

3 Q. What special training or acquirements had you for making such calculations?

A. Before entering college and while in college, I gave special attention to the mathematical branches. After leaving college I studied two years under Professor Brackett of Princeton, learning how to use physical apparatus, and becoming proficient in algebra and calculus. After that I spent one year in Berlin in the laboratory of Professor Helmholz.

4 Q. Please state now the particular branches connected with the electric light, which come under your immediate supervision after entering the employment of Mr. Edison.

A. In the first place, I made such calculations as were in my power regarding the electrical conditions necessary in a
3166 system of electric lighting in answer to questions asked by Mr. Edison, as, for instance, I have the memorandum, December 15, 1878, this problem given to me when I first came into the laboratory: "Example No. 1. 100 lamps, 10,000 ohms," (diagram shows lamps in multiple arc). "100 lamps, 1 ohm," (diagram shows lamps in series). "How much heat in each lamp. Heat=C^2R. Ans. the same." This problem is an example of the work I had to do. Besides calculations I assisted Mr. Edison in experimenting, translating and keeping records.

5 Q. At the time of entering into the direct employment of Mr. Edison in the latter part of 1878, what, if anything, was he doing in experimenting and perfecting electric lighting?

A. He was experimenting with the platinum spiral lamp with a thermal regulator. I remember helping to measure the expansion of the heated spiral of platinum. Besides this, Mr. Edison was making an extended series of experiments to find the laws of magnetism. He was also studying publications referring to constructions of dynamo machines.

6 Q. I wish to call your attention to experiments connected with determining the laws of resistance as applied to carbons, particularly those made of paper, and the mechanism and apparatus essential for the production of incandescent electric lighting.

Objected to by counsel for Sawyer and Man as impertinent.

A. Mr. Edison had me calculate the size and weight of cables necessary to carry the current to a certain number of lamps of given resistance (my impression is 100 ohms) at various distances from the machine, so that a certain per cent. of the energy in the circuit could be used in the lamps; he also had me construct tables showing the joint resistance of a number of lamps in multiple arc; Mr. Edison concluded that to make a successful electric lamp it should have in the neighborhood of 100 ohms resistance; he tried a
3167 large number of devices for obtaining this resistance from metal wire; at the same time he was carrying on experiments with the telephone; in the course of these experiments with the telephone, threads of carbon were made; he had these tested for resistance, and found them very high; this suggested to him the possibility of successfully making high-resistance carbon lamps; he, with the assistance of Mr. Batchelor, made a large number of lamps with carbon filaments; at that time my attention was more particularly drawn to the vacuum pumps and the construction of dynamo machines; I was employed in testing the efficacy of Mr. Edison's machine, and did not follow all the experiments that led to the paper loop; I recollect when one of the first successful loops was made; Francis Jehl and I measured the resistance, cold, of the carbon; my recollection is that it was about 140 ohms; the carbon was burnt for a number of hours and again tested, and no change found in its resistance; this was repeated several times, burning and testing until the lamp gave out. I remember that we all felt very much elated at the fact of the carbon not changing its resistance, for it showed that there was no wasting away of the carbon; we then felt that it was possible to make a system of the electric lighting, simply by adding to the life of the lamp, which we have since done.

7 Q. Of what material were the threads or filaments of carbon made, referred to in your previous answer?

A. My impression is, from ordinary sewing cotton; I recollect that Mr. Batchelor procured from the Clark thread works, special samples of cotton thread, afterward.

8 Q. When did you know of Mr. Edison's experiments on conductors made of carbonized paper?

A. I can only recollect now the finished loops as mentioned in a previous answer.

9 Q. When, to the best of your recollection, did Mr. Edison
3168 determine the prerequisite of high resistance for a successful incandescent electric light?

A. Early in 1879.

10 Q. How early was his attention turned to the production of more perfect dynamo machines?

A. He was experimenting on them before I entered his employ.

11 Q. When, so far as you know, did Mr. Edison turn his attention to improved means for producing a vacuum in electric lamps?

A. The first recollection that I have is when he sent me to Princeton to borrow a Geissler pump; I can't fix the date now, but may be able to do so.

12 Q. Did you at any time, under Mr. Edison's direction, experi-

ment on improved means for producing a vacuum in incandescent lamps, and if so, at what time?

A. By his wish I commenced to learn to blow glass; not succeeding at this, he advertised for a competent glass-blower, and the first glass-blower was a German from New York, and then a young man by the name of Boehm; I worked with these, helping to the best of my ability, in making pumps for producing a vacuum in incandescent lamps; before September 16th, 1879, pumps had been made that worked satisfactorily.

13 Q. At the time these means of producing vacuum had been determined, had resistance of carbon filaments been determined?

A. I cannot recollect.

14 Q. At this same time had the dynamo machines been satisfactorily perfected?

A. They were perfect enough to make us sure that if a lamp of sufficiently high resistance could be made, it could be used successfully in a system of electric lighting.

3169 15 Q. At what date did Mr. Edison produce an incandescent electric lamp, fit to compete commercially with gas?

Counsel for Saw-er and Man objects to the question as immaterial.

A. To the best of my recollection it was in November, 1879, when the stable resistance of a paper-carbon loop was determined.

16 Q. At that time was the system worked out, and the various forms of apparatus essential to carry it into successful use?

Objected to as immaterial.

A. Yes.

17 Q. From the date of your employment by Mr. Edison, have you labored constantly and incessantly under his direction in the perfection and production of incandescent lights, and the apparatus necessary to make them available?

A. With the exception of about two weeks, yes.

18 Q. When did Mr. Edison first produce for public exhibition his incandescent electric lamps with paper-carbon conductors?

A. The next day after the publication of the article in the New York Herald, which I find here, marked Edison Exhibit No. 2, dated December 21, 1879.

19 Q. Please look at the lamp now shown you, which is marked "Exhibit Edison's Commercial Incandescent Electric Lamp." State whether that represents the character of lamp referred to in your previous answer?

A. Yes.

20 Q. State, if you please, about the extent and kind of use made then and afterwards with that kind of lamp?

A. Wires had been run in the laboratory building. In connection with these, chandeliers had been placed so that the light from the lamps could be used while experimenting. Lamp posts were placed on the road to the depot. My impression is that this
3170 was all done before December 21st. The dynamo machines were in place. Mr. Edison was waiting for his foreign patents

to be issued, I understood at the time. Wires were also run to my house, and to Mr. Edison's house; in one case using a special line of poles, in the other the Western Union poles. The light was used in the hall and two rooms of my house, for all ordinary purposes, and while tests were being made, burned continually and without interruption for several weeks, from dark until ten or eleven o'clock. There were, I think, from sixty to over one hundred lamps in the circuit. While the public exhibitions were given my duty was to watch the dynamo machines, to see that no harm was done them, and to explain to visitors their working and the working of the light. I had a lamp hung over my dining-room table, which we used regularly to eat by at night. I remember having a dinner party, with one lamp hung over the table giving sufficient light. This was all done within three weeks after that publication.

21 Q. State, if you please, whether the data relating to these lamps was put in your charge. If so, about what time was it?

A. Mr. Batchelor started the book giving the hours burned of the lamps. The records of the lamps, I notice, is in Mr. Batchelor's handwriting until January 5th, 1880. After that time a young man named Herrick kept the record. I helped him at various intervals while he was keeping the record, examining into the accuracy of his records, and checking his figures. The record was kept for Mr. Edison, who wished to know the life of the lamps. If the lamps were scattered it required constant watching to make the record exact. The machines were run during the day and night. When Herrick was absent a slip was left for him giving the number of hours which the machines ran. If any lamp broke, notice was given him as soon as discovered. All the lamps were numbered, so that they could be recognized. The record I refer to is that from which Edison Exhibit No. 3 is taken.

3171 22 Q. When did you begin to manufacture lamps especially adapted for incandescent electric lights?

Question objected to as utterly immaterial.

A. About November, 1879.

23 Q. From an examination of the record of lamps before referred to, can you state about the average life of the lamp used in the latter part of 1879 and the early part of 1880, at Menlo Park?

Question objected to as immaterial.

A. I think that so much of the record as is printed is a fair statement, though it does not give several lamps that burnt an exceptionally long time. For example, one on the lamp post at the corner of Mr. Thornall's barn, which burnt from 1,400 to 1,500 hours. I recol- this lamp distinctly as giving a bright light. I recollect examining it to see if the number was on it. I have a tabular statement of the life of these lamps which I will endeavor to find and put in evidence.

24 Q. Did all these lamps about which you have just testified have carbon conductors made from paper?

A. Yes.

25 Q. Have you continued the manufacture of such lamps since?

A. Yes.

26 Q. What do you know of the sale to and use by other parties of such lamps—I mean electric lamps with paper-carbon conductors?

A. The steamship Columbia was fitted out in May of 1880, I think, with about 150 of these lamps. An exhibition was given while the steamer was at the dock in New York, lighting the saloon and a number of state-rooms.

27 Q. Was any publication made by you about the last of December, 1879, or early part of January, 1880, about the state of perfection at that time of Mr. Edison's inventions in incandescent electric lamps? 3172

A. I wrote an article about that time which was published in "Scribner's Monthly" for February, 1880. This article is a full description of Mr. Edison's labors to that date.

Article produced, put in evidence, and marked Edison's Exhibit No. 10.

The exhibit is objected to on behalf of Sawyer and Man as incompetent, irrelevant and immaterial, and not legal evidence in any sense.

28 Q. Mr. Man, in his testimony in this interference, speaks of using "principally ordinary blotting paper" for incandescent conductors for electric lamps. Have you had any experience in the carbonization of ordinary blotting paper; if so, with what results?

A. I have had some experience. Carbons made from blotting paper are easily broken and not as durable as carbons made from compressed paper.

29 Q. Mr. Man further testifies in the same interference of "rubbing down and working out by hand the carbons." Have you had any experience in this kind of manipulation of paper carbons?

A. I have never tried the process mentioned. I should judge it to be extremely difficult.

30 Q. Referring to the answer to X Q. 67 on page 18 of the printed testimony of Albon Man, what office would be filled by the interior conductor coated in the manner described?

A. I should say that the paper loop is mostly useful for mechanically holding the solutions with which it is said to be treated, and that the larger portion of the current would be carried by the carbon from the substances with which the loop is treated, so that the greater portion of the light would be given by them. The looser and more porous the paper the less will it carry the current and give the light from itself.

3173 By consent, this testimony was postponed until Wednesday, June 29th, 1881, at 10 a.m., at same place.

WM. H. MEADOWCROFT,
Notary Public, New York County.

Pursuant to adjournment this testimony was continued June 29th, 1881, at same place, the same counsel being present.

31 Q. I call your attention to your answer to question 23, and ask if Edison's Exhibit No. 3 gives a correct statement of the life of the lamps therein recorded as not destroyed, and ask you to supplement the history of the lamps which were not destroyed, so as to show their full duration?

A. So far as it goes it is correct, but on examining the records I find that the lamps are continued in another book, for example, lamp No. 159 is continued in Book No. 74, copying the original record and carrying the record to January 30th, 1880. The lamp is shown to have a life of 683 hours and 45 minutes.

Lamp 223, which is copied on page 3, burned 367 hours and 17 minutes.

Lamp 155 is recorded as burning 562 hours 14 minutes. 201 is recorded as burning 638 hours. Lamp 164 is recorded as having burned 640 hours 14 minutes. Lamp 172 is recorded as burning 638 hours and 14 minutes. I find these memoranda on pages 1 and 2; page- 5, 7 and 8; 9 and 10; 11 and 12; pages 13 and 14, respectively.

Counsel for Edison tenders the above record book for examination to counsel for Sawyer and Man, and puts in evidence copies of the pages above named, the same being marked Edison's Exhibit No. 11.

3174 Counsel for Sawyer and Man objects to the exhibit as an incomplete copy of the record referred to, and as impertinent, the copy being no evidence unless the record itself is put in.

32 Q. Have you read the printed record of the testimony of Messrs. Sawyer and Man in this interference?

A. The larger portion of it.

33 Q. Where a paper-carbon conductor built up in the manner described by Sawyer and Man in their testimony is used in an electric lamp, what special function as regards incandescence is exerted by the paper-carbon portion of such conductor?

A. As a mechanical support for holding the solutions with which the carbon is built up.

34 Q. Would not materials other than paper carbon serve for such a support?

A. Yes; asbestos for instance, in the cases where they dip the loop into solutions; or fiber of any description.

35 Q. I wish you would examine the answer of William E. Sawyer to the 18th question, and the statement about candle power, duration of burners, fracture, &c., and state what results would follow from the various conditions named in his answer?

A. I should judge from the surface of the lamp in Sawyer's Exhibit No. 4, and from the thickness of the carbon, that it might be possible for a lamp to last, giving twenty-five candles, for the time mentioned. The surface, I should think, is twice as great as that in Exhibit Edison's Commercial Incandescence Electric Lamp.

Since the economy of a lamp is inversely as the surface, it would take more power to obtain the same light from the Sawyer as from the Edison. At the same time the thickness of the carbon is so great that it should also last much longer than the Edison carbon. The resistance of the carbon shown in the drawing must be in the
neighborhood of 1 ohm at the most. This, in my opinion,
3175 renders the lamp totally uncommercial owing to the enormous
mous loss there must be from conduction through the clamps.
For example, the Edison carbon having 100 ohms and the clamp 1 ohm, only $\frac{1}{100}$ of all the energy used by the lamp will be lost in the clamp, while in the lamp, Sawyer Exhibit No. 4, if the clamp has a resistance of 1 ohm, the same as in the Edison, one-half of the total energy used in the lamp will be lost in the clamps. Besides this the increase of the size of the carbon allows more heat to be conducted from it to the clamps. As a result, I should judge it would be impossible to seal the lamp unless some device were used to dissipate this heat, making the lamp very large and clumsy.

36 Q. Referring now to the description and sketches given in the printed record of Sawyer and Man's testimony of the perfected lamp made by them, state whether in your opinion such a lamp would be a practical lamp, and give your reasons?

A. I do not think that it is a practical lamp. The first objection is on account of its low resistance, as stated in the previous answer. Besides the heat at the clamps, owing to the large currents that would have to be employed to give out sufficient energy for light from a small resistance, there would be a great deal of trouble in making the clamp last, as the tendency for arcs to spring between the clamp and the carbon would be so greatly increased.

I do not consider it possible to make such a lamp and hermetically seal it in a glass case, preventing any air from reaching it. Unless this is done, a carbon lamp blackens the globe that surrounds it very quickly. Judging from my experience with nitogen placed in the globe around a lamp, it would be extremely difficult for a carbon to give the same light continuously for a number of hours. I tried for over a week at one time to make a carbon, composed of paper only, burn in an atmosphere of nitrogen, without success.

I took every precaution that Mr. Edison and his chemist,
3176 Dr. Moses, suggested to make the nitrogen pure. The ex-
periment was carried on in the bell jar of an air pump. The
air was exhausted from the bell jar, and nitrogen drawn in; then again exhausted, and nitrogen again drawn in. I made the nitrogen, holding it in large bags, then, before drawing it in, the bell jar was dried and passed over hot copper filings. With loops made of paper only, no light could be made. I should also say that the lamp, Sawyer's Exhibit No. 4, if filled with nitrogen would soon lose it if lighted many times. When lighted, the gas inside the globe will be expanded, thrusting out the nitrogen. When cold the outside air will be drawn in to replace the nitrogen. Judging from the style of the lamp, I should say that the gas would

be very much compressed when the lamp was lighted, owing to the great amount of heat evolved in a small chamber.

Counsel for Edison gives notice that he here closes his examination of this witness, and offers him to counsel for Sawyer and Man for cross-examination.

Cross-examination by AMOS BROADNAX, counsel for Sawyer and Man:

37 X Q. What is your name?

A. Francis R. Upton.

38 X Q. Have you fixed the exact date, by reference to your accounts, when you went into the employ of Mr. Edison?

A. November 15, 1878.

39 X Q. Have you been continually in his employ from that time to this?

A. Yes, to the first of January, 1881, when I became superintendent at the lamp factory of which he is chief owner.

40 X Q. Where is the lamp factory of which he is the chief owner, and what kind of lamps are manufactured there?

3177 A. The factory is situated at Menlo Park; and the lamps are those suitable for his system of electric lighting.

41 X Q. Are the lamps that are manufactured at that factory, substantially like the lamp, Exhibit Edison's Commercial Incandescent Electric Lamp?

A. Yes, with the exception that bamboo is used in a large number on account of the ease of manipulating it, instead of paper, for the illuminating conductor.

42 X Q. Which makes the best carbon for electric lighting by incandescence, paper or bamboo?

A. Bamboo.

43 X Q. How is bamboo superior to paper, for that purpose?

A. On account of the difficulty of procuring paper of even thickness, and because the fibres of bamboo are continuous in the direction in which the current flows.

44 X Q. How does the resistance of an illuminating conductor made of bamboo compare with the resistance of a similar conductor made of paper?

A. The resistance of the bamboo is slightly less than that of paper.

45 X Q. Is the difference in the resistance of the two carbons sufficient to affect the practical working of the lamp?

A. No.

46 X Q. Then, for all practical purposes, in this respect they are the same?

A. Yes, in so far as their illuminating properties are concerned.

47 X Q. What proportion of the lamps manufactured by you, are fitted with illuminating conductors made of carbonized paper?

A. One to two per cent., I should judge.

48 X Q. In preparing your carbons for electric lamps, do you treat them electrically in the presence of hydrocarbon gas?

A. No.

3178 49 X Q. What training have you had as an electrician?

A. A college course of electricity, the handling of electrical apparatus in the physical laboratory at Princeton, and one year's work at electrical measurements of various kinds at Berlin, before entering Mr. Edison's employ; since I have been with Mr. Edison I have made calculations concerning electrical matters, and assisted in a large number of electrical experiments.

50 X Q. Do you consider yourself an expert in the practical application of electricity in electric lighting?

A. So far as relates to the incandescent electric light, I do.

51 X Q. Before you went in the employ of Mr. Edison, were you acquainted with him?

A. I had met him once in a visit to his laboratory.

52 X Q. In answer to question 5 you say, when you went into the employ of Mr. Edison he was experimenting with the platinum spiral lamp with a thermal regulator, and was making an extended series of experiments to find the laws of magnetism, and was also studying publications relating to constructions of dynamo machines. How long did Mr. Edison continue on those experiments, and in studying publications referring to constructions of dynamo machines?

A. Up to the present time, I should say; of course with intermissions, giving time for his experiments to be carried out.

53 X Q. Does Mr. Edison still continue in his experiments upon the platinum spiral lamps with thermal regulators?

A. Yes; through his assistants.

54 X Q. I read your answer to question 6 of your examination-in-chief (counsel reads): Please to state when it was that he tested the thread of carbon made in his telephone experiments, for the purpose of ascertaining its resistance, referred to in the answer I read?

3179 A. My impression is that it was in August or September, 1879; that is the best of my recollection.

55 X Q. In answer to that question, you say: "I recollect when one of the first successful loops was made, Francis Jehl and I measured the resistance, cold, of the carbon." State, as nearly as you can recollect, when it was that you and Francis Jehl measured the resistance of the paper-carbon loop, referred to in that answer.

A. To the best of my recollection in November, 1879.

56 X Q. You say, in answer to the same question, that your attention was more particularly drawn to the vacuum pumps, and to the construction of dynamo machines. State, if you please, when it was that you succeeded in getting a pump by which you could obtain a satisfactory vacuum in the illuminating chamber of your lamps?

A. To the best of my recollection, in July, 1879.

57 X Q. In answer to that same question, you also say: "I remember that we all felt very much elated at the fact of the carbon not changing its resistance, for it showed that there was no wasting away of the carbon; we then felt that it was possible to make a system of electric lighting simply by adding to the life of the lamp,

which we have since done." State, if you please, in what way you have since added to the life of the lamp.

A. First, by making better clamps for the carbon, so as to hold the carbon firmly, and prevent arcing. Secondly, by making better carbons. Third, by improved methods of getting the vacuum, so as to be sure that all the lamps are well exhausted, even when the workman is not expert.

58 X Q. In answer to question 11 you say the first recollection you have of Mr. Edison turning his attention to improved means for producing a vacuum in electric lamps was when he sent you to Princeton to borrow a Geissler pump. Have you been able to fix the date exactly when that was?

3180 A. I have not. I looked last night but could find no record by which I could fix the date exactly.

59 X Q. Was it after you went to Princeton to borrow the pump that you came to New York to advertise for a glass-blower for Mr. Edison, as stated in answer to question 12?

A. I did not advertise; but it was after that that Mr. Edison advertised for a competent glass-blower.

60 X Q. State, if you recollect in what paper it was that that advertisement was inserted?

A. My impression is the Herald.

61 X Q. Give the date as near as you can recollect.

A. It was in the summer of 1879. I can't fix the date.

62 X Q. How often did Mr. Edison advertise for glass-blowers; and state whether all the advertisements were subsequent to the time that you borrowed the pump at Princeton?

A. My impression is twice. All the advertisements were subsequent.

63 X Q. This lamp referred to by you as being at the corner of Mr. Thornall's barn, as burning from 14 to 1,500 hours—what was the luminosity of that lamp in candle power?

A. I should judge from 12 to 16 candles.

64 X Q. How long would such a lamp last, in your judgment, yielding a luminosity of 25 candle power?

A. From 400 to 600 hours.

65 X Q. What, in your judgment, would be the average life of the lamps, referred to in the record, about which you have been testifying, yielding a luminosity of 25 candle power?

A. As the lamps were then made, when not very good, they would arc at high candle power, excepting these, I should say from 100 to 200 hours.

66 X Q. Do you mean to be understood as saying, if the plan of the lamp was skilfully carried out in its construction and organization, it would endure from one to two hundred hours at a
3181 luminosity of 25 candle power—referring, of course, to the lamps noted in the record?

A. I do.

66½ X Q. Have you ever tried any of your lamps, like Exhibit Edison's Commercial Incandescent Electric Lamp, raised to a luminosity of 25 candle power?

A. We never have at that point. We have tried above and below, and my judgment is as stated.

67 X Q. At what luminosity have you tested the candle power of the lamp referred to in my last question?

A. At 48 candles.

68 X Q. How long did the carbon endure at a luminosity of 48 candle power?

A. My impression is, somewhere in the neighborhood of 15 hours.

69 X Q. What size was the carbon?

A. Substantially the same as that in the Exhibit Edison's Commercial Incandescent Lamp.

70 X Q. In answer to question 27 you say that you wrote the article contained in "Scribner's Monthly," for February, 1880, marked Edison Exhibit No. 10; are the statements of facts contained in that article true, of your own knowledge?

A. So far as I was able to verify them they were.

71 X Q. At the head of that article I find the following statement: "Editor Scribner's Monthly, Dear Sir, I have read the paper by Mr. Francis Upton, and it is the first correct and authoritative account of my invention of the electric light. Yours truly, Thomas A. Edison, Menlo Park, N. J." Was that written by Mr. Edison?

A. It was, at the suggestion of the editors of "Scribner's Monthly." The fac-simile of the letter as written by Mr. Edison is published in the fore part of this book.

72 X Q. Did Mr. Edison revise this article before it was published?

A. He revised portions of it.

3182 73 X Q. Did he read the whole of it before it was published?

A. I cannot say. I think he did not read the historical part.

74 X Q. Which one of the patents granted to Sawyer and Man is "for a stick of carbon rendered incandescent in nitrogen"?

A. In answer to the question I refer to the patent 205,144.

75 X Q. Now please to point out the claim in that patent that is "for a stick of carbon rendered incandescent in nitrogen"?

A. Claim 16 is the one that I referred to more especially, which reads, "In the sealed globe of an electric lamp which contains an azotic or other atmosphere, an absorbent of carbonic acid gas," together with the following in the body of the specification, "To charge our lamp we prefer to employ nitrogen gas, and this we produce in the lamp by our improved process in a state of great purity."

76 X Q. Now, after reading the claim and the extract from the specification, don't you think your statement in your magazine article is too broad?

A. Not in a mere brief summary of the history of electric lighting as is purported to be given in the article.

77 X Q. Do you swear that the statement in the magazine article, of the Sawyer and Man patents, is an accurate statement of the facts as they appear in the patent?

A. The patent itself is the best evidence of what it contains. If what I stated is right it can be verified from the patent.

FRANCIS R. UPTON.

Postponed by consent to Thursday, June 30th, 1881, at same hour and place.

WM. H. MEADOWCROFT,
Notary Public, New York County.

3183

Edison's Electric Light.

By Francis R. Upton (Mr. Edison's mathematician).

Editor Scribner's Monthly.

Dear Sir: I have read the paper by Mr. Francis Upton, and it is the first correct and authoritative account of my invention of the electric light.

Yours truly, THOMAS A. EDISON.

Menlo Park, N. J.

The crowning discovery of Mr. Edison—the electric light for domestic use—is at last a scientific and practical success. A mistaken idea has been afloat that this new light was intended to be a rival of the sun, rather than what it really is,—a rival of gas. The contrivances of the new lamp are so absurdly simple as to seem almost an anticlimax to the laborious process of investigation by which they were reached. A small glass globe from which the air has been exhausted, two platinum wires, a bit of charred paper—and we have the lamp. The generator of the electricity is simpler than a gas-generator, and the wires for its distribution are more manageable than are gas mains and pipes. The light is equal to gas in brightness and whiter in color; it is inclosed and, consequently, perfectly steady; it gives off no appreciable heat; it consumes no oxygen; it yields up no noxious gases, and, finally, it costs less than gas. The difficulty of subdivision Mr. Edison has also overcome; in his method of illumination a number of separate lights can now be supplied from the same wire, and each one, being independent, can be lighted or extinguished without affecting those near it.

In order to a clear comprehension of the electric light, a few words upon the general subject are necessary. All illuminants are produced by the incandescence or white heat of matter. This matter may either be in a finely divided state—the particles widely separated—as in the flame of candles, lamps and gas jets, or an aggregation of particles, as in the calcium light. Both of these methods have been used in the various systems of electric lighting. Electricity flowing through a conductor generates a quantity of heat proportioned 1, to the amount passing through, and 2, to the friction, or resistance, of the medium. Ordinarily, the amount is hardly appreciable in a good conductor. When, however, a poor conductor forms part of the electric circuit, a heat is generated that, under certain conditions, rises steadily to whiteness, causing the substance

forming the imperfect conductor to become luminous. If the wire of an electric circuit be cut and the two ends, after being touched, are drawn slightly apart, the current leaps the chasm and a spark appears which vaporizes a small portion of the metal, and this forms a sufficient conductor to enable a constant electrical current to flow from end to end of the wire. When the two ends of the severed wire are properly tipped, a continuous and brilliant light may be produced. Carbon is found to be the best material for these tips, and so long as the current flows and the distance between the points is properly regulated, a storm of white-hot carbon particles is carried across the space, giving a brilliant illumination. This is the
voltaic arc, a light produced by the incandescence of finely
3184 divided matter. The broken circuit may be completed by
the interposition of some solid matter capable of sustaining a white heat without melting. Platinum and carbon were long thought to be the forms of matter which would best answer the purpose.

These methods of utilizing electricity presented so many difficulties that it was thought impossible to use either for domestic purposes. The objections to the voltaic arc were that the carbon did not offer sufficient resistance to the passage of the current, and that it wasted, the light therefore requiring either continual attention, or else some complicated mechanism, both troublesome and expensive, to keep the distance between the carbon points constant. (See Fig. 3.) The objections to platinum lay in its great cost and rarity, and the fact that its point of fusion is too low to ensure its successful use as the source of light. And finally the objection to all known methods was that the conductors necessary to the supply of any lamp then known would have been of such enormous cost and size as to be impracticable for general use.

In order to understand the difficulties of the problem presented to Mr. Edison, and the simple perfection of his lamp, a short summary of the history of the electric light will be necessary. The first method of illuminating by electricity was by the voltaic arc. About twenty years after the discovery of galvanism, or the modes of generating electricity by chemical decomposition, the voltaic arc was discovered by Sir Humphrey Davy. The battery of a single cell was succeeded by those of multiplied power. In 1812, by the use of a battery of 2,000 cells, Davy succeeded in producing an intensely brilliant arc measuring five inches. The experiment was, however, a very costly one, and had apparently no practical outcome; yet the effects produced by it were so brilliant that Professor Dumas, who repeated it in Paris, in 1834, predicted its final success as an illuminant, in spite of the enormous cost—six dollars a minute. For a number of years no improvement was made, the batteries then in existence being incapable of supplying a constant and steady flow of electricity. Daniell's invention in 1836 of a constant battery, used still in telegraphy, and Grove's improvement in 1839, of electrical generators, gave a new impulse to inventors. A constant and powerful current being supplied by these two inventions, the practical use of it was shortly afterward made in Morse's telegraph. In 1845, about the same time, we find that the first mechanisms for regulating the distance between the carbon points were independently invented by Staite and Foucault, who thus in another direction utilized the electrical power supplied by the batteries. Staite's patents show great inventive genius; in one of them there is a well-defined suggestion of the widely known Jablochkoff candles. In this field of research, as in so many others, the earlier investigators possessed a clearness of vision which enabled them to see further and more accurately than those who came after. Staite, before 1850, produced an electric light, which was exhibited in England, and was so favorably received that a company was organized and gas stock suffered a panic. Many other inventions were made, with a vast expenditure of time, ingenuity and patience, which, like those of Staite and Foucault, failed because of their great cost. It is not enough to invent a good light, nor even to perfect its mechanism; the cost of production must be small enough to enable it to compete with all existing methods of illuminating.

Electric lighting had now passed through three stages. It had been a brilliant laboratory experiment, it had been the subject of practical investigation, and it had been advanced to the precarious dignity of occasional use in the theaters and on great festal occasions. At the coronation of Alexander of Russia, the city of Moscow was lighted by numbers of electric lamps suspended in the old bell tower of the Kremlin, a thousand gilded domes glittering in the unearthly radiance, in happy contrast with the quaint arches of the old cathedral close at hand, while the river Moskva was transmuted into a stream of liquid silver.

The year 1860 saw improvements in generators. The force of steam was found to be convertible into electricity. In 1862 Faraday introduced the electric lamp into a British light-house. France and Brazil tried the same experiment, but even this failed to arouse public interest. The invention of the Gramme generator (though an instrument fully anticipating it had been lying for years in the cabinet of an Italian university) at last gave the impetus needed to set the inventors at work. This was soon followed by the Jablochkoff candles, the contrivance by which some streets in Paris are illuminated. So much for the history of illumination by the voltaic arc.

In 1845, to go back to the second method,—that of illuminating
by an incandescent solid,—an American named Starr, backed
3185 by George Peabody, went to England, and took out a patent
for the use of platinum, which had been already employed
in laboratory experiments, although it had never been used for
practical purposes. In the same year Grove speaks of reading by
an incandescent platinum spiral.

In 1847, Dr. Draper, of New York, made a number of experiments to test the qualities of highly heated platinum. He used a lever suspended by a straight wire, very much resembling a door latch held by a string. So marked was the illumination from, and the expansion of, the heated wire at the temperature required for the experiment that he wrote: "An ingenious artist would have very little difficulty, by taking advantage of the movement of the lever, in making a self-acting apparatus in which the platinum wire should be maintained at uniform temperature, notwithstanding any change taking place in the voltaic current." This suggestion, though so clear and practical, lay for twenty years unheeded, and would probably have done so much longer, but that Mr. Edison, with no knowledge of it, entirely independently made use of a similar device and proved himself to be the "ingenious artist," in his first electric light invention.

Fig. 1 shows the plan of the apparatus.* The current enters through the curled wire at the left, and flows from one post, P, to the other, P′, through a spiral and out at the right. It is carried to the top of the glass case, G, then through the straight wire, W, to the lever at A, then to the hinge, H, so that it escapes at the right. In passing through the straight piece of platinum wire, W, enclosed in the spiral the heat generated by the current causes the wire to expand. This expansion allows the lever, L, to fall until it touches the point, B. When this is done the electricity takes the short route through the lever and does not pass through the lamp. The wire, W, contracts and the process is repeated.

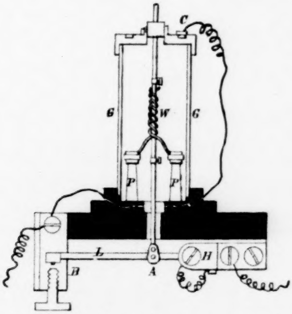

FIG. 1.—*Section of Edison's Expansion Regulator.*

Another method of accomplishing the same purpose is shown in Fig. 2. The current passes, in this case, through the wire, W. In

so doing it heats the air in G. The air in expanding forces downward the small metal bellows which is connected with the chamber, until the lever attached below closes the break, B, and short circuits

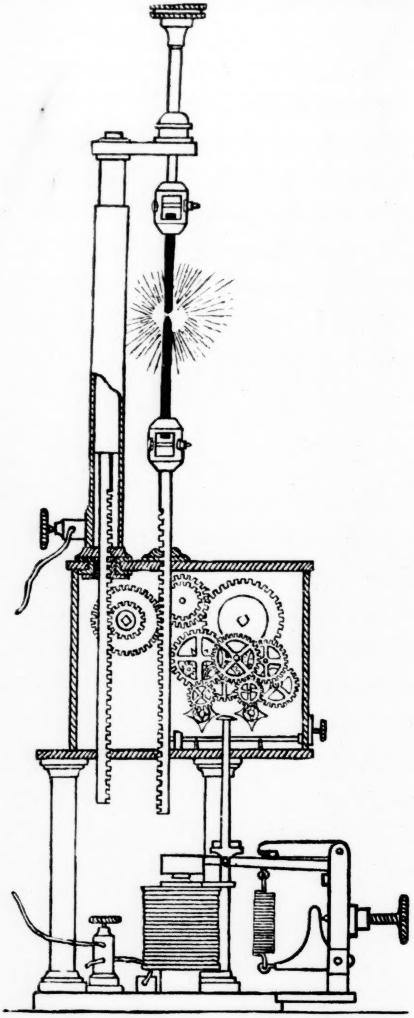

FIG. 3.—*Foucault's Regulator.*

the lamp, allowing the air to cool. These two inventions really belong to the infancy of electric lighting, though invented by Mr. Edison only a short time ago.

In 1849 Despretz describes a series of experiments on sticks of incandescent carbon which were sealed in a glass globe, the air being exhausted, or nitrogen substituted for it. He used several ingenious methods for holding the carbon—patented within the last few years.

So completely had the mode of lighting by an incandescent solid been forgotten, that in 1873 a medal was bestowed by the St. Petersburg Academy on Lodyguine for its supposed discovery, and letters patent were granted to Sawyer and Mann for a stick of carbon rendered incandescent in nitrogen. No successful light by incandescence had, however, been produced when Mr. Edison began his experiments.

In 1878 the lighting of Paris by the Jablochkoff candles was creating a great stir. It had been proved that electricity was really a rival of gas, and that, especially where great concentration was needed, it could take its place. The question now was whether light could be produced in such small amounts as to make it of general domestic use. The money value of an invention which could
compete with gas may be judged from the following items:
3186 The United States has $400,000,000 invested in gas, New
York and the vicinity owning about $35,000,000 of this; England has $500,000,000, $60,000,000 of which is in London. Paris has $40,000,000; Germany $50,000,000, etc. Capitalists, with these figures before them, and the further fact that notwithstanding the great depreciation in plant, the larger portion of this enormous capital was drawing ten per cent., were quick to see an opening for their money and enterprise. Several New York gentlemen, Mr. Grosvenor P. Lowrey and members of the eminent banking-house of Drexel, Morgan & Co. being the most prominent, placed $100,000 in cash at Mr. Edison's disposal, as the requisite means to make the research.

Mr. Edison came to the investigation unhampered by the blunders of his predecessors. He had never seen an electric light. He took hold of the subject in his usual clear-headed, practical way. Next to solving a problem, its intelligent statement is to an investigator the most important thing. Mr. Edison saw that permanence in the lamp and a subdivision of the light were the main things to be sought after. Of the two methods already described, he soon discarded the carbon arc. He perceived that from its nature this arc was inconstant, as its very existence depended upon the destruction of the carbon, and also that it presented greater difficulties in the way of subdivision. Even if he succeeded in conquering the latter difficulty, and was enabled to produce small lights, the carbon rods waste so rapidly that a system of such lamps would require an expert for every four or five houses to keep it in working order. The most effective apparatus then devised was Foucault's regulator, Fig. 3, which it will be seen is a very complicated piece of mechanism. The Jablochkoff candles, simple as they appear to be, require mechanical contrivances to light them and keep them burning, each candle lasting only a few hours, which makes the constant expense for new burners more than that of the electricity which they can utilize. Mr. Edison, therefore, concentrated his attention wholly upon the light from an incandescent solid.

The advantages of subdivision are twofold and may be explained in a few words. To show that a good gas jet or German student's lamp gives, near the source of light, all the illumination necessary for ordinary domestic purposes, a simple experiment may be tried. A printed page directly under the light, will be seen to be brightly illuminated. After carefully noting this, let another equally strong light be kindled. The room will be brighter, but the page will appear to be scarcely brighter. This is because beyond a certain limit the eye becomes insensible to light. One therefore gains nothing for ordinary use from a single intensely brilliant light. The object of such an illumination being of course to bring, by means of several moderate lights, all parts of the room up to that point where the eye, before it begins to be numb, can utilize the light. This explains the first advantage of subdivision;

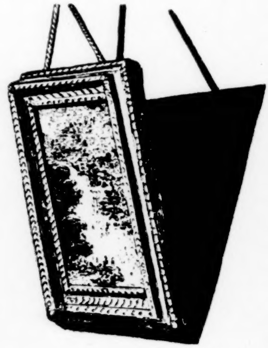

FIG. 4.—*Effect of Carbon Arc Illumination.*

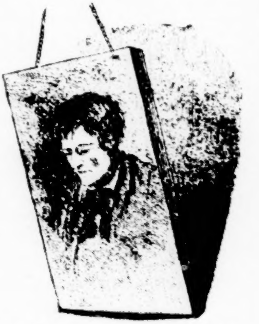

FIG. 5.—*Effect of General Illumination.*

3187 the second is of another kind. Every one familiar with the
electric light, as it has been exhibited, knows that the intense brilliancy of the light and the sharp definition of the shadows

as well as their depth, makes it most trying to the eyes. The same amount of light distributed among a number of burners would not give more illumination, but it would be of more practical value, the light would be more diffused, the contrast between light and shadow less sharp and startling. Fig. 4 shows the effect of a shadow from a single brilliant carbon light, and Fig. 5 the effect from several shaded lights; the advantage of the latter for practical and domestic use will be readily seen. This is equally true with other illuminators; though gas may be made to give out a brighter illumination per cubic foot when burned in a concentrated form, it is yet more grateful to the eye and less trying when burned as a number of small lights, so that sharp contrast shall be avoided. It is also found that the shape and size of flame, apart from the quantity of light emitted, makes a great difference in this respect—a large light softening the edges of the shadows. The shading of a light, although it obstructs illumination, is useful in diffusing it.

As has been said, Mr. Edison came to the subject unhampered. He saw that subdivision was his goal, and toward that he steadily worked. With a steadfast faith in the fullness of nature, a profound conviction that, if a new substance were demanded for the carrying out of some beneficial project, that substance need only be sought for, he set to work. Two examples of the reward of his faith may be mentioned. One of the great difficulties in the way of illuminating by an incandescent solid—a difficulty constantly urged as insuperable—was that platinum, though the most infusible metal which could be drawn out into a wire, still melted at a temperature too low to insure its successful use. Mr. Edison, by experimenting, found that by slowly raising a piece of platinum to a white heat in a vacuum, he could make a practically new metal, the fusing point was so greatly raised. Again, Mr. Preece, chief government electrician in England, declared, and was sustained by many others, that subdivision of the electric light was impossible, because of the enormous size of the conductors and the number of Faradic generators necessary. Edison simply introduced into his lamp an increase of friction or resistance to the electric flow, and the problem was solved.

Mr. Edison's idea in regard to the electric light was that, in all respects, it should take the place of gas. Following the analogy of water, the inventor conceived of a system which should resemble the Holly water works. As the water is pumped directly into pipes which convey it under pressure to the point where it is to be used, so the electricity is to be forced into the wires and delivered under pressure at its destination. In the case of water, after being used, it flows away by means of a sewer pipe, and is lost. But it is easy to imagine that the water used in working machinery, for instance, instead of being lost, might be returned to the pumps and used over and over again. With such a system as this, we should have perfect analogy to the Edison electric lighting system. The electricity, after being distributed under pressure and used, is returned to the central station. As the light results from no consumption of a material, but is mere transmutation of the energy exerted in the

pumping process, it is therefore seen that all which is es-
3188 sential to an electric lighting system is the generator (or pump),
the two lines of wire, one distributing the electricity, the other bringing it back, and a lamp which transmutes into light the energy carried by the electricity when it passes from one wire to the other, and in which the energy of the pressure expresses itself as the light. In Edison's invention the amount of electricity delivered in the lamp is determined by the size and resistance in the carbon, just as in water the amount of flow is determined by the size of the openings. As a great many small jets of water can be supplied from one pipe, so a great many lamps or small escapes for electricity can be furnished from one wire.

As in the case of water, the amount of work done by electricity—either as illuminant or motor—is dependent quite as much upon the pressure from which it escapes as upon the quantity passing through the wires. We might have a system of lamps which would give a certain amount of light from large quantities of electricity escaping under low pressure, or another system which could give an equal amount of light from a small quantity of electricity escaping under high pressure. As in either case the amount of electricity flowing through a wire is in proportion to the size of the wire, it will be readily seen that the application of pressure made by Mr. Edison obviates the main difficulty in the way of subdivision (*i. e.*, in the way of the domestic use of the electric light), namely, the enormous size and cost of conductors. The well-known principle of the effect of pressure upon the dynamic power of electricity had never been utilized because the proper lamp was still unknown. This lamp is Mr. Edison's main discovery. In order to utilize this, one of the plans devised by him was to make the flow of electricity intermittent. Enough was allowed to escape in a short time, say one-third, to keep the lamp all the time supplied. It of course would require a large wire to furnish the quantity of electricity needed, yet two-thirds of the time the wire would be inactive, during which period it could be used to supply two other lamps constructed on the same principle. According to the doctrine of probabilities, one-third of a large number of lamps would be in use all the time. Such being the case, the cost of a conductor would be divided among three lamps. The lamps were so constructed as to burn steadily all the while, although the electricity was passing through them only one-third of the time.

One form of apparatus for accomplishing this distribution among several lamps on the same electrical circuit is shown in Fig. 6. The current conducted by a single wire enters the wire, O, from the lower left-hand corner and flows through the spring, S, by way of B and B; upward through O′, around the magnets, M, M, and out through the lamp, B, B, are two points where the circuit can be broken if the spring, S, is depressed. Two points are made in order that the spark caused by the breaking of the circuit may be made less by division. The spring S is depressed by the arms, C, C, which are attached to the armature, A, by the rod, R. The action is as follows: The current renders the magnet active, it attracts the armature, A, and presses the spring, S, under, stopping the flow of electricity by breaking the circuit at B B. The magnet thus losing its power, the armature is drawn back by the spring to which it is attached and the apparatus is ready to work again. The period of this vibration may be regulated by means of a screw underneath, which can make the excursion of the armature more or less before it breaks the circuit, or can even act to break the circuit itself.

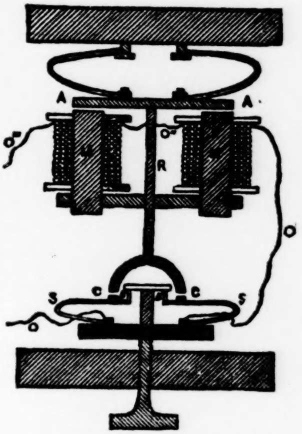

FIG. 6.—*Edison's Vibrating Regulator.*

In making an electric lamp which would be efficient without a
regulator (as is Mr. Edison's later invention), two things are essen-
tial, great resistance in the wire, and a small radiating surface. Mr.
Edison sought to combine these two essential conditions by using a
considerable quantity of insulated platinum wire wound like
3189 thread on a spool. This arrangement is shown in Fig. 7.
The spool was made of zircon, pressed extremely hard, and
was to be suspended in an exhausted glass bulb by two leading wires.
The platinum, as has been incidentally mentioned, was hardened
by alternate heating and cooling *in vacuo*, which is done by passing
electricity through it till white heat is reached and then cutting it
suddenly off. A theory is that the sudden cooling contracts the
metal and squeezes out the air contained in it.

One of Mr. Edison's greatest difficulties was to get a substance with which to insulate his wires that would not melt, and also become a conductor in the intense heat generated by the current,—in which case the electrical flow instead of traversing the whole length of the wire would flow across from layer to layer, or sidewise from wire to wire. This difficulty diverted his attention from platinum to carbon, which is infusible. He did not suspect, at first, that it could be made to offer sufficient resistance to the passage of the electric current, and that through it he was to reach a happy

solution of the entire problem. A long time was spent, with a fair degree of success, in seeking to make a spiral of lamp-black tar in the form of a wire. To hold this together he used a bit of ordinary sewing cotton which was covered with lamp-black, and succeeded in producing from an inch and a half of this simple thread, bent into an arch, a light equal to an ordinary gas jet. The lamp-black, however, contained air, which greatly interfered with the success of the method. He then used a simple thread, which he found to answer the purpose, though it presented the objection of being fragile, uneven in texture, and unmanageable. This difficulty suggested the use of charred paper, cut into a thread-like form. The difficulties apparently so insuperable melted away. The electric lamp was com-

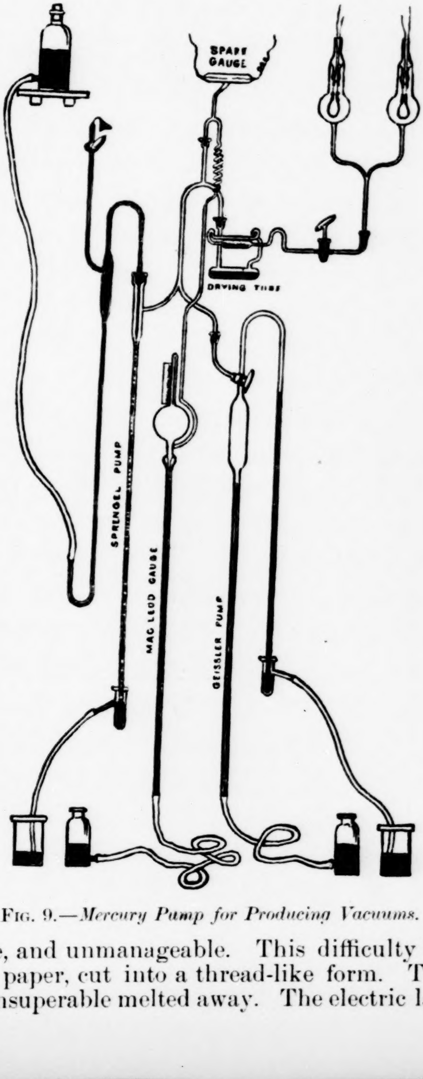

FIG. 9.—*Mercury Pump for Producing Vacuums.*

pleted. A piece of charred paper cut into horseshoe shape,
3190 so delicate that it looked like a fine wire, firmly clamped to
the two ends of the conducting and discharging wires, so as to form part of the electric circuit, proved to be the long-sought combination. From this a light, equal in power to twelve gas jets, may be obtained. Fig. 8.

The process by which the paper is rendered serviceable is also extremely simple and inexpensive. The horseshoe loops are cut from card-board and placed in layers, within an iron box, with tissue paper between; the box is hermetically sealed, and then raised to a red heat. Nothing remains but the carbon loops and the carbonized tissue paper. All other forms of carbon previously used had presented the difficulty of containing air or gas. The carbonized paper, however, is found to be perfectly homogeneous in structure, elastic, tough, and of an almost vitreous cleavage. It is strong enough to stand far more strain than will be put upon it in any ordinary use. If this paper were burned in air, or in a vacuum prepared by a common air pump, it would of course be almost instantly destroyed. In a high vacuum it burns, but is never consumed. The small glass globe which holds the simple apparatus is exhausted of air by means of nearly the same combination of the Sprengel and Geissler mercury pumps used by Crookes in making his radiometer, or "light mill," and in his wonderful discovery of the phenomena of radiant matter in high vacuums, recently brought before the Royal Society of England. Much attention has been bestowed of late on the question of securing good vacuums. An absolutely perfect one is unattainable. It is, however, found that, by the use of the mercury pumps and chemical appliances, where a nearly perfect vacuum is formed, the minute portion of air remaining shows some remarkable properties. When electricity under strong pressure passes through an Edison lamp, the whole bulb shines with a delicate blue light. So remarkable is the behavior of various substances in a vacuum prepared by means of mercury pumps, that physicists consider that a gas thus rarefied constitutes another state of matter, differing as much from that of an ordinary gas (either under atmospheric pressure or with the pressure removed by means of a common air pump) as a gas differs from a liquid, or a liquid from a solid. Mr. Edison's use of carbon in such a vacuum is entirely new.

The pumps are shown in Fig. 9; the Geissler pump is to the right and below. By raising a bottle which is connected with it, the air is forced out of a large glass bulb, and allowed to escape through the tube A. On lowering the bottle, the mercury flows back into it, leaving a vacuum in the bulb. The opening of a stop-cock allows some of the air which is left in the pump to flow into this bulb, when the air is again forced out as described; this is continued until the air is exhausted. The working principle of the Sprengel pump is the continuous dropping of mercury through a tube, each drop acting as a piston, carrying before it a small quantity of air. As
there is no return stroke, even by the aid of a small tube, the
3191 work of exhaustion goes on quite rapidly. The MacLeod

gauge in the center is so constructed that it will measure with exactness when less than one-millionth of the original air is left in the pump.

Another purpose besides that of preventing the destruction of the carbon is served by burning it in a vacuum. Almost all the electricity is converted into light, very little being dissipated by convection or conduction as heat. The little glass globe only an inch from this brilliant light remains cool enough to be handled, and does not scorch tissue paper wrapped closely around it.

Fig. 8 shows the lamp of its actual size. The current enters it by one of the wires, W. At B this copper wire is twisted and soldered to a platinum wire, which passes through the glass at C, and by means of a small platinum clamp into the horseshoe, L, from which, by as simple a route as it entered, it returns. L, the source of light, was made in the form of a horseshoe, in order to approximate to the shape of a gas jet, and is large enough to cause the edges of the shadows to be softened down, and so obviates the common objection to familiar forms of electric lighting. The carbon is sealed in a glass bulb, G G G G, the knob of glass, F, is the melted extremity of the tube by means of which the bulb was connected with the pumps. At the points, C, C, where the platinum wires are sealed into the bulb, some trouble was occasioned by the cracking of the glass, which allowed air to leak into the bulb. It will be noticed that the glass is now drawn up around the wire in a thin tube. This is found to heat and cool so rapidly that it is practically homogeneous with the wire, and even if the wire be heated red hot it will not break. Mr. Edison has tried putting a lamp alternately on and off the circuit for several hours by means of a telegraph key, without loosening the wire. This experiment was equivalent to using the lamp several thousand times.

Mr. Edison has thus succeeded in making a lamp of the simplest imaginable construction, and of materials whose expense is extremely small. The paper costs next to nothing, the glass globes very little, and the platinum tips of the wires are so small that, though the metal used is expensive, their cost is trifling. The test of the value of every invention is its simplicity, and this is the crowning characteristic of Mr. Edison's lamp, for it is really nothing more than a piece of wire looped into a glass globe.

The lamp being complete, let us consider the generator [Fig. 10], for which Mr. Edison has proposed the name Faradic, in honor of the great physicist.

The cylinder which is placed below, between the blocks of
3192 iron, F, on which the magnets, M, rest, is called the armature,
and is so arranged that it can be made to revolve rapidly by means of a belt. This armature consists of a small cylinder of wood, which is wound around with iron wire as thread is wound on a spool, the ends being made as in a spool, to hold the wire in place. Around the whole spool are a number of loops of copper wire, covered with cotton thread, running lengthwise of the armature. The ends of these loops may be seen as they are taken from the armature to the cylinder, C, which is an extension of the arma-

ture, by which the currents generated in the copper wire may be taken away from the machine. This cylinder, called the commutator, consists of blocks of copper that really represent the ends of the wire, which are placed side by side around the axis of the cylinder in such a manner that no current can pass from one to the other. Touching these as they revolve are brushes, R, made of copper wire, by means of which the electricity flows from the machine.

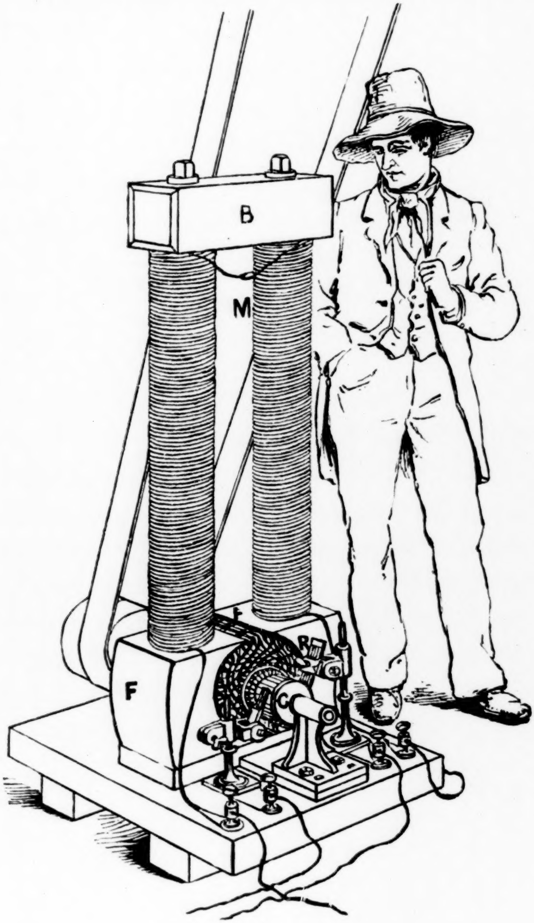

Fig. 10. *Faradic Generator.*

That the wire about the armature may be able to pump electricity into the line, it is needful that it be revolved immediately in front of magnets. The magnets are made of such large dimensions that the electricity, which is pumped through the machine, may meet with as little friction as possible in passing through the wire of the armature, since by means of the great strength of the magnets, very little wire can be made extremely powerful in forcing the electricity to a higher level or in putting it under pressure. It is exactly as in pumping water, if we have a poor pump (analogous to a machine with a poor magnet) the water may meet with an enormous friction in the pump itself, or require two or more, perhaps, to give it the required pressure, while in a good pump all the parts are so made that while great pressure is given to the water, it passes through it with the utmost freedom. The machine has such strength that it is intended to use only a small fraction of the power, which it could convert into electricity, and deliver outside.

It is proposed to mass a large number of such machines, as in Fig. 11, and have them all pump electricity up from one wire into a second. The two large wires, held on supports above the floor, are intended, the one to carry the electricity away, and the other to bring it back after it has been used. Two machines are placed at one side; these are for the purpose of rendering active the magnets of all the others.

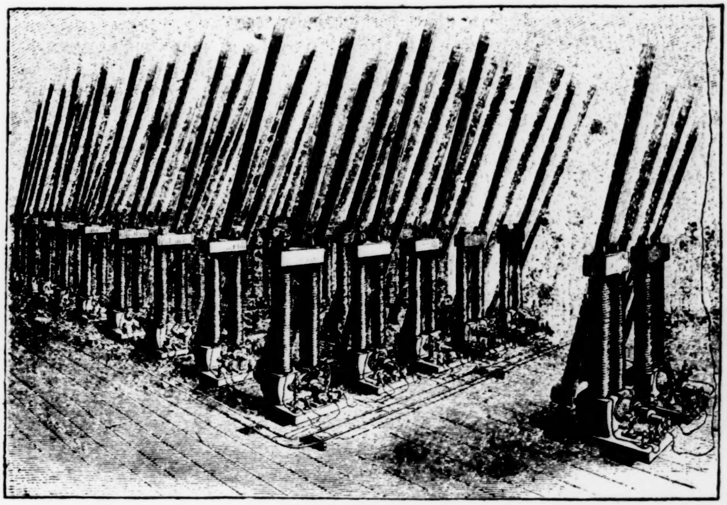

FIG. 11. *Proposed Central Station.*

3193 It is proposed to establish such stations in the course of a few months in the heart of several of our large cities. These will supply houses for quite a distance around them. 1,000 horse power is thought to be a sufficient amount for a unit, and the stations will be at such distances from one another that each district will require about this amount. The engines will be divided into four groups of 250 horse power each, with a spare one in each station of the same power.

The wires will be laid in fascines or bundles under the edge of the sidewalk in a tight box. The object of this is to make them easy of access and easy to place in position. Nor is there need of putting them out of the reach of the frost, for they are continuous and not liable to leak from change in position. Even more important is the fact that the colder the wires are the less is the waste of electricity, thus giving a decided advantage over gas in winter, when most light is needed.

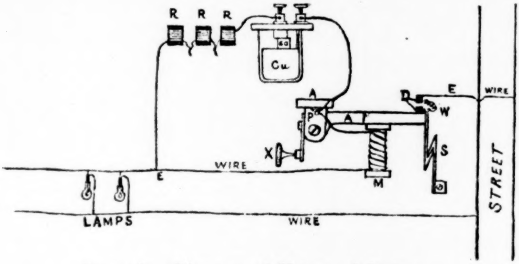

FIG. 12. *Diagram of Meter and System.*

The main wires may be either of iron or copper according to the market price of these metals; as quotations are to-day the preference is slightly in favor of copper wire. These lines of wire will start from the central station and send out branches in the same manner that gas or water pipes diverge, growing smaller the farther they are removed from the central station. Fig. 12 also shows the branch wires as they enter the house. It is proposed to color the distributing wires red and the waste wires green. These two distinct wires will be carried all through the house, and every lamp will be so placed that the electricity will flow through it from one wire to the other.

Before passing into the house, the electricity is carried through a sort of meter containing a safety-valve, by means of which it can be measured. The contrivances for doing this are shown in diagram, in Fig. 12, and in perspective in Fig. 13. The lettering is the same in both for identical parts. The current enters at E, passes through the two platinum points, D, then through the armature, A, to the dividing points, P P. The larger portion of the current then flows around the magnet, M. The armature above the magnet is held from it by means of the spring, X. The object of the device is to furnish a means of cutting out a house if too large a flow of electricity by any accident should occur. The magnet would then be capable of drawing down the armature which would separate the platinum points, D, and break the circuit.

The small wire, W, serves a double purpose and is a remarkably clever solution of a double problem. First: If the circuit were partly opened it would weaken the magnet, and the armature would recede, closing the circuit. It would thus form a vibrator resembling Fig. 6. The wire, W, allows enough electricity to pass to close the snap, S, so that the armature is firmly held in place, after which the wire, W, will melt off and completely break the flow of electricity. 3194 Secondly, the wire serves another purpose: If the points were drawn apart an arc would spring between them. The wire,

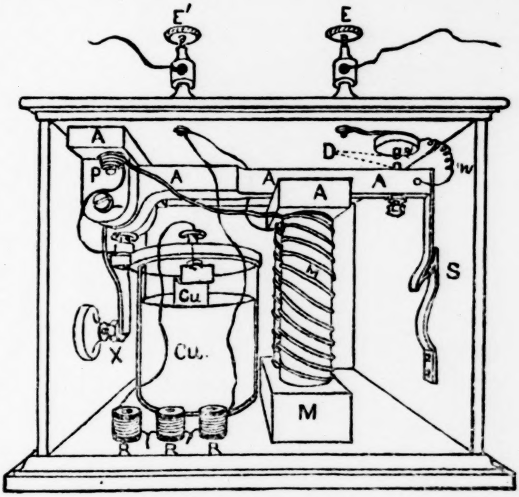

Fig. 13. *Edison's Electric Light Meter.*

W, conducts the electricity by a shorter route than that offered by an arc and so keeps the space between the two points free from the intensely heated vapors of the metal.

A small fraction of the current passes by another route to the lamps, from the point P. It first traverses a length of wire wound on small spools marked R. The amount placed here will regulate the flow through this line. The current next passes through from one copper plate marked C *u* to another, through a solution of copper salt. In thus flowing, for every unit of current a certain amount of copper is deposited on a thin sheet, the amount for a lamp being once determined by burning one for a number of hours. It must be remembered that only a small amount passes through the meter, but that which passes is proportionate to the whole. It is proposed to make a standard lamp, which shall give a light equal to that from a gas flame consuming five cubic feet each hour. From this it will be calculated how much copper will be deposited, and the amount will be said to represent five cubic feet. The bills for electricity will be made out in 1,000 feet, as in the case of gas. The inspector will take the strip on which the copper is deposited to the central station, in order to determine the amount of electricity used.

Besides giving light, the electricity supplies a convenient form of motor for domestic purposes. A small electrical engine placed beside a sewing machine for example, and connected with the distributing wire, may save all the fatigue of treading the machine, at an expense exactly equal to that of one jet burning for the same time. Elevators may be lifted, lathes turned, and instruments operated up to several horse power, by this same means. Fig. 14 shows the form adopted by Mr. Edison. It is substantially a small model of the large Faradic machine, the only change being in the fact that the armature, C, is placed lengthwise of the magnets, M M, instead of across them. At S is a switch by means of which the motor can be started or stopped. It is expected that the amount of power used in the daytime will largely pay for the expenses of generating—an additional advantage over gas.

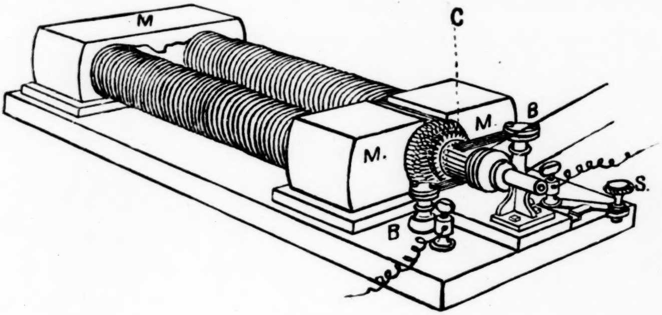

Fig. 14.—*Edison's Electric Motor.*

In order to use the lamp, it is brought into the circuit by turning a handle in a certain direction, or thrown out by reversing the motion, or by means of plugs, which are inserted in a socket. This may be done either in the chandelier or in any other convenient place in the house. Very simple arrangements may be made so that by touching a knob by the bedside the whole house may be brilliantly lighted for the reception or discovery of a suspected burglar. Of course, no matches have to be used; the light kindles itself by the turning of a handle, and so one fruitful source of destructive fires is avoided.

In order that the philosophical relations of the processes may be understood it is needful to trace the history of the energy as it is taken from the coal and conveyed over the wire to the lamp. A large portion of the heat produced by the combustion of the coal under the boiler is found in the steam as it flows to the engine. By means of the latter a small fraction, about ten per cent. of the original energy, is transformed into the motion of the wheels attached to the engine. It may be traced as it flows through the belt to the shaft, and again as it is carried from the shaft to any machine which it may drive. A belt exactly resembles, in carrying power, a man pulling a shaft around by means of a rope. The amount he is pulling can be measured by the strain on the belt, and the work he is doing by determining the speed with which he carries

the end of the rope. Mr. Edison has made a device, repre-
3195 sented by Fig. 15, to measure this strain. The belt starting
from the pulley over the main shaft, C, is carried under a
pulley, A, which is attached to a large box containing heavy
weights. This box is placed upon a platform scale. The belt then
runs over pulley, D, which it has to drive, and under a wheel, B,

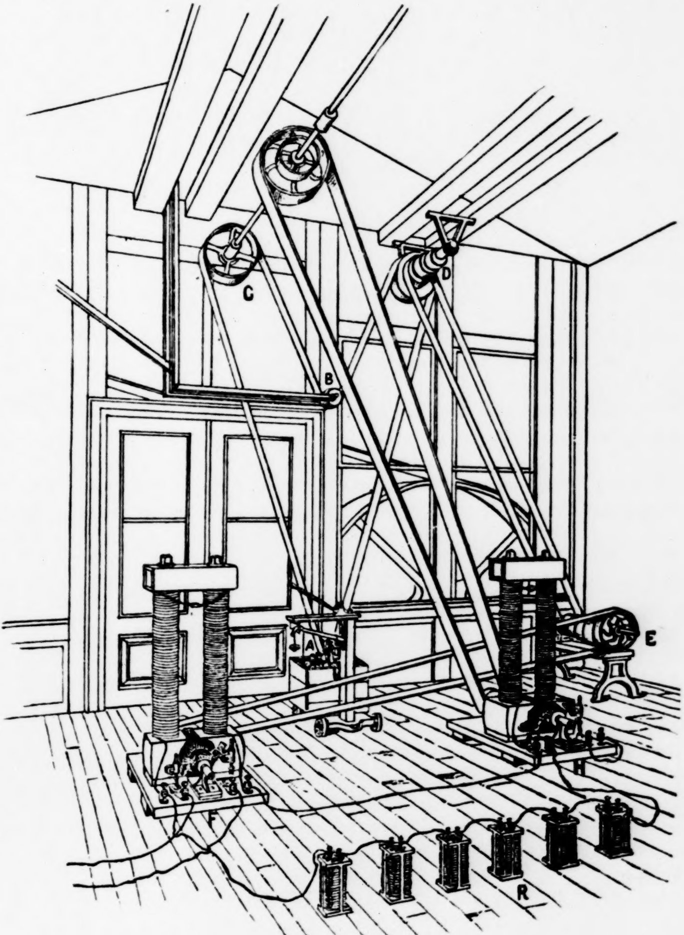

FIG. 15.—*Edison's Dynamometer, for Measuring the Force of an Electric Current.*

which rests heavily upon what would otherwise be the slack part of the belt, for the purpose of tightening it. The pulley, A, attached to the weight, will have a tendency to be drawn upward by any strain that may be put on the belt, just as the block of a tackle is drawn up when the rope is tightened which runs through it. The weight lifted may be measured by the diminution of weight on the scale, one-half of which gives the strain on the belt. Fig. 15 also shows the arrangement of machines as they were placed in order to be tested. The cones D and E were for the purpose of changing the speeds at which the machines were run. The machine, H, at the right, renders active the field of the other machine, F; the current may be regulated by passing through more or less of the resistance boxes, R. By means of this apparatus the exact amount of power carried by the belt can be reckoned when its speed is known. This latter measurement is made from the main shaft.

The energy which the belt carries is seemingly lost, as material motion, when it has turned the armature of the Faradic machine. Since this seems to be a point where the majority lose the track of the energy, in order to explain clearly allusion must be made to some fundamental experiments. Arago many years ago tried this experiment: a sheet of copper, which is not attracted by the magnet under ordinary conditions, was passed between the two poles of a powerful magnet, and it was found to be retarded in its motion. If the magnets are extremely strong, though the copper sheet to the eye passes through nothing but air, yet to the hand it seems
3196 as if it were cutting cheese, so strong is the drag put upon
the copper. This phenomenon Tyndall calls the apparent viscosity of the magnetic field. Faraday, a few years after this discovery, clearly explained the reason for seeming friction between the plate of copper and the invisible lines of magnetic force which he imagined to reach out from every magnet. He used wires and passed them in front of the magnet, and found that whenever they were made to cut these lines electricity was thrown into the wire. This grand discovery is at the basis of all that is now done in making strong currents, for it furnishes the method by which motion of mass may be transformed into the molecular motion called electricity.

As the energy appears in the wire, it is measured again by an electrical dynamometer, the main idea of which was that of Professor Trowbridge, of Harvard university.

By means of the two instruments, one is enabled to trace out the amount of energy absorbed and given back by the machine, and in many cases ninety per cent. of the original power applied is found converted into electricity. A system of electric lighting is nothing more than a gas system, where energy takes the place of vapors.

It is one of the laws of progress, that no sooner is a method for producing a certain result perfected than a practical use of it follows. This is attested by the history of many great inventions. Following out the laws of discovery, it has been for some time a speculation of the writer that the wonderful perfection to which vacuums had been brought, pointed historically toward some direct connection between them and the electric lamp. For the past few years no more striking result of scientific work has been effected than the startling phenomena shown in high vacuums; parallel with this, a growing want has been felt for a cheaper and more efficient mode of illuminating. Is this a mere coincidence? or may we believe that the demand and means of supply have been developing independently, but side by side; and that now in the electric light we find a practical application of what had been reached by purely theoretical research?

Besides the enormous practical value of the electric light, as domestic illuminant and motor, it furnishes a most striking and beautiful illustration of the convertibility of force. Mr. Edison's system of lighting gives a completed cycle of change. The sunlight poured upon the rank vegetation of the carboniferous forests, was gathered and stored up, and has been waiting through the ages to be converted again into light. The latent force accumulated during the primeval days, and garnered up in the coal beds, is converted, after passing in the steam engine through the phases of chemical, molecular and mechanical force, into electricity, which only waits the touch of the inventor's genius to flash out into a million domestic suns to illuminate a myriad homes.

3197 Pursuant to adjournment this testimony was continued June 30, 1881, at the same place, same counsel being present, and also Mr. Edison, one of the parties to this interference.

Mr. KRUESI recalled:

36 Q. I asked you in question 5 "What is the earliest date which you remember of Mr. Edison's experimenting with electric lights," to which you answered, "I am not sure whether it was the summer of '77 or summer of '78." Please state whether you have made such examination of memorandum books since giving the above answer, as will enable you to fix the time more definitely.

Objected to on the ground that it is a re-examination of the witness on a point about which he had already been examined.

JOHN KRUESI, a witness produced on behalf of Mr. Edison, testified on oath as follows, in answer to questions proposed by GEORGE W. DYER, counsel for Edison:

40 Q. Have you been previously examined in this case?
A. Yes.
41 Q. Since your former examination have you found a memorandum book which enables you to fix with certainty dates about which you were uncertain when you testified before?

Question objected to on the ground that it is intended to call out matter and facts about which the witness has been already examined.

A. Yes, sir.

42 Q. Refreshing your memory by such memorandum book,
3198 what is the earliest date you are able to fix in which Mr.
Edison was engaged in experimenting upon electric lights?

Objected to as immaterial.

A. January the 5th, 1877.

43 Q. If you have such memorandum book, please produce it and describe what the book is.

Objected to as immaterial and impertinent.

A. I do produce the book. The book is a memorandum book in which I put the time down for which I requested pay, showing how the time or in what the time was occupied.

44 Q. Is this book in your own handwriting?

A. Yes, sir.

45 Q. Were the entries made at the time marked in the book?

A. They were always made never later than the next following Saturday, and generally every day; sometimes even three or four times in one day.

46 Q. Please read from the book the items which bear upon experiments in electric lights by Mr. Edison giving the dates which appear in the book.

Objected to as incompetent to prove the contents of the book, unless the book is put in evidence.

A. "January 5th, 1877, electric lamp, 3 hours." "January 6th, 1877, electric lamp, 4 hours." "1877, January 20, air pump, 8 hours."

47 Q. For what purpose was the work done on this air pump under the date of January 20th?

A. To my best recollection for an electric light purpose.

Memorandum book referred to put in evidence and marked Edison's Exhibit No. 12.

Exhibit objected to as incompetent evidence upon any issue in the cause.

3199 Counsel for Edison gives notice that he here concludes his examination of this witness and offers him to counsel for Sawyer and Man for cross-examination.

Cross-examination by Amos Broadnax, counsel for Sawyer and Man:

48 X Q. Is this book in your handwriting—the whole of it?

A. Yes; I don't see anything that isn't my own handwriting.

49 X Q. In whose employ were you when you made this memorandum book?

A. In Mr. Thomas A. Edison's.

50 X Q. And does this book show the time you was at work on different kinds of work for Mr. Edison?

A. Yes, sir.

51 X Q. Where was you working from June the 13th, 1876, to January 2d, 1877?

A. I was working for Mr. Edison in Newark, N. J.

52 X Q. Are all the entries in this book made in lead pencil?

A. All except a few entries in the last four leaves of the book, and three entries in October, 1875.

53 X Q. Referring now to the entries in this book made on the page beginning with January 2d, 1877, do you swear that the entries on that page are all in your own handwriting, and that they were made by you on the day of the date set down in the left-hand column of the page?

A. Yes, I am positive that they are all in my own handwriting, and that they are put down not later than the next following Saturday to these respective dates, or on the same day that they are dated.

54 X Q. Does the column of figures on this page headed Particular Jobs represent the number of hours you were employed each day upon the job mentioned in the middle columns, in which the name of the job is given?

3200 A. Yes, sir.

55 X Q. Does this represent your own time, and not the time of somebody else?

A. It is only my own time.

53 X Q. By this book it appears that January 5th you worked three hours on electric lamps. What kind of electric lamp was you working on, and what was you doing to it during those three hours?

A. I do not remember the lamp, nor exactly what I did to it.

57 X Q. Is the same true as to the work it appears that you done on electric lamp on January 6th—four hours?

A. Yes, sir.

58 X Q. Is this your book?

A. Yes, sir.

59 X Q. Your own private property?

A. Yes, sir.

60 X Q. Has it been in your possession ever since it was made?

A. It has been in my possession ever since I made the entries.

61 X Q. Why didn't you refer to this book and produce it when you was previously examined in this case?

A. I was called to this examination from my place of business in the city of New York, and the book I kept in my house at Menlo Park, New Jersey. Therefore I did not have it at hand.

62 X Q. Have you got any more books bearing upon this subject?

A. Yes, sir. I have some more, but to my knowledge they do not bear upon this subject.

63 X Q. How does it happen that there are no entries in this book from June 13, '76, to January 2, '77?

A. The entries may be in another book, on account of the dissolving of partnership between Mr. Edison and Mr. Murray at that time. JOHN KRUESI.

3201 THOMAS A. EDISON resumes his testimony as follows, this 30th day of June, 1881:

375 Q. In your answer to question 374, you have not stated the nature of the duties of the assistants employed by you. Please do so now.

A. Francis Jehl was employed generally to assist in any kind of experiments; John Kruesi was foreman of the machine shop; Charles Clarke, mathematician and mechanician; Charles Batchelor, principal assistant on general experimenting; Wm. Hammer, assistant on vacuum pumps; Mr. Herrick, time-keeper for the lamps; Dr. Haid and Mr. Lawson, chemists; Martin Force, assistant on any experimenting; Dr. Moses, chemist and assistant on general experimenting; E. H. Johnson, assistant outside of laboratory generally.

376 Q. Have you been present this morning during the examination of J. Kruesi, and have you seen the memorandum book produced by Mr. Kruesi, and marked Edison's Exhibit No. 12?

A. Yes, sir; I have.

377 Q. In view of the testimony of Mr. Kruesi, and of your examination of his memorandum book, Exhibit 12, are you able to refresh your memory as to dates of early experiments with electric lamps?

A. I undoubtedly tried some experiment with an electric lamp about the time stated in the book, Edison's Exhibit No. 12, but I cannot remember the nature of the lamp or recall to memory the results of these experiments.

378 Q. Are you satisfied in your own mind that the repair of an air pump, noted in the memorandum book Exhibit No. 12, under date of January 29, 1877, had some connection with an electric lamp?

A. Yes, sir; my impression is strong that the pump was used in
connection with the electric lamp, as I cannot conceive what
3202 other use it could be used for about that time, and could con-
ceive that it could be used for an electric lamp.

379 Q. Since ceasing to give the testimony which you have now resumed, has search been prosecuted for exhibits relating to early experiments in electric lights, and if so, with what results?

A. Yes, sir; Mr. Batchelor has found two or three exhibits, one of which is in my handwriting, which I now produce.

Witness produces a paper which is put in evidence and marked Edison's Exhibit No. 13.

Exhibit objected to upon the ground that it is intended to prove the invention in controversy was made or conceived of previous to the time stated in the preliminary statement, and upon the further ground that it is immaterial to any issue in controversy.

380 Q. Please examine the paper, Edison's Exhibit No. 13, state when it was made, how you know that fact, and what it shows.

A. The sketch was made October 5th, 1877. It is signed by myself and is in my handwriting. It is witnessed by Charles Batchelor. It is headed electric light, and illustrates the principle for subdividing the electric light. The top figure represents a circuit in which there are resistances, around which are incandescent electric lamps, consisting of two electrodes with silicon between them. The second figure represents the same kind of electric lamps worked in multiple arc. The third represents them worked in series.

381 Q. Does this Exhibit No. 13 refresh your memory as to the

production of, and experiments with Edison's Exhibit First Incandescent Lamp, about which you have testified, and if so, how does it refresh your memory?

> Objected to, as going to show that the invention was made
> 3203 previous to the date alleged in the preliminary statement of Mr. Edison.

A. It does. It refreshes my memory as to the date that I tried the first incandescent lamp. Because I went from the carbon on to experiments with silicon, owing to the sensitiveness of the carbon to oxidation, and I know that the carbon experiment- were previous to the date of this exhibit, October 5th, 1877.

382 Q. Since you gave your testimony before in this case, have you been constantly absent from this office?

A. Yes, sir; I have.

Counsel gives notice that he here closes his re-examination of Mr. Edison, and offers him for recross-examination.

383 X Q. What qualities must paper carbon have to render it sufficient for an incandescent conductor in an electric lamp?

A. The paper should be free from adulterations and compact and well carbonized. It will then have a high resistance per unit length and thickness, and if cut as a filament the lamp in which it is used will have high resistance.

384 X Q. What qualities must any carbon have to render it sufficient for an incandescent conductor in an electric lamp substantially like Exhibit Edison's Commercial Incandescent Electric Lamp.

A. My impression is that all kinds of carbon, except, perhaps, the diamond, *and* the same, and their different appearances are due to their structural arrangement. I think that hard gas-retort carbon and paper carbon are the same kind of carbon, and the difference consists in their structural arrangements. Paper carbon, wood carbon, and, in fact, all carbon derived from vegetable organic matter of cellular formation when carbonized are very porous, hence the resistance to the passage of the current through a square millimeter section, and one inch long of paper carbon
3204 or wood carbon would be very much less than if the same
was made of hard retort carbon, and as a high resistance is a desirable thing to make a commercial incandescent lamp, then paper and other organic carbon has the desirable property owing to its cellular structure, of giving such high resistance. Almost any kind of carbon could be used under the conditions of the lamp, marked Edison's Commercial Incandescent Electric Lamp, and the same results could be obtained as to candle power and amount of energy. But the quality, or rather the aggregation of the carbon to form the incandescent conductor, should be such as to offer high resistance to the passage of the current to allow of commercial subdivision. And this quality organic carbon is possessed of.

Answer objected to by counsel for Sawyer and Man as irresponsive.

285 X Q. Question repeated and counsel disclaims any desire to induce the witness to reveal any new discovery he may have made in the treatment or quality of carbon, but asks him to state merely the qualities that he thinks the carbon should possess to make it suitable for an illuminating conductor in an incandescent electric lamp.

A. I do not think I can make my answer any plainer than I have already done.

386 X Q. Must it have the quality of hardness and uniformity of texture?

A. It must have uniformity of texture, but it is not essential that it should be hard, that is, the carbon as a whole.

387 X Q. Must the texture of the carbon be fine?

A. No, sir; it is not essential.

388 X Q. Must it be solid?

A. No, sir; I prefer to have it structural—formed of cells.

389 X Q. Must it be cellular, and must the cells be small or fine?

3205 A. It must be aggregated together in such a manner that the total weight of the carbon between the two electrodes shall, with a given radiating surface, be far less than if the carbon was perfectly dense, and the interstices may be large or small within the carbon.

390 X Q. Then as I understand you, it does not matter whether the interstices or cells be large or small provided the total weight of the carbon between the two electrodes shall, with a given radiating surface, be far less than if the carbon was perfectly dense?

A. No, sir; I speak within the limits of the ordinary size of organic vegetable cells.

391 X Q. Must the carbon have a high resistance?

A. The burner, as a whole, should have a high resistance, for reasons I have already stated.

392 X Q. When did you first discover that carbon made of paper would offer a high resistance to the passage of the current, to allow of commercial subdivision, so as to make it a suitable illuminating conductor for your lamp? I mean Edison's commercial incandescent electric lamp.

A. I knew that it had high resistance from my use of it in 1876 in rheostats, and in my telephonic experiments in 1877, and that it had a proper resistance to admit of subdivision in multiple arc. In my Exhibit No. 4, I have placed the boron, which is high resistance, in multiple arc and the silicon, which is low resistance, I was compelled to use in series, and I was perfectly aware when I made the Exhibit First Incandescent Lamp, that organic carbon was the proper kind to use, as with a small mass it had high electrical resistance.

Last part of the answer objected to by counsel for Sawyer and Man as irresponsive.

393 X Q. What was there in the experiments you made with Edison's Exhibit First Incandescent Lamp that enabled you to deter-

mine that carbon made of paper would offer a high resistance
3206 to the passage of the current so as to allow of commercial
subdivision, as you have stated?

A. I have already stated that I knew it beforehand.

394 X Q. Then there was nothing, as I understand you, in the experiment that added to your store of knowledge upon that point?

A. Not regarding the resistance of organic carbon, except confirmatory of what I already knew.

395 X Q. Then, as I understand you, when you made or caused to be made the lamp, Edison's Exhibit Commercial Incandescent Electric Lamp, you knew, not from any experiment upon the subject, but from your knowledge of the properties of paper carbon, that it would make a suitable illuminating conductor for your electric lamp, that it would offer a high resistance to the passage of the current, and would allow of commercial subdivision?

Question objected to upon the ground that it does not correctly state the testimony of the witness upon this subject, he having testified to experiments in 1876, which resulted in his knowledge of certain qualities pertaining to paper carbons.

A. I have already stated that I knew from my experiments in the use of carbonized paper in rheostats in 1876, in telephones in 1877, confirmed by the experiments in 1877, on the first incandescent lamp, and in 1878, also on paper carbons; that such carbon had such a high resistance as compared to its radiating surface, as to admit of commercial subdivision providing the incandescent conductor could be made small enough and be burned under proper conditions.

396 X Q. When did you ascertain whether or not the conductor could be made small enough and burned under the proper conditions?

A. I ascertained and obtained the proper conditions to
3207 allow of the conductor being made small enough, some time
in October, 1879. This was when it was placed in high
vacuum.

397 X Q. Without any reference to your experiments with your first incandescent lamp, did you know from your experiments with paper carbon in rheostats in 1876, and in telephones in 1877, that it would make a suitable illuminating conductor for an incandescent electric lamp?

Question objected to as obscure and misleading.

A. I knew upon the day that I tried the experiment on the first incandescent lamp, that such carbon would be suitable, which knowledge, as far as its resistance was concerned, was derived from experiments in measuring its resistance in 1876 and 1877, as I have stated.

398 X Q. Then, as I understand you, by your experiments with carbonized paper in rheostats in 1876, and in telephones in 1877, you had ascertained the resistance of carbon made of paper. Now, how did your experiments with Edison's first incandescent lamp

prove to you that carbonized paper would be suitable for an illuminating conductor in an incandescent electric lamp?

A. That experiment was not to prove the resistance of the paper carbon, but to ascertain if it could be made to stand at a high temperature.

399 X Q. Then, as I understand you, it was by that experiment that you determined the sufficiency of incandescent conductors for electric lamps, made of carbonized paper, as stated in answer to question 373 of your redirect examination?

A. I did not require any further experiments to ascertain whether paper carbon was applicable to incandescent lighting. I knew it was applicable if conditions could be obtained under which filements of it could be made stable at high incandescence.

3208 400 X Q. When did you first ascertain that carbon made of bamboo possessed the requisite qualities for an illuminating conductor in an incandescent electric lamp?

Question objected to by counsel for Edison as not being proper cross-examination, not pertaining to any matter brought out on direct examination, and not involved in this interference, and advises the witness not to answer the question.

A. I decline to answer.

401 X Q. Why do you decline to answer?

A. In the first place, I do not see as the counsel has any business to ask the question; second, it is not in controversy; third, my counsel advises me not to answer it; and fourth, that it would require hunting for exhibits, dates, and other data to give the proper answer, which I am not prepared to do.

Counsel for Sawyer and Man, in view of the witness' refusal to answer, declines to further cross-examine the witness, and requests the examiner to certify the question to the judges of the United States circuit court of the southern district of New York.

THOMAS A. EDISON.

By consent, the taking of further testimony was postponed to July 7th, 1881, at ten a. m., at the same place.

WM. H. MEADOWCROFT,
Notary Public, N. Y. Co.

3209 Pursuant to adjournment, this testimony was continued Thursday, July 7th, 1881, at 65 Fifth avenue, New York; the same counsel being present.

Charles Batchelor, a witness produced in behalf of Mr. Edison, testified on oath as follows, in answer to questions proposed to him by George W. Dyer, counsel for Edison:

1 Q. Please state your name, age, residence and occupation.

A. Name, Charles Batchelor; age, thirty-five; residence, Menlo Park, New Jersey; occupation, assistant to Mr. Edison.

2 Q. Please state how long you have been an assistant to Mr.

Edison, and what your particular labors and duties have been in that capacity.

A. I have been assistant to Mr. Edison for nearly eleven years; my occupation has been entirely during the last eight or nine years, the receiving of ideas and sketches, and afterwards carrying them out; making the necessary instruments myself, or with any help that I required; I have had general charge of all Mr. Edison's experiments during that time under himself.

3 Q. If you know of experiments of Mr. Edison's in 1876, in the carbonization of paper, please state about the same, somewhat in detail.

A. I remember some experiments in carbonization of paper in the summer or fall of 1876, in which paper carbon was made by him and myself for resistances; battery carbons, and other things that were to be sold by a company called the Novelty Company, I remember carbonizing strips of paper in pieces of gas tube, also sheets of paper in an old cast-iron box which we had lying around his laboratory. I do not remember what kinds of paper was used, with the exception that I remember carbonizing a number of sheets of tissue paper. The other papers were a variety of papers that were lying around the laboratory at the time. I also remem-
3210 ber that we carbonized there paper called bristol-board, besides a number of different kinds of wood.

4 Q. How extensive and long-continued were these experiments in the carbonization of paper?

A. They were not very long-continued. I believe the experiments lasted not longer than a fortnight, as far as the Novelty Company was concerned. My impression is that I carbonized paper later than those experiments for our own use in the laboratory.

5 Q. Had you proceeded before the end of 1876 in the carbonization of paper, so far that nothing more was needed in the way of information with regard to the proper carbonization, *per se*, of paper?

A. The experiments of 1876, of which I speak, answered their purpose as far as I am aware, the papers being properly carbonized. I believed we required to learn no more on carbonization for that purpose.

6 Q. During the time mentioned had you put such carbonized paper in electrical circuits?

A. Yes, sir; as some strips were intended for resistances. we had measured their resistance to see what variation there was in the carbonizing. I do not remember what resistance the carbon strips were, as we had no particular size for them.

7 Q. State, if you please, the next experiments you remember of as made under Mr. Edison's direction with carbonized paper?

A. The next experiment that I remember, was the use of carbonized paper in telephones. I have found a paper which refreshes my memory on that point, which is dated July 20th, 1877, and about that time we used carbonized paper in telephones for contact points and diaph-agms. The next experiment with carbonized paper that I can remember, is the cutting of strips of carbonized paper and

putting them into the lamp on the table here, marked Edison's Exhibit First Incandescent Lamp. I believe the strips were cut from carbonized paper that had been carbonized by us in 1876,
3211 and I believe I put them in the lamp about August or September, 1877.

Question and answer objected to in so far as it relates to the lamp marked Edison's Exhibit First Incandescent Lamp, or in so far as it has any reference to electric lighting by incandescence with paper carbons, as going to prove that the invention was made and used previous to the time alleged in Mr. Edison's preliminary statement.

Papers referred to in the previous answer is put in evidence, and marked Edison's Exhibit No 14.

(Here follows lithograph marked p. 3212.)

Exhibit objected to as immaterial.

8 Q. When did Mr. Edison first begin to experiment in lighting by electricity, to the best of your knowledge, recollection or belief?

Objected to as calling for the mere belief of the witness, which is not evidence.

A. I know Mr. Edison had frequently made experiments in electric lighting previous to the time I put the paper carbon in the lamp marked Edison's Exhibit First Incandescent Lamp, but I cannot tell just exactly what those experiments were. He had been experimenting for about a day on electric lighting previous to his telling me to put this paper carbon in the globe of this exhibit at that time. I find by a record book of Mr. Kruesi's, which is now in evidence, and marked Edison's Exhibit No. 12, which I believe to be true, that he did some work on an electric lamp in January, 1877. This, no doubt, was under my direction, but I have no memoranda to recall to my mind what the experiment was.

9 Q. What is the earliest experiment, to your knowledge, which Mr. Edison made with paper-carbon conductors in an incandescent electric lamp?

A. The earliest experiment that I remember is the one in
3213 which I put the paper carbons in the lamp marked Edison's Exhibit First Incandescent Lamp.

Answer objected to as intended to prove that the invention was made before the date stated in the preliminary statement.

10 Q. Please give in detail the history of the construction or fitting up of Edison's Exhibit First Incandescent Lamp so far as you know about it?

Objected to on the ground that it is intended to prove that the invention was made previous to the date stated in the preliminary statement.

A. The instrument marked Edison's Exhibit First Incandescent

Chas Batchelor
James Adams

(Edisons Exhibit No. 14) W.H.M.
notary public N.Y. Co.

Lamp was originally a philosophical instrument, bought by Mr. Edison for his laboratory, and is called, I believe, a Gassiot tube or cascade, and was intended to show the discharge of electricity *in vacuo.* It had been in the laboratory, I believe, since 1875. It was made into an incandescent lamp by myself, at the request of Mr. Edison in the summer or fall of 1877, he at that time wishing to try some experiments on incandescent carbon for lighting purposes. I put onto this instrument two binding posts, and also had made two clamps, which I put onto the ends of the rods inside the globe. At first Mr. Edison wanted a hard carbon piece put into the globe, but as I had great difficulty in making it small enough, and getting it in, he suggested that I should cut the carbon from carbonized paper, of which we had a quantity in the laboratory at the time. I did so, and succeeded in giving him a few of the carbons in the lamp. I do not believe the lamp has been used for any other experiments since that time.

11 Q. Please explain how you got the paper carbons into the lamp and held them in position there.

Same objection as before.

3214 A. It was a very difficult and tedious process to put the carbon in there, but I did it by unscrewing the ball from the top of the rod and also unscrewing the globe from the holder above the cock; also unscrewing the cock from the base, also unscrewing the packing cap. When these are all apart the top rod will drop out and the bottom rod can be left in the part having the cock. The carbon was now screwed to the clamp of the bottom rod whilst lying on the table. The other clamp was then screwed to the other end of the carbon, and all three together lifted and turned, so that the part having the cock would be topmost. The lamp also was turned upside down, and the rods and carbon carefully dropped through it. The top rod was then held until the packing and the packing cap were put on, when the whole was screwed together again and the ball replaced. The binding posts were put on the lamp to hold the connection wires from the battery.

12 Q. Please to state whether or not, after the carbon conductor was thus placed in position, the air was exhausted from the globe of the lamp, and if so, by what means?

Same objection as before.

A. After putting a carbon into the lamp the lamp was placed on the plate of an ordinary air pump, and the bulb exhausted as well as we could do it with that pump. The current of electricity was then applied to the carbon, and heated the same for some short time.

13 Q. Was the carbon brought up to a point of incandescence in the lamp?

Same objection as before.

A. Yes, the lamp did give light for a short time in each case.

14 Q. Please to state, if you remember, how numerous those experiments were.

Same objection.

3215 A. I cannot remember just the exact number I put in, but believe there were at least four.

15 Q. Do you remember from what kind of paper those paper carbons were made?

Same objection.

A. I cannot be sure what they were made from, as I did not make them at the time for the experiment. I remember I took a carbon sheet that was thin compared with others we had, but what kind of paper it was I do not know.

16 Q. Do you remember what was the size of the strips of carbon paper with which you experimented in that lamp?

Same objection.

A. I had no particular size given me by Mr. Edison, and I do not think I measured them, but should judge I made them three-quarters or an inch long, and about a sixteenth wide. The thickness of the paper, I believe, was about seven or eight thousandths.

17 Q. Did you give this lamp to Mr. Edison to be filed by him as an exhibit with his testimony in this case?

Same objection.

A. No, sir; I may have been the means of calling his attention to the lamp, because I told him I was sure that he had tried incandescent carbon paper previous to the boron and silicon experiments.

18 Q. Who found the lamp previous to its being put in as an exhibit in this case?

Same objection.

A. I do not know who brought the lamp in here. The lamp has never been lost, for it has been lying around the laboratory, generally in full view, ever since the experiment of putting the carbon in it.

3216 19 Q. Were there many other exhibits in the laboratory at the same time?

Objected to as immaterial.

A. There are and have been hundreds of such instruments in Edison's laboratory—relics of old experiments.

20 Q. How do know that this Exhibit First Incandescent Lamp was made and experimented with using paper-carbon conductors at the time you have testified?

Objected to as going to show that the invention was made previous to the date given in the preliminary statement.

A. I can only approximate the date of the putting in of the paper carbon from a paper in evidence marked Edison's Exhibit No. 13, which is dated October 5th, 1877, witnessed by me on or about that date, and in which silicon is used between two electrodes for incandescent lighting, and I know that the experiment on incandescent paper carbon, in the lamp marked Edison's Exhibit First Incandescent Lamp, was at least from one to three months before that.

21 Q. Is that recollection further strengthened by inspection of Edison's Exhibits Nos. 4 and 5?

Same objection.

A. It is; for I remember from them that we hoped at that time to get better and more stable results than we had previously got from paper.

22 Q. Referring to these Exhibits 4 and 5, state whether or not your signature upon the same is in your own handwriting, and if so, when was it made?

A. I recognize my signatures on both of these papers, and know that they were put on there by me, on or about the dates marked on the exhibits.

23 Q. After the experiments with paper-carbon conductors with
Edison's Exhibit First Incandescent Lamp, what was the
3217 reason of making experiments with boron and silicon, and
the other metals named in the Exhibits 4, 5 and 13?

Objected to as immaterial.

A. Mr. Edison hoped to get from them a more durable and unoxidizable substance than carbon for electric lighting.

24 Q. Referring again to Edison's Exhibit No. 13, please to explain what is shown and described in that exhibit.

Objected to as incompetent; that must appear by the exhibit itself.

A. Figure 1, on Edison's Exhibit No. 13, shows three incandescent electric lamps, in which the light-giving substance is silicon, each placed around resistances in the line, so that only a portion of the current goes through the silicon, and the whole fed with electricity from a magneto machine.

The figure directly under this No. 1, shows three incandescent electric lamps, similar to the three in No. 1, but placed in multiple arc, each one with its own resistance.

The bottom figure in this exhibit shows the same three lamps, I presume, although the word "silicon" is not there, and these three lamps are all placed in series; in all three cases the electricity is furnished by a magneto machine.

25 Q. Please make a similar explanation of Edison's Exhibit No. 4?

A. In Edison's Exhibit No. 4, figure 1 shows four of such lamps in multiple arc, and figure 2 shows three of such lamps in series, and an explanation is here made to show that other substances could be used besides silicon, as Mr. Edison has remarked on it that he has tried a number of other things, and suggests the better

method of working either boron or silicon; he also suggests
3218 on this mixtures of non-conductors and semi-conductors in
order to get a greater resistance when using low-resistance
materials.

26 Q. After the experiments described by you with Edison's Exhibit First Incandescent Lamp, what were Mr. Edison's next experiments with carbonized paper for electric lamps?

A. The next experiments that I remember in carbonizing paper for electric lamps were a series of experiments he had me make in order to get a good and light carbon for a lamp which was to be worked on a partial incandescence; I made a great many carbons about August and September, 1878, a great many of which were made from paper; some of these carbons, especially the smaller ones, were raised to incandescence in an exhausted bell jar of an air pump about that time; I believe I worked altogether, about that time, equal to about two months ordinary daily working.

Answer objected to upon the ground that it related to experiments made and carbonized paper burnt for electric lighting previous to the date alleged by Mr. Edison in his preliminary statement.

27 Q. What were the size and the form of the paper-carbon conductors used in these last-named experiments?

A. The thin ones were generally short—from two to three inches; the thick ones were sometimes as long as six inches; I believe I made as many as from fifty to seventy-five of the paper carbons, which ranged in diameter from three-sixteenths of an inch down to considerably below a thirty-second of an inch; it was difficult to get the small ones very long; the best method I found of making these carbons was to coat tissue paper, or very thin paper, with a mixture of tar and lamp-black, and then roll them up on a flat plate very tightly.

28 Q. Have you any recollection of applying these paper
3219 carbons to a lamp such as shown in Mr. Edison's patent No
224,329—if so, at about what time was that?

A. I do not remember a lamp similar to that shown in the patent referred to being made, except similar in principle; I made a lamp the same in principle as these, which I have found a portion of, in which one of these paper carbons was placed directly over six platinum points and guided in its descent by an upright arm, having a projection on it, with a hole through which the carbon could slip. I believe this lamp was used with three points and six points. The lamp was both an incandescent and an arc lamp—a slight arc forming between the points and the carbon. I cannot exactly tell the date of this lamp. I believe it was previous to Mr. Upton's coming with us in the laboratory, which I think was in November, 1878. I produce a portion of this lamp, showing the base and the six springs and holders screwed thereon, but the platina points have been taken out.

Portion of the lamp placed in testimony and marked Edison's Exhibit No. 15.

Answer and exhibit objected to as immaterial, and as referring to a lamp that is not an incandescent lamp, in the sense that that expression is used in the application for the patent in interference, but is an incandescent lamp in which the illuminating carbon, or electrode, is being continually consumed.

29 Q. Was this lamp, Edison's Exhibit No. 15, put in electric circuit and the paper carbon heated to incandescence?

A. Yes, sir.

30 Q. In this lamp, just referred to, was provision made to keep a constant electric continuity?

A. Yes, sir; the fact that the carbon conductor stood directly
3220 above the platinum or iridium points and was free to fall by gravity, kept it always in contact with the points.

31 Q. Were other experiments made at about this time by Mr. Edison, or under his direction, in connection with incandescent electric lights?

A. Yes, sir; at that time Mr. Edison was almost entirely occupied with incandescent electric lights. Mr. Edison about this time commenced the improvement of apparatus for getting a good vacuum. He was also experimenting at the time for the best dynamo-electric machine that could possibly be got. He was also endeavoring to get a lamp of high resistance from metals, such as platinum, nickel, iron and alloys of platinum-iridium. These experiments, on the perfection of vacuum apparatus, extended far into 1879.

32 Q. During that time also, namely, the latter portion of 1878, were not experiments going on on incandescent paper-carbon conductors *in vacuo*?

A. I have mentioned that we made experiments in August or September, wherein we placed paper carbons, made by myself, in a vacuum, and raised them to incandescence by the electric current in the bell receiver of the pump. To the best of my recollection, after these experiments were tried, Mr. Edison's attention was turned more particularly to the getting of this lamp of high resistance, which he required, from metals instead of carbon; this he succeeded in doing to a great state of perfection; but in doing so he had been able to get an apparatus for making a vacuum which was far superior to anything we had had before; and it occurred to him that, with such a vacuum, carbon however small, should be able to stand without oxidizing, which it had always done before.

By consent, this testimony was postponed to Friday, July 10, 1881, at 10 a. m., at same place.

WILLIAM H. MEADOWCROFT,
Notary Public, New York County.

3221 Pursuant to adjournment, the taking of testimony was resumed, July 8, 1881, at 10 a. m., at the same place, same counsel being present.

33 Q. Please examine Exhibit Edison's Commercial Incandescent

Electric Lamp, and state when lamps of that description were first made by Mr. Edison.

A. The lamp marked Edison's commercial incandescent electric lamp is one of a number of lamps made in October or November, 1879, and lamps of this description were first made about the middle of October, 1879.

34 Q. What kind of lamp is this exhibit you have just testified about?

A. It is composed of a hermetically sealed globe, wholly of glass, through which two platinum wires project on the inside, and to which is clamped a carbon conductor made of paper carbonized. This globe is exhausted of air.

35 Q. When did Mr. Edison first produce an incandescent electric lamp with a carbonized-paper conductor, in all respects complete and able to compete successfully with illuminating gas for light-giving purposes?

A. I believe about the middle of October, 1879, when he produced lamps similar to this lamp marked Edison's commercial incandescent electric lamp.

36 Q. At the date named, what progress had been made in generators, apparatus for producing vacuum, regulating apparatus, a system for lighting districts, and other matters and things essential for a commercial light for general use in cities and towns?

A. At this time everything was ready, to the best of my belief, and was only waiting for the perfection of the lamp to make the whole system a success, as directly we got the lamp we, in the shortest possible time, exhibited just such a system to the public, that being previous to Christmas day, 1879.

37 Q. Please to give a summary, in a connected way,
3222 mentioning dates, as far as possible, of the progress of the
invention of incandescent conductors for electric lights, made
of carbonized paper, from the beginning up to the completion of
the commercial lamp.

Question objected to in so far as it may be intended to bring out anything appertaining to the electric lighting by incandescence with the experiments on carbonized paper previous to the date of the invention alleged in the preliminary statement of Mr. Edison in this interference.

A. The history of electric lighting by incandescence with paper carbon by Mr. Edison, as far as I know it, is as follows: In the summer of 1877 he used strips of paper carbonized as an incandescent conductor *in vacuo*, and the lamp in which they were used is now in evidence and marked Exhibit Edison's First Incandescent Lamp. I should have said here that I remember Edison, within a day or two previous to this lamp being made, using carbonized paper as an incandescent conductor between two electrodes of a battery, but in the open air. The next experiment, or series of experiments, that I call to mind are the ones which I have before spoken of as being made in August or September, 1878. At this time my whole time and attention began to be devoted to development of his system of incandescent electric lighting. These paper carbons were made by coating thin papers with lamp-black and tar, and rolling up tightly into a rod, drying and carbonizing the same in a suitable furnace. Some of these paper carbons were put in between the two electrodes in an electric circuit, and raised to incandescence in a vacuum. At this time carbons made of paper were not the only things that we tried as incandescent conductors in a vacuum. We made many experiments with hard carbons, wood carbons, and some metals, such as platinum, nickel and iron. It had early been decided by Mr. Edison that the requisite 3223 material for his incandescent lamp should have a great resistance combined with the least possible surface, and I remember well that at this time and previous we used to expect that we should be able to get a substance for an incandescent conductor that would give us at least 500 ohms' resistance. The result of this latter series of experiments *in vacuo* had shown us that in order to get a high-resistance lamp from carbon in any form, it would have to be cut in an exceedingly fine filament. The paper carbons which we tried were larger than we should have to use if we wanted a higher resistance. With the vacuum we then got, and which we considered at that time to be good, the carbons lasted at the most from 10 to 15 minutes in a state of incandescence. The experiments on platinum led us to hope that it might be easier to get a high resistance from that metal than from carbon. From the date of the finishing of these experiments, which, I believe, was towards the latter end of October, '78, Mr. Edison turned his attention to lamps in which the incandescing conductors were formed of metals and alloys of metals. During the last part of the year '78, and up to October, 1879, I made, at Mr. Edison's request, a very large number of lamps having platinum and platinum-iridium composing the incandescent conductor. A great many of these lamps had their conductors coated with insulating material, in order to be able to wind them up close and get them into as small a space as possible in order to offer the least radiating surface. Mr. Edison very frequently sat down at my table and worked for hours helping me on these experiments. Our conversation frequently was directed to getting the highest resistance in the least possible space. I remember once or twice during these conversations, early in 1879, he remarked how easy it would be to get this resistance if carbon was only stable. During the time that I was experimenting on these lamps he had been busy experimenting to perfect the different apparatus composing his electric light-3224 ing system as a whole. I had also worked on these matters, but as our lamp was an exceedingly difficult job, the majority of my time, both night and day, with the exception of a week or two in which I devoted some time to telephones, was spent on the lamp. He had succeeded in making a more perfect dynamo machine. In testing the lamps with platinum conductors he had been continually improving the apparatus for exhausting the globes. In October, 1879, when he had got a very perfect vacuum for his lamps, he suggested the use again of carbonized paper as a conduc-

tor, and accordingly he had me cut a fine filament of paper, which we carbonized and put in a globe. This filament, I believe, was cut straight from paper, and bent round previous to putting in the carbonizing chamber. I do not remember what we did with this lamp afterwards; but within a day or so of that I cut a loop from paper similar in shape to the one now in Edison's commercial incandescent electric lamp. At the same time that these were being tried, I also made lamps of loops of carbonized thread, carbonized flax, fine filaments of lamp-black and tar rolled up and baked, and also threads which had been treated with lamp-black and tar previous to carbonization. All these things were used about the same time as incandescent conductors in electric lamps, and most satisfactory at the time being the carbonized-paper loop, which I had cut by hand. We immediately after this made a steel mould in which these loops could be cut quickly, and after a few experiments in the carbonization of them, in order to get their resistance as near as possible alike after carbonization, we made a number or these filaments and used them at an exhibition in Mr. Edison's house, about the 2d or 3d of December, 1879. When the first lamp was made which had a fine filamentary carbonized-paper conductor, from which the light was given, which was about October 22d, 1879, then, I believe, we had a system of electric lighting that was complete and could
3225 compete with gas, and we proceeded as expeditiously as possible
to exhibit as such.

38 Q. Did you start a record of the life of the early lamps put in position at Menlo Park, and if so, is Edison's Exhibit No. 3 a transcript of the first fifteen pages of that record?

A. I started a record about January 2d, but at that time a number of the lamps had been burning on exhibition for some time, and I remember, on looking at book 67, that as I did not know the exact time at which these lamps were put up, I allowed as near as possible for the time they had burnt. This is shown on page 1, where lamp 142 is recorded by me on January 2d, 1880, and after marking its resistance I remarked that it has burned at least 200 hours. I have compared the exhibit referred to with the book and see no variation.

39 Q. Please examine note book No. 74. State whether you commenced said record and had it continued under your charge. State whether or not Edison's Exhibit No. 11 is a correct transcript from said note book.

A. I have examined book 74, and I find it is a continuation of the record of lamps commenced by me on January 2d, 1880, and was continued under my direction through book 74. The Exhibit No. 11, as far as I can see, is a correct copy of the pages mentioned in the exhibit.

40 Q. Please state whether or not such records state the facts correctly.

(Here follow diagrams marked pp. 3226, 3227, 3228, & 3229.)

} p. 3229

A. They do. I was always very particular to have this attended to in a proper manner. It was the duty of Mr. Herrick to enter in these books their time, as they burnt, daily, and I believe that he did so. I was also very particular to have him mark down in the book the cause of their ceasing to burn; and if at any time he was not present when a lamp ceased to burn, it was generally made a note of by any one in the laboratory present, and put on Mr. 3230 Herrick's desk, so that he could go, take out the lamp and examine it, noting its defects.

41 Q. Have you read the testimony of Sawyer and Man in this interference, and if so, have you carbonized paper in the various modes described by them?

A. I have read the testimony and have made some samples of carbonized blotting paper in the same manner that is described in their testimony.

42 Q. Please produce such specimens, describing what each one is.

A. I here produce specimens of ordinary blotting paper carbonized, which were carbonized in a square iron box, filled with powdered charcoal. This carbonization was done in an ordinary fire.

Specimens referred to put in evidence and marked Edison's Exhibit No. 16.

I also produce a piece of carbonized blotting paper, the paper having been pressed before carbonization, as stated in answer to question 22 in Albon Man's testimony.

Said specimen is put in evidence and marked Edison's Exhibit No. 17.

I also produce a specimen—two sheets of ordinary blotting paper cemented and pressed together, as also stated in answer to question 22 of Albon Man's examination-in-chief.

Specimen put in evidence and marked Edison Exhibit No. 18.

I also produce a specimen of several sheets of blotting paper cemented together without pressure and carbonized, which may be meant in answer 22 in Albon Man's examination-in-chief. All these specimens were carbonized in an iron box, packed in powdered charcoal and heated in ordinary fire.

Specimen referred to put in evidence and marked Edison's Exhibit No. 19.

3231 I also produce a number of sheets of blotting paper in which two or more are cemented together and carbonized, the cement being different in this case from the former ones.

Specimen put in evidence and marked Edison's Exhibit No. 20.

43 Q. Have you also carbonized paper in the manner described in your testimony as having been done by Mr. Edison, and under his direction, in the earlier experiments?

A. I have carbonized also some samples of tissue paper similar to the experiments on carbonization of paper that I have testified to as being in 1876, and here produce the same.

Carbons put in evidence and marked Edison's Exhibit No. 21.

I have also carbonized some samples of strips of bristol-board, which I also remember are like the ones carbonized in gas-pipe tubes in the experiments of 1876.

Samples put in evidence and marked Edison's Exhibit No. 22.

44 Q. Where a paper-carbon conductor has been recarbonized and treated with the electrical current in a hydrocarbon bath, as testified to by Albon Man in answer to 67th cross-question, if such a conductor is heated to incandescence in an electric lamp, what part of the conductor produces the light?

A. As the light from an incandescent conductor is all given off at its surface, and as the experiments which my experience has tried have shown that the treatment of an incandescent conductor in a hydrocarbon bath deposits carbon from the hydrocarbon 3232 on its surface and in the interstices, I believe that all the light would be radiated from the deposited carbon.

Counsel for Edison rests his examination of this witness here, and offers him for cross-examination.

Cross-examination by AMOS BROADNAX, Esq., counsel for Sawyer and Man:

45 X Q. The papers you say you carbonized in pieces of gas tube in the summer of 1876; please to state in detail just how you carbonized the paper in the gas tubes?

A. A piece of tube was taken, such as is for gas pipes. To the best of my recollection from five to six inches long, and having about three-quarters to an inch hole in it. A thread was cut on each end of this and a screw-cap fitted on each end. One end of this tube was completely closed by the cap being fitted tight on it. The other screwed on and off easily. The strips of paper that were carbonized in this tube were cut into lengths, and put lengthwise in the tube, in which some powdered charcoal had been placed and the tube was then packed full of powdered charcoal. In screwing the cap onto this we generally put a little moist clay on the thread to make it air tight. There was more than one tube made for this purpose. I remember one smaller than this. I cannot give the exact size of the smaller one, but believe it was a piece of three-eighths pipe.

46 X Q. How many pieces of your piping did you have fitted in that way for carbonizing paper?

A. I can only call to mind at present the two mentioned.

47 X Q. What kinds of paper did you carbonize in these tubes?

A. Principally stiff papers, such as bristol-board. We also carbonized other kinds of papers, but I do not know that they were carbonized in these tubes.

3233 48 X Q. How much paper did you carbonize in these tubes?

A. I cannot say how much paper was carbonized in these tubes, as all the work that I did on this carbonizing was generally done at night. Mr. Edison and Mr. Adams being there in the daytime also carbonized, I presume, with the same tubes.

49 X Q. How did you heat the tubes?

A. We put them into a common fire and heated them red hot, and allowed them to cool again before taking the carbons out.

50 X Q. How long did you keep them red hot before taking them out of the fire?

A. I cannot say just how long; sometimes two or three hours. In some of my experiments I took them out of the fire red hot, and covered them up with ashes, so that they would take a long time to cool off.

51 X Q. These paper carbons that were made in the gas tubes, how long were they, how wide, and how thick after being carbonized?

A. I do not remember that we cut them any particular size. The ones that I carbonized were generally about 3½ to 4 inches long, about ⅜ of an inch wide, and the thickness of ordinary bristol-board. I do not believe that I ever measured this bristol-board for thickness, but believe it was about the thickness of an ordinary visiting card. This was the size, as near as I can recollect, when they were put in.

52 X Q. How many pieces of paper did you put in at one time?

A. I put in no specified number each time, but I believe I sometimes had as many as six in the large one.

53 X Q. What were these paper carbons used for?

A. As far as I was concerned, they were specimens of carbonizing. Mr. Edison and Mr. Adams, I believe, tested them for resistance, and used them as such. I do not remember making any instrument myself in which these were used as resistances.

3234 54 X Q. Did you see Mr. Edison use them as resistances in any instrument, and if so, what instrument?

A. I had seen Mr. Edison testing their resistance with a Bradley galvanometer. Previous to this I had made for Mr. Edison resistances of powdered carbon, also resistances of plumbago on wood. At the time of these carbonizing experiments the majority of my time was taken up in New York, and the experimenting that I did on this was at night.

55 X Q. I asked you if you had seen Mr. Edison use any of the carbons carbonized in the gas tube as resistances in any instrument, and if so, what instrument?

A. I simply saw him measure one or two of these carbons, and in those cases they were resistances in an instrument when being measured.

56 X Q. Well, what instrument were they used in?

A. The Bradley galvanometer.

57 X Q. Did you see them used in any other machine; if so, what?

A. I do not remember seeing him use them as special resistances for other experiments, but know that they were carbonized with a view towards getting carbons for resistances, as I believe that was one of the things we proposed to give to the Novelty Company.

58 X Q. Was any practical use made of these carbons, and if so, what? I am referring to the carbons made in the gas tubes, all the time.

A. I do not remember that there was any practical use made of these special carbons, as the experiments were never carried far enough to make an instrument from them suitable for the Novelty Company to sell.

59 X Q. Did you undertake these experiments in carbonizing paper in the gas tubes upon the request of Mr. Edison?

A. I did, although I was not working at them all my time. I believe*d* Mr. Adams carbonized and carried on the experiments more than I did.

3235 60 X Q. But you initiated the experiments, as I understand you?

A. No, sir. Mr. Edison commenced the experiments, and we simply helped to carry them out. If I remember right, the stoppage of the Novelty Company for want of funds stopped these experiments for them.

61 X Q. When you undertook these experiments, or commenced to assist Mr. Edison in making them, did he explain to you his object in carbonizing paper?

A. I believe I remember that in conversation with myself and Adams, on the things that should be given to the Novelty Company, when he mentioned the different articles to be made from carbon, he then said that we could get any resistance we wanted from paper carbonized. We had been using previous to that, resistances for cable work which had been made of carbon, but which did not keep their resistances well, as they were made from powdered carbon packed in tubes. A cheap and high-resistance carbon was a desideratum for cable experiments, if it could be made constant. This, I believe, was Mr. Edison's idea when he proposed to have the Novelty Company sell resistances which were made of carbonized paper.

62 X Q. These paper carbons which you say you made with a gas tube, were any of them considered commercially salable for the purposes you have mentioned?

A. As the experiments were never carried to such an extent that we had a standard instrument made of these carbonized-paper strips, I do not consider that they were a commercially salable article.

63 X Q. Can you produce any of the carbonized paper made by you in the gas tubes in the experiments about which you have testified?

A. I cannot; to my knowledge for a year or so after these carbonizing experiments, I believe, there were some of these strips carbonized in gas tubes lying around the laboratory, but I cannot say whether there are any there now.

3236 64 X Q. Have you, upon your examination-in-chief, produced any specimens of carbonized paper made in a gas tube similar to those about which you have testified?

A. I have produced and put in evidence strips of carbon paper which have been carbonized in substantially the same manner as those described as being carbonized in a gas tube. These strips, however, were carbonized in a small iron box with the cover luted on, and not screwed on as in the tube experiments. This was heated in a boiler fire. This method is substantially the same as the gas-tube experiments.

65 X Q. Which one of the exhibits contains the carbons referred to in your last answer?

A. That marked Edison's Exhibit No. 22.

66 X Q. What kind of papers are these carbons made of—Exhibit 22?

A. These paper carbons are made from what is known as bristol-board.

67 X Q. And they were made in an iron box and not in a section of gas tube, as I understand you?

A. Yes, as I had not a section of the gas tube. A section of the gas tube would probably have made me a more perfect carbon, as the screwing of the cover on is less likely to allow air into the chamber than the mere luting of it up.

68 X Q. How big was the box in which you made the carbons, Exhibit 22?

A. The box was somewhere about five inches long, about two inches wide, but about four inches deep. The box was filled to within an inch of the top with powdered charcoal previous to my putting these card-board strips in. I used thisbox simply because I had it. If I had had to make a box, I should have preferred the gas tube, in order to make the experiment the same as in 1876.

69 X Q. How many paper slips did you put into the box when you made this Exhibit 22.

3237 A. I did not count the number of paper carbons in the exhibit, but I think they are all there that I put in, in the form of paper.

70 X Q. Then these were all made at once, as I understand you?

A. Yes.

71 X Q. After you had the strips of paper put in the box on the pulverized carbon, did you cover the strips with pulverized carbon also?

A. Yes, sir; pressing down the carbon so as to get in as much as possible and as tight as possible.

72 X Q. Did the lid of the box screw down on it, or how was it fastened on?

A. The box lid had a projection on its under surface that extended into the box about an eighth of an inch. We took moistened clay and plastered all around the projection, and then pressed it to its place carefully. The moistened clay filled the crevice all around the box. It was not screwed or otherwise fastened down.

73 X Q. Was the lid of the box held simply by the clay?

A. The lid of the box does not depend on the clay to be held, as we kept it in one position, and it stayed there by its own weight.

74 X Q. Then as I understand you, the only pressure there was upon the powdered charcoal and the strips of paper in the box was that due to the weight of the lid of the box.

A. Yes.

75 X Q. In making these carbons, Exhibit 22, was it your intention to show just the quality of paper carbons you made in the gas tubes in the summer of 1876?

A. My intention was to show paper carbons made in a similar manner, and with the same material, as those we made in the summer of 1876 in the gas tube.

76 X Q. Why didn't you make them in exactly the same way that you did in 1876?

A. I should have done so if I had time.

3238 77 X Q. When did you make these, Exhibit 22?

A. Early this morning, between half-past twelve and three o'clock.

78 X Q. For the purpose of this examination?

A. Yes, sir.

79 X Q. How do these carbons, Exhibit 22, compare in quality with those you made in the gas tube in the summer of 1876?

A. I can only tell from their appearance. As near as I can recollect, they are very similar in appearance.

80 X Q. Were those you made in the gas tube as entirely unbroken as these are?

A. As far as I can remember, they were as unbroken as these.

81 X Q. Now, that we have got through with the carbons made in the gas tube, and the carbons of Exhibit 22, I call your attention to the sheets of paper carbon you made in an old cast-iron box that was laying around the laboratory in 1876. Please to give the several dimensions of that box, as near as you can recollect them.

A. As near as I can recollect, the size of the box named was about five inches in diameter, and about two inches deep; the box was circular; there was no regular cover to this box, but we used a piece of sheet iron.

82 X Q. How large were the sheets of paper that you carbonized in that box, and what kind of paper was it?

A. I remember only two kinds of paper that I ever carbonized in that box myself, and they were tissue paper and card-board. I believe many other kinds were carbonized, but do not remember doing it myself. The size of the sheets, I should judge, was not more than about three inches by two, or thereabouts.

83 X Q. What you believe is not evidence. Please to confine yourself to what you know and what you remember, and
3239 state, if you please, how you charged the box, and how much
paper you put in in each charge, and how often you charged it.

A. It is impossible for me to remember at this late date, without anything to refresh my memory, exactly how many times I charged the box, or how many papers I put in each box, or in what way I charged each box. I can only say that the experiments I tried for Mr. Edison with this particular box were those in which he required me to get a flat paper carbon after carbonization. The box sometimes had the bottom covered with powdered charcoal, and then a paper sheet. Afterward another layer of powdered charcoal, and then another paper sheet. This was continued for a number of sheets in some experiments. In other experiments fewer sheets were put in and a weight of iron placed on the top to keep them straight.

I tried a number of devices and finally succeeded in bringing out flat carbons by putting a heavy weight on top of the successive layers of card-board and powdered charcoal.

84 X Q. Having the box thus charged, and forced down by a weight, in what kind of furnace did you heat it?

A. Sometimes it was heated in a stove; at other times in a small boiler furnace.

85 X Q. Were the carbons thus made straight flat sheets, or were they more or less crooked.

A. The carbons in some of the experiments were exceedingly crooked. The problem was, with me, how to make them come out straight. I succeeded in this by putting heavy weights on them, and leaving the weights on until they were cold.

86 X Q. And then were the carbon sheets whole, or were they more or less fractured?

A. There was no difficulty, that I remember, with the breaking of the carbons. Sometimes some would be broken in taking them out.

3240 87 X Q. What proportion of all the carbons which you made in this box were straight and perfect?

A. Only a small proportion of the carbons that I made myself in this box were straight and unbroken, but when I left off experimenting with that box I could bring out almost all the papers I put in as straight and perfect carbons.

88 X Q. And was this perfection of the carbons referred to by you, in your last answer, due, in your opinion, to a sufficient weight upon them, and to uniform heating and cooling of them?

A. When I spoke of the perfection of the carbon in that last answer, I meant its perfection of form and shape unbroken. There was no effort at uniformity on my part at that time to get uniform heating other than from an ordinary fire, but I frequently endeavored to get uniformity of cooling by covering it over with the ashes of the grate.

89 X Q. These sheets of paper carbon that you at last succeeded in getting straight and whole, of what kind of paper were they made?

A. I believe principally of ordinary card-board.

90 X Q. Card-board is of various thicknesses. State about how thick the card-board was that you used to make these carbons, as near as you can recollect.

A. About the thickness of an ordinary visiting card.

91 X Q. What use did Mr. Edison make of these sheets of carbon you made in this box in 1876?

A. I do not remember any use that they were put to, as well as I can remember, the flatness of the carbons was requisite for making carbons for batteries, and in order to make the generality of battery carbons we should have to have larger molds and larger sheets; the experiments I remember, resulted merely in getting flat sheets of carbon from paper.

92 X Q. Can you produce any specimens of the carbons made in this box in 1876?

A. I cannot; I have looked in Edison's laboratory
3241 & 3242 for some specimens of these paper carbons, but although I can find plenty of carbonized paper, I could not bring any here that I could swear was carbonized by us in 1876.

93 X Q. Have you produced here to-day any specimen of carbonized paper intended to show the quality of the carbonized paper you made in that box in 1876, other than these contained in Exhibit 22?

A. Yes, sir; I have put in evidence here some carbonized tissue sheets which are marked Edison's Exhibit 21, which are substantially similar to some tissue sheets that I carbonized in the iron box in 1876.

By consent the taking of further testimony was postponed to Saturday, July 9, 1881, at 10 o'clock a. m.

WM. H. MEADOWCROFT,
Notary Public, New York County.

Pursuant to adjournment this examination was continued on Saturday, July 9th, 1881, at 10 o'clock a. m., same counsel being present.

94 X Q. Are these carbons of Exhibit 21 carbonized in the same box that the carbons of Exhibit 22 were carbonized in, and in the same way and at the same time?

A. They were carbonized in the same box but not at the same time; they were carbonized in the same manner, between eleven o'clock the night of July 7th, and three o'clock the morning of July 8th, 1881.

95 X Q. Are these carbons of Exhibit 21 suitable carbons out of which to make illuminating conductors for Mr. Edison's incandescent lamp?

A. No, sir.

96 X Q. The same question as to the carbons of Exhibit 22?

A. I cannot say, as I have not tried them.

97 X Q. What is your opinion about it?

3243 A. My opinion is that the carbons in Exhibit 22, if used as incandescent conductors in an electric lamp, would answer that purpose, as the carbonizing we do now for Edison's electric lamps is no different in principal from the way in which we carbonized the strips in 1876.

98 X Q. What time in the year 1876 did you commence these experiments of carbonizing paper, about which you have been testifying?

A. I cannot give the exact date, as I have no memoranda to refresh my memory; the particular year 1876, I remember, as during that year I spent a great part of my time in New York selling and perfecting the manufacture of Edison's electric pen; it was about the time of the organization of the Novelty Company.

99 X Q. At the time these experiments were made, what reference did they have to electric lighting?

A. I know of none.

100 X Q. Referring now to the exhibit marked Edison's First Incandescent Lamp, please to state whether the lamp is now in same condition it was when you made the experiment in it about which you have testified?

A. As far as I can see, it is in the same condition as when I put the paper carbons in for Mr. Edison.

101 X Q. These experiments, as I understand you, with this lamp, were undertaken by you at the request of Mr. Edison in the latter part of the summer or the early part of the fall of 1877?

A. Yes, sir.

102 X Q. When Mr. Edison requested you to undertake these experiments, what did he say to you?

A. As near as I can recollect, his words were, "Batch., put me a piece of carbon in this," and I believe he brought the globe to me at the time.

103 X Q. Is that all he said to you upon the subject of the experiment at the time—did he say nothing about the object of the experiment?

A. At that particular time that was all that I remember; 3244 but when I had finished the instrument, and was making a thin carbon to put in, and he saw the difficulty I had to get it thin enough, he suggested to me to cut the carbon from some of the carbonized paper that was lying around. I do not remember that he said anything to me at that time about the object of the experiment. It was quite apparent to me what he wanted to do.

104 X Q. When did he first say anything to you about the object of the experiment?

A. I cannot call to mind the first time he spoke of the object of this experiment.

105 X Q. State the first time you recollect of his speaking to you about it, and state what he said?

A. I cannot give any particular time when he spoke of the object of this experiment. At the time this experiment was made my time was not wholly devoted to experimenting on electric lighting, and the experiment only occupied my mind for a short time, as I had to make it for him. It was a frequent occurrence for me to break off experimenting on one thing to make an instrument to illustrate some idea of Mr. Edison's.

106 X Q. After you succeeded in getting the carbon in this lamp, to what degree of illuminosity did you succeed in raising it?

A. I cannot tell the exact degree; I remember Mr. Edison and Adams made the experiment with it, and I remember that they all came to incandescence before oxidizing or bursting.

107 X Q. How long were they maintained in a state of incandescence before they were destroyed?

A. I cannot say, but they lasted a very short time.

108 X Q. Well, about how long?

A. None of them, I believe, lasted more than from ten to fifteen minutes.

109 X Q. Did you see these experiments yourself?

A. I was present and saw them, but did not direct the ex-
3245 periments, Mr. Edison doing that himself, as my mind was
not on that. I was simply curious to see the result, and
did see it.

110 X Q. Then you can tell me whether the carbon was raised to a red heat, to a yellowish heat, or to a white heat. Give me, as near *at* you can, the degree of luminosity or color of the carbon that was obtained in those experiments.

A. In those experiments the carbons were raised through the red and yellow to a white heat, and generally before bursting gave a very brilliant light. The degree of luminosity I cannot say.

111 X Q. How many carbons were put in this experimental lamp?

A. I cannot say the exact number, but am sure there were more than two. I could not swear to there being more than six or seven.

112 X Q. All that was put in, as I understand you, you put in?

A. Yes, sir; as far as I know.

113 X Q. How large were the carbons—give their several dimensions, as near as you can recollect?

A. I cannot give their dimensions exactly, but I remember the first one was the widest; their lengths, as near as I remember, were about alike, and their thickness. I do not believe that any of these carbons were more than an inch long or less than ¾ of an inch. Their width was not more than ¼ of an inch nor less than $\frac{1}{32}$ of an inch, and their thickness, as near as I can judge, without anything to refresh my memory, would be in the neighborhood of from seven to ten thousandths of an inch. As I did not carbonize these especially for the purpose, but cut them from already carbonized sheets, this measurement is as near as I can get.

114 X Q. What degree of vacuum did you obtain in the glass chamber or globe of this lamp in which you illuminated a carbon?

A. That I cannot tell; but I know that the vacuum pump, on
the platen of which this was exhausted, will not, under any
3246 circumstances, give a state of exhaustion which I should call
a good vacuum now. At that time, I believe t*k*ey pumped
until they could see no diminution in the column of mercury, and
then stopped.

115 X Q. When Mr. Edison saw the carbons illuminated in this

experimental lamp, and saw them go out, or destroyed by the current, as you have stated, what did he say?

A. I cannot remember what he said, with the exception theat he wanted another one in, and I proceeded immediately to put one in. My attention was taken with this, and I cannot remember what he said at the time, or whether he said anything further than expressing a wish to have another put in.

116 X Q. After he saw the last one burn and go out what did he say?

A. I cannot remember at this time that he said anything in particular.

117 X Q. Didn't make any remarks about the experiments at all?

A. I cannot remember that he made any at all at that time.

118 X Q. Why did he undertake the experiments?

A. Because his mind was running on experimenting with electric light as one of the after things of the telephone; for many months during our experimenting with that telephone, and before my time was devoted entirely to the light.

119 X Q. What did he undertake to prove by these particular experiments?

A. He did not undertake to prove anything to me about them. I knew from these experiments that he had me try what his object was to do; they needed no explanation.

120 X Q. How did you know what his object was?

A. I knew that he thought some on electric lighting. I saw him
for a day or two working at a table near my table experimenting
with a battery and pieces of material in between the electrodes,
and I knew, without being told, that he was experimenting
3247 in electric lighting. Paper carbons were part of the same
series of experiments, and he gave them to me because I was
more used to doing work of that kind than he was, or at least I suppose so. My principal time, and almost all my energy at that time, was on telephones.

121 X Q. Then, as I understand you, you ascertained what Mr. Edison's object was in making the experiments with this exhibit, Edison's First Incandescent Lamp, by what you saw him do, and not by what you heard him say?

A. Yes, sir; by what I saw him do, and what he had me do.

122 X Q. Now, what did you see him do, and what did he have you do, that showed you the object of his experiments?

A. As I said before, I saw him experimenting on electric lighting. He had me put paper carbons in the lamp marked Edison's First In*d*candescent Lamp, and I saw from that, that in this case, he wanted to make an incandescent electric lamp, in which the incandescent material was carbonized paper *in vacuo*.

123 X Q. And that, as I understand you, is all that you saw him do and all that you done, that led you to that conclusion?

A. Yes, sir; that was all that was needed to lead me to that conclusion. I afterwards saw him raise these carbons to incandescence in a vacuum proving to me that such was the case.

124 X Q. When did you see him raise the carbons to incandes-

cence in the vacuum afterwards; was it at the time of these experiments or afterward?

A. Immediately on my giving him the lamp with each paper carbon fixed in place.

125 X Q. Then, from the facts and circumstances which you have related, you inferred, as I understand you, that Mr. Edison's object was to make an incandescent lamp, in which the illuminating conductor should be of carbonized paper?

A. Yes, sir.

3248 126 X Q. How well did Mr. Edison accomplish this object at that time?

A. The lamp was complete, and gave light for a short time. It was not a commercial success. As a lamp for a few minutes it was a success.

127 X Q. If that was Mr. Edison's object in making those experiments why did he tell you first to put hard carbon in the lamp, and then when he saw how much trouble it was to get in the hard carbon, direct you to put in strips of paper carbon?

A. I do not know why he told me to put in the paper carbon, except that I knew he did so.

128 X Q. Now, in putting this carbon in this lamp, I understand you to say that you screwed the glass globe off of the pedestal, in which the cock is placed below the globe?

A. Yes, sir.

129 X Q. That you screwed the ball off of the top of the stem?

A. Yes, sir.

130 X Q. And the gland off of the stuffing box?

A. Yes, sir.

131 X Q. And took the packing out of the stuffing box?

A. Yes.

132 X Q. And made the clamps on the end of the rod that forms the conductor in the chamber of the lamp?

A. Yes, sir.

133 X Q. That you took the piece of carbon and fastened it in the clamps?

A. Yes.

134 X Q. That you then screwed the lower end of the conductor in the top of the pedestal in which the cock is placed under the globe of the lamp?

A. I either screwed it in there or fastened it in tightly.

3249 135 X Q. You then passed the whole conductor up through the bottom of the globe, the upper end of the conductor passing up through the stuffing box, the globe being turned right upside down.

A. Yes.

136 X Q. You then, while the globe of the lamp was in an inverted position, screwed the pedestal in which the cock is placed in the bottom of the globe?

A. Yes.

137 X Q. Then put the packing in and screwed in the gland?

A. Yes, sir.

138 X Q. Now, after you had got the carbon in the lamp, and the lamp together in that way, how did you exhaust the air out of the globe?

A. This was done by an ordinary air pump; the base of this lamp, being true, was placed right over the exhausting hole on the platen, and the air drawn out of the lamp; this, I believe was done by Adams.

139 X Q. How could the air be drawn out of the globe of the lamp unless there was an open passage between the air pump and the globe of the lamp?

A. You will find that there is such a passage in the inside of the lamp, I believe where the screw is driven in.

140 X Q. On an examination of the lamp I do not find any such passage; please to point it out.

A. You will find there are two small grooves, one on each side of the rod of brass, through which, if the grease was cleaned out of the lamp, you would be able to suck air.

141 X Q. When were these experiments with the Exhibit Edison's First Incandescent Lamp concluded?

A. They only lasted a few days altogether with this particular lamp, in the end of the summer or beginning of the fall of 1877.

142 X Q. Did you experiment with any other lamps at that time?

A. I do not recall to my mind making any more lamps for Mr. Edison about that time.

3250 143 X Q. I read to you your answer in examination-in-chief to question 26.

(Counsel reads question and answer.)

Were all the carbons that were then illuminated—I mean at the time referred to in your answer which I have just read—illuminated in the bell receiver of the air pump, or did you then have at that time, in the fall of 1878, a lamp made having a glass chamber from which the air was exhausted, and into which you put these carbons to illuminate them?

A. As far as I remember, they were all illuminated in one of the bell jars belonging to the pump.

144 X Q. What was the shape of these carbons?

A. They were as near as we could get them to short, straight sticks.

145 X Q. Did you experiment with other carbons besides paper carbons at the same time?

A. Yes, sir; during the same series of experiments.

146 X Q. How long did that series of experiments last, and when was it concluded, as near as you can recollect?

A. I cannot say just what time I gave over experimenting myself on these; probably about the end of September, 1878.

147 X Q. After you concluded your experiments in the fall of 1878 with the carbonized paper in the bell jar of the air pump, when did you next use carbonized paper for illuminating in an electric lamp?

A. Shortly after the experiments referred to, Mr. Edison used some of these carbons in the electric lamp Exhibit No. 15.

148 X Q. Was that a sealed lamp in which the carbons burned *in vacuo* or in an inert gas?

A. No, sir; the carbons burnt in the atmosphere.

149 X Q. When did you next use carbonized paper for illuminating in a sealed electric lamp, out of which the air had been 3251 exhausted, after you had completed your experiments in the fall of 1878—I mean the experiments in the bell jar of the air pump.

A. About the middle of October, 1879, within a day or so of the time that the first of the style of lamp of which Edison's Exhibit Commercial Incandescent Lamp is one, was made.

150 X Q. In that case, as I understand you, the carbon was substantially of the form of that shown in the Exhibit Edison's Commercial Incandescent Electric Lamp, and the lamp was made for the purpose of burning an incandescent conductor of carbonized paper, or something substantially the same as carbonized paper?

A. It was substantially the same with this exception, that, I remember, the first loop that was cut, was cut straight and bent round when put into the carbonizing chamber. The lamp was made for the purpose of a lamp; with the exception that I have mentioned the lamp was similar to this exhibit.

151 X Q. When did you first cut the paper of the form substantially shown in the Exhibit Edison's Commercial Incandescent Lamp before carbonizing?

A. I believe I cut them during October, 1879. My impression is between the 20th and 25th. I think I could find the record somewhere amongst our books, to that effect.

152 X Q. Then, as I understand you, the first sealed incandescent electric lamp or lamps that Mr. Edison made or caused to be made, as a lamp, in which he used carbonized paper for the illuminating conductor, was made in October, 1879?

A. With the exception of the Exhibit Edison's First Incandescent Lamp, and the experiments I have mentioned in the bell jar of an air pump, the lamp made in October, 1879, was the first lamp which answers the conditions of your question.

153 X Q. Referring now to Exhibit No. 16, please to describe exactly how you carbonized that paper, and what kind of blotting paper you used?

3252 A. The Exhibit 16 is ordinary blotting paper similar to that which I now put in the box with Exhibit 16 and mark in ink with my initials. These sheets were carbonized in the same box that I have spoken of as being one in which Exhibits 21 and 22 were made. The paper was put in the box, tightly packed with powdered charcoal between each sheet. They were made to show what kind of carbon ordinary blotting paper makes when carbonized, substantially the same as is spoken of in Mr. Man's testimony.

154 X Q. How did you fasten the lid down on the box in this case, the same as in the other case?

A. I did not fasten the lid down by wire, as spoken of in one of Mr. Man's statements, as the lid of my box has a projection going inside the box.

155 X Q. Was there any pressure upon the paper during the operation of carbonization?

A. None except the weight of the lid.

156 X Q. Was the full weight of the lid upon the paper?

A. No, sir; the lid rested on the tightly packed powdered carbon. The papers were some distance from the surface.

157 X Q. Did you saturate the paper with any carbonaceous material, put it in a hydraulic press and press it hard before carbonizing?

A. I did not saturate this exhibit with anything, nor did I press it. I however, pressed a piece of the botting paper under a powerful screw-press, and carbonized that. I did not, however, saturate this with anything. I have produced this and it is here, marked Edison's Exhibit No. 17. I made these to show the kind of carbon that blotting paper made, whether pressed or in its ordinary state.

158 X Q. What experience, if any, have you had in treating paper carbons electrically, in the presence of hydrocarbon gas?

Question objected to as being new matter, not brought out upon examination-in-chief.

3253 A. I have had considerable experience in treating carbonized paper used as an incandescent conductor in hydrocarbon vapor in connection with the paper-carbon loops of Edison's electric lamp.

159 X Q. What effect does such treatment have upon the paper-carbon burner?

A. It deposits carbon from the hydrocarbon on the surface of the incandescent conductor.

160 X Q. Doesn't it fill up the interstices and consolidate the carbon—making it finer and more compact?

A. It probably does fill up the little interstices on the surface, but I do not think it makes the paper carbon any more compact. It adds to that by coating on the surface. I have frequently broken these conductors that have been treated in the vapor of the hydrocarbon, and, under a powerful microscope, have found that the fracture of the paper carbon showed no greater density, and the deposited carbon sticking to it in the shape of small needles stuck endwise on it.

161 X Q. In the presence of what kind of hydrocarbon gas did you treat the carbon; how high did you raise its temperature or luminosity?

A. In our experiments we have generally used the vapor gasoline, benzine and such vapors. The carbons were raised to different temperatures, but were always raised to brilliant incandescence when we were depositing this carbon.

162 X Q. Under what pressure of the gas did you treat the carbon?

A. I do not know what pressure we had. The chambers that I had made for our experiments in the experiments I speak of, always had a small outlet, so that the vapor could escape, and we made it while the experiment was going on. We did not create an artificial pressure for the purpose of treating carbon under pressure. If there was any pressure at all, it was an incidental pressure, while we were making the gas.

163 X Q. How large were the carbons you treated?

3254 A. Some of the carbons were the same as the one in Exhibit Edison's Commercial Incandescent Electric Lamp. The other carbons were about the same size, but made from different fibres.

Redirect examination by GEORGE W. DYER, counsel for Edison:

164 Q. Do you wish to explain your testimony in regard to first putting carbons into the lamp, Exhibit Edison's First Incandescent Lamp, if so, please make your explanation.

A. Yes; in my direct testimony I testified that Edison wanted a hard carbon put in that lamp, so that it reads as if he requested that it should be specially hard carbon. I could not swear that he especially wanted a hard carbon, but that he told me, as I have afterwards stated, to put a carbon in the lamp, and I proceeded at that time to put a hard carbon in, supposing that was what he wanted.

165 Q. Referring to your answer in cross-examination about the Exhibit First Incandescent Lamp, state, if you remember, how long before the experiments with the lamp was the lamp made, as a lamp?

Question objected to, and all testimony appertaining to the alleged lamp—Edison's first incandescent lamp—as tending to prove that the invention was made before the date alleged in the preliminary statement; because the question assumes that the so-called lamp was ever made for a lamp.

A. The lamp was used as a lamp within a day of its being made as a lamp.

166 Q. At the time of these experiments with this exhibit, do you wish to be understood that the only conversation Mr. Edison had with you in regard to electric lighting by incandescence was the direction to put a carbon in that lamp?

3255 A. Previous to that time, and after that time, Mr. Edison had frequently spoken of electric lighting for domestic purposes as a big field for experiment when we had the telephone and some other things off our hands. He frequently tried experiments himself whilst we were working on these other things. He knew that I was conversant with the experiments and the end they tended towards, and therefore his order to me to put the carbon in—that needed no further explanation from him as to what he proposed to do.

CHAS. BATCHELOR.

3256 By consent, the taking of testimony was postponed to Wednesday, July 13th, 1881, at same place, at ten o'clock a. m.

WM. H. MEADOWCROFT.
Notary Public, N. Y. Co.

Parties met, pursuant to adjournment, on Wednesday, July 13th, 1881, and adjourned by consent to Saturday, July 16th, 1881, at 10 o'clock a m., at same place.

WM. H. MEADOWCROFT,
Notary Public, N. Y. Co.

Parties met, pursuant to adjournment, on Saturday, July 16th, 1881, and adjourned by consent to Wednesday, July 20th, 1881, at 10 a. m., at same place.

WM. H. MEADOWCROFF,
Notary Public, N. Y. Co.

3257 Pursuant to adjournment, this testimony was continued Wednesday, July 20th, 1881, at 10 a. m., same counsel being present.

STEPHEN D. FIELD, a witness produced in behalf of Mr. Edison, being duly sworn, testified as follows, in answer to questions proposed to him by GEORGE W. DYER, counsel for Edison:

1 Q. Please state your name, age, residence and occupation.

A. Stephen Dudley Field; 35 years old; residence, New York; occupation, electrical engineer.

2 Q. Please state whether or not you visited Mr. Edison at Menlo Park, in 1877, and if so, at what time during that year?

A. I visited Mr. Edison's place during the summer of 1877. To the best of my recollection it was the middle or latter part of the month of August.

3 Q. When at Menlo Park, at the time named, did you see Mr. Edison perform any experiments in incandescent electric lighting, and if so, please state what the experiments were?

Question objected to as going to prove that the invention was made before the date alleged in the preliminary statement of Mr. Edison and notice of motion to strike it out at the hearing.

A. I went there at Mr. Edison's invitation to witness experiments in incandescent lighting. The experiment consisted in the heating, by means of a bichromate battery of small crystals, of what Mr. Edison called silicon, said crystals being supported between carbon clamps.

4 Q. Please examine exhibits marked Edison's Exhibit No. 4 and No. 13, already in testimony in this case, and state whether 3258 or not these exhibits indicate substantially the character of the experiments which you then witnessed?

Objected to as immaterial and incompetent. Notice of motion to strike out.

A. The experiments which I witnessed are indicated in figures 1 and 2 of Exhibit 4, and the middle and lower figures of Exhibit No. 13. The exception being that the source of power in the experiments was a bichromate battery in place of magneto machines, as shown in the exhibit.

5 Q. During that visit to Mr. Edison, did he explain to you what he had previously done in incandescent electric lighting, and if so, what explanation or information did he give?

Same objection and same notice.

A. My recollection is that he stated that this use of silicon he hoped would give him an inexidizable agent for a burner, and thereby greatly simplify the problem of incandescent lighting. Beyond that I have no recollection of any conversation between us, except he referred to a note book which he showed me, wherein he had first discovered the incandescent properties of silicon.

6 Q. Do you recollect whether or not Mr. Edison spoke of materials for incandescent conductors, which had been previously tried by him and found to be oxidizable?

Same objection and same notice.

A. My recollection is that we had a general conversation on the subject, the details of which have, however, almost entirely escaped my memory.

7 Q. Who was present during these experiments you have mentioned, besides yourself and Mr. Edison?

Same objections.

3259 A. Dr. Cornelius Herz, now in Paris, and Mr. Batchelor, I believe, and one or two of Mr. Edison's assistants.

Counsel for Edison gives notice that he here closes his examination of this witness, and offers him for cross-examination.

No cross-examination.

STEPHEN D. FIELD.

3260 THOMAS B. STILLMAN, a witness produced in behalf of Mr. Edison, being duly sworn, testifies as follows in answer to questions proposed by GEORGE W. DYER, counsel for Edison:

1 Q. Please state your name, age, residence and occupation.

A. Thomas B. Stillman; 29 years old; residence, Plainfield, N. J.; occupation, analytical chemist and assayer.

2 Q. Please state whether or not you are acquainted with William E. Sawyer, the electrician.

A. I am.

3 Q. Please examine the paper I now show you, marked Edison's Exhibit No. 8, and state whether or not you read the same soon after its publication in the newspapers.

Objected to as immaterial.

A. I have examined the paper shown me; I read it; it might have been one month, but not later than three months after its publication.

4 Q. Did you ever hear William E. Sawyer speak of the authorship of that article marked Edison's Exhibit No. 8.

Same objection.

A. I have.

5 Q. How often have you heard him so speak?

A. Once, certainly and I think twice.

6 Q. Repeat what he said as nearly as you can remember it.

Objected to as incompetent and immaterial.

A. I can't state what he said; he called my attention to the article, and asked me if I had read it. I said, "No." I then read it.

7 Q. How did he speak of it—as his article?

Objected to as leading.

3261 A. I can't say that he did. My impression is he said "my challenge."

8 Q. Do you remember what he said when he asked you to read the article?

A. I don't recollect any more than what I have said, positively.

9 Q. Have you heard the article referred to in his presence as his article?

Objected to as incompetent.

A. Not in those words as coming from him, but the impression derived from what he said led me to think he wrote the article.

10 Q. Have you heard the article referred to in his presence as his challenge, or as Sawyer's challenge to Edison?

Objected to as incompetent.

A. Not by other parties, but when Mr. Sawyer drew my attention to it as his challenge.

11 Q. Are you acquainted with Mr. William E. Sawyer's signature?

A. Yes, sir.

12 Q. Please examine the paper now shown you; state whether or not the signature, W. E. Sawyer, is in the handwriting of William E. Sawyer.

Objected to as incompetent.

A. I think it is—yes, sir.

13 Q. Have you any papers in your possession in the handwriting of William E. Sawyer, containing his signature?

Objected to as incompetent and immaterial.

A. I have.

14 [illegible] Please produce the same.

Same objection.

3265 A. I produce a note sent to me by William E. Sawyer.

The paper first mentioned is put in evidence and is marked Edison's Exhibit No. 23.

(Here follows lithograph marked pp. 3262 & 3263.)

Exhibit 23 objected to as not being shown to be in the handwriting of Mr. Sawyer, or caused to have been written by him, and as not being produced by the person to whom it is addressed; and as incompetent, irrelevant and immaterial.

Second paper referred to, being a note to the witness, is put in evidence and marked, Edison's Exhibit No. 24.

(Here follows lithograph marked p. 3264.)

Objected to as incompetent, irrelevant and immaterial.

15 Q. Please state if you find the newspaper article put in evidence, and marked Edison's Exhibit No. 23, published in the New York Sun of January 5, 1880?

Objected to as incompetent, irrelevant and immaterial; and upon the further ground that there is no proof that the paper put in evidence was January 5, 1880.

A. I find it published in the paper dated on that date, January 5, 1880.

16 Q. Also, is the paper now shown you the same extract cut out of the newspaper?

A. Yes.

Extract referred to put in evidence, and marked Edison's Exhibit No. 25.

Object- to as incompetent and no proof of anything except its own existence.

17 Q. Were you subpœnaed as a witness in this case for Mr. Edison?

A. I was.

3266 Counsel for Edison her- closes his examination of this witness and offers him for cross-examination.

Cross-examination by Amos Broadnax, Esq., counsel for Sawyer and Man:

1 X Q. When was the paper marked Exhibit 24 written?

A. I can't give the date of it.

2 X Q. How do you know this paper is in the handwriting of Mr. Sawyer?

A. It is the same handwriting I have always seen him use.

3 X Q. How often have you seen him write, if at all?

A. A number of times; I can't state exactly how many.

4 X Q. About how many?

No. 286
C. E. Light Co
v.
McK Light Co } 17. 32 62

Mr. Edison Challenged by Mr Sawyer Offer

(Ap. — Dec 6)

To the Editor of the Sun — Sir:

Edison's Exhibit
No ~~[illegible]~~ 23 W.H.M. Notary public N.Y. Co.

~~Editor Sun~~

~~78 Walker St.~~
~~New York Jan 4 1880~~

Notwithstanding the assertion that one of Mr Edison's electric lamps has been running for 240 hours I still assert, and am prepared to back up my assertion, that Mr Edison cannot run one of his lamps up to the light of a single gas-jet (to be more definite, let us call it 12 candle power) for more than three hours. To be still more definite I offer to Mr Edison, at 226 W. 54th St. in this city, an opportunity to prove what he says. From the private residence in that street, wires are run a circuit of 800 feet. Mr Edison shall have every facility; he shall use w/ Lit my wires: he shall have any dynamo machine or other generator of electricity he may prefer; and all I ask is that the power of his light shall be measured by a photometer: that, once in place, it shall not be interfered with; and that a committee of gentlemen, preferably nominated by the editors of the N.Y. press

No. 286
E. Light Co
v.
McK. Light Co } p. 3263

agate 8K

shall be present and certify to the facts of the test

Furthermore, I will place one of my lamps side by side with Mr Edison's; it shall be run at a power of 25 candles; (it shall outlast the entire 40 lamps at Menlo Park run at the power of 25 candles;) my lamp to stand as it is put up, and Mr Edison to put up a fresh lamp as fast as the preceding lamp shall have burned out.

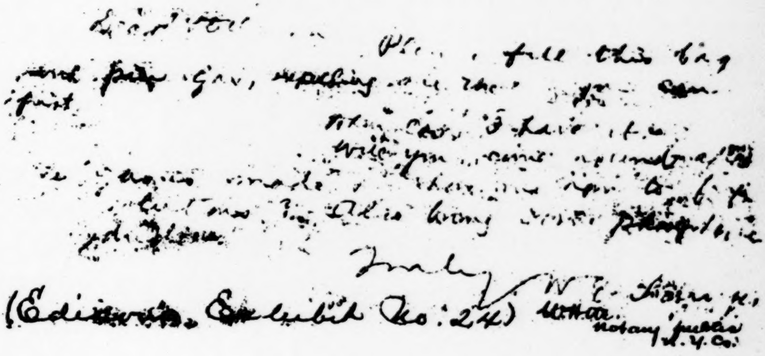
¶ I am anxious for this test; and if Mr Edison has really run one of his ~~lamp~~ horse shoe lamps 240 hours he will not refuse to accept my offer. for he will be treated with the utmost courtesy and shall have everything his own way.

I adhere in every particular to my original challenge to Mr Edison.

Respectfully
W. E. Sawyer

78 Walker Street New York Jan 4

111



Dear [illegible] — Please fill this bag
with pure gas, expelling all the [illegible] com-
pint.

[illegible] can I have it [illegible]
Will you [illegible] [illegible]
[illegible] [illegible] made [illegible] [illegible] [illegible] to [illegible]
[illegible] [illegible] this being [illegible] [illegible]
[illegible]

Truly

(Edison's Exhibit No. 24) W. C. [illegible]
[illegible]
notary public
N. Y. Co.

No. 286.
E. Light Co.
v.
McK. Light Co.
} p. 3264

A. I couldn't state about how many; I have been connected with him nearly three years.

5 X Q. Can you swear that you saw Mr. Sawyer write ten times in these three years?

A. Yes, sir.

6 Q. And use the same handwriting every time?

A. Yes, sir; with one exception when he couldn't see.

7 X Q. Did you see him write when he couldn't see?

A. I did not. He had injured his eyes by an explosion. I had a note written from him when his eyes were in that condition, where he stated that fact. That note was in a different handwriting.

8 X Q. In whose handwriting is this paper, Edison Exhibit 23?

A. I don't know; it looks like Sawyer's uncle's—Leonard Sawyer.

9 X Q. Did you see Mr. Sawyer sign this paper?

A. No, sir.

10 X Q. It's not in the handwriting of Mr. Sawyer, is it?

3267 A. No, sir.

11 X Q. Do you know whether Mr. Sawyer read it or heard it read after it was written?

A. I do not.

12 X Q. Do you know whether he dictated it?

A. I do not.

13 X Q. Is this the paper Mr. Sawyer referred to as his challenge to Mr. Edison?

A. No, sir; the paper he referred to as his challenge to Mr. Edison is Edison's Exhibit No. 8.

14 X Q. Do you know who wrote this paper Exhibit No. 8?

A. No, sir.

THOS. B. STILLMAN.

3268 William Sawyer, a witness produced in behalf of Mr. Edison, being duly sworn, testifies as follows, in answer to questions proposed to him by George W. Dyer, counsel for Edison:

1 Q. Please state your name, age, residence, and occupation.

A. Name, William Sawyer; age, 59; present location, Earle's hotel; occupation, gentleman, as near as I can act one.

2 Q. Are you the father of William E. Sawyer, the electrician?

A. Yes.

3 Q. Please examine the paper now shown you which is marked Edison's Exhibit No. 8, and state whether you read the same soon after the date of its publication?

Objected to as incompetent, irrelevant and immaterial.

A. I think I read that about the time of its publication. I couldn't swear positively that this is the same thing, but think it is virtually the same. It was a challenge.

4 Q. Did you ever hear your son, William E. Sawyer, deny being the author of this challenge?

A. No, sir; nor I never heard him acknowledge it.

Latter part of the answer objected to by counsel for Edison as not responsive.

4 Q. Have you not stated within a week that your son, William E. Sawyer, wrote this challenge before referred to?

Objected to as incompetent.

A. I may have made that remark. I couldn't say that I did not. I have no recollection of making that remark; neither will I say that this is the challenge shown me that he wrote.

3269 6 Q. Have not you stated, within a week, that you went into a certain place and found your son dictating this challenge to a messenger boy?

Objected to as also being incompetent.

A. Emphatically, no. I may have stated that I understood that he did dictate to a messenger boy and the messenger boy wrote it down as it came from his lips, but not from my personal knowledge. It was hearsay.

7 Q. From whom did you understand that William E. Sawyer dictated that challenge to a messenger boy?

A. I couldn't tell; not within my recollection.

8 Q. Did you ever hear this challenge talked over in the presence of William E. Sawyer?

A. No, sir; to the best of my recollection, I never heard the subject-matter talked over in his presence, either with myself or any other parties.

9 Q. Have you not stated within a week that you advised your son, William E. Sawyer, that he ought not to have published the challenge referred to, or so advised him at the time the challenge was being dictated?

Objected to as leading and immaterial.

A. I do not recollect of doing so.

10 Q. At what place did you understand this challenge, so called, was dictated?

A. According to the best of my recollection, he was boarding at 200 West Forty-second street at the time of this publication.

11 Q. I do not ask where he was boarding, but where, as you understand it, he was when this challenge was dictated.

Question objected to as calling for hearsay evidence, and upon the further ground that the witness has not stated that he understood the challenge to be dictated at all.

3270 A. I have answered this question before. He may, however, have been boarding at 267 instead of 200 West Forty-second street. My present impression is that it was dictated either at 200 or 267 West Forty-second street. I would not state positively to either place, as I have no means of fixing it.

12 Q. Have you not stated within a week that that challenge was dictated at the corner of Walker and Elm streets?

Objected to as grossly leading and immaterial.

A. I have no recollection of it.

13 Q. Have you any recollection of talking with any one whatever about this challenge within a week?

A. I have no recollection of it.

14 Q. You stated conversationally, a moment ago, did you not, that you were very much annoyed when you read this challenge in the newspapers?

Objected to as leading and immaterial.

A. I did so state confidentially to Mr. Dyer.

15 Q. Had you any doubt at the time of reading this challenge that it proceeded from your son, William E. Sawyer?

Objected to as leading and immaterial as to what his opinion was, or doubts upon the subject.

A. Of course, I took it for granted, as all others would, the communication being over his signature.

16 Q. Were you subpœnaed as a witness in this interference?

A. Yes.

Counsel for Edison closes his examination of this witness, and turns him over for cross-examination.

3271 Cross-examination by AMOS BROADNAX, Esq., counsel for Sawyer and Man:

17 X Q. Do you know of your own knowledge, whether your son, William E. Sawyer, wrote or dictated this article, cut from a newspaper, and marked Edison's Exhibit No. 8?

A. No.

WM. SAWYER.

3272 JAMES A. RUSSELL, a witness produced in behalf of Mr. Edison, being duly sworn, testifies as follows in answer to questions proposed to him by GEORGE W. DYER, counsel for Edison:

1 Q. Please state your name, age, residence and occupation.

A. Residence, 347 West Thirty-sixth street, New York; I am a canvasser for the Edison Electric Light Company. My name is James A. Russell, and I am 44 years of age.

2 Q. State whether or not you know Mr. William Sawyer, who has just testified as a witness in this case and in this room.

Objected to as immaterial.

A. Yes, I know him.

3 Q. State whether or not you have heard Mr. William Sawyer lately make any statements regarding the authorship of a newspaper challenge published in the New York Sun, December 22d, 1879, marked Edison's Exhibit No. 8, and if so, when and where were such statements made, and what was the statement?

Objected to as calling for mere hearsay testimony, at second or third hand, and after the witness, William Sawyer, has testified that he really didn't know anything about it.

A. On Sunday last at Earle's hotel, talking with Mr. Potter. Mr. Potter had a conversation with him about a man named William Sharpe, who had formerly said he would like to hire him as he was an expert mechanic. He said he wanted to hire him for a gentleman friend of his in Reading, Pennsylvania. This man wanted him to do some very fine work. That was his object in calling on Mr. Sawyer.

3273 Mr. Sawyer said, "Do you know how that article was written?" He said, "Ed. was drunk, and it was written by a district telegraph boy at his dictation, and he told Ed. he had made a mistake," and Ed. says, "I've done it, I've done it. They can't answer it." I don't know that he said he was drunk, but that he was a little off.

4 Q. What article was referred to in the last part of your answer?

A. The challenge, Edison's Exhibit No. 8. I want to add to my last answer that Mr. Sawyer said, "Ed. slings a nasty pen, and talks too much."

Counsel for Edison closes his examination of this witness and offers him for cross-examination.

Cross-examination by Amos Broadnax, Esq., counsel for Sawyer and Man:

5 X Q. At the time you overheard this conversation which you have related in your examination-in-chief, did Mr. Potter show Mr. Sawyer this exhibit?

A. No.

6 X Q. How did he identify the article?

A. He mentioned the fact that the article was written in the Sun just before Christmas.

7 X Q. Did he say that he saw his son dictate the article?

A. Yes.

8 X Q. How did you come to go there?

A. I went to H. Dralle, 93 Walker street, and he told me that Wm. Sawyer, Sr., could give me all the information.

9 X Q. What did you want of Mr. Sharpe?

A. I wanted some excuse to have an interview with Mr. Sawyer.

10 X Q. And the object of your interview, as I understand you, was to see what you could suck out of him about this matter?

A. Not to suck out of him, but to obtain anything I could that would benefit my employers.

JAMES A. RUSSELL.

3274 James D. Potter, a witness produced in behalf of Mr. Edison, testifies as follows, in answer to questions proposed to him by George W. Dyer, counsel for Edison:

1 Q. Please state your name, age, residence and occupation.

A. James D. Potter; age, 57; residence, 390 Manhattan avenue, Brooklyn; I am engaged in mining.

2 Q. Are you acquainted with Wm. Sawyer, who has just testified in this case and in this room?

A. I am acquainted with the gentleman who calls himself William Sawyer. I have just come in this building and did not see Mr. Sawyer here.

3 Q. Have you had a conversation with William Sawyer lately about the authorship of an article called a challenge, published in the New York Sun, December 22d, 1879, marked Edison's Exhibit No. 8, and if so, when and where did you have this conversation, and if anybody was present besides yourself and Mr. Sawyer state who was present?

Question objected to as calling for mere hearsay testimony, as contradicting the statement made by one of Mr. Edison's own witnessess.

A. It was on Sunday, July 17th, at 2 o'clock, at Earle's hotel; Mr. James A. Russell was present.

4 Q. Please state what Mr. Sawyer said in regard to the authorship of the article referred to in the former question.

A. We had a conversation in regard to a man named William Sharpe, desiring to know his locality, as I wished to hire him for a gentleman in Reading. He informed me where Sharpe could be found; said he was at Ansonia, Connecticut, employed by the Wallace Manufacturing Company. Then the conversation drifted off to electricity. He said, "Ed. was one of the best electricians in 3275 the United States." I told him I had read many articles of his son's about electricity, electric light, etc. He said, "Did you read that challenge in December, '79?" I said, "Yes, sir;" and also said "that never was answered." He replied, "He couldn't answer it." He then said, "Do you know how that was written—under what circumstances?" I said, "No, I do not." He said, "I'll tell you. Ed. got a telegraph boy to write it." He said, "He was pretty full," or "he was drunk;" one or both expressions. While he was dictating it he would fall asleep or doze off. He would wake up and ask "Where did I leave off? What did I say last?" The boy wrote the article, and that was the way he wrote it. He was writing the article when Sawyer came in. He said to him, "Ed., do you think *your* doing right?" He said, "Yes, I've done it, I've done it. They can't answer it."

JAMES D. POTTER.

Examination ended. No cross-examination.

3276 James E. O'Keeffe, a witness produced in behalf of Mr. Edison, testifies as follows in answer to questions proposed by George W. Dyer, counsel for Edison:

1 Q. Please state your name, age, residence and occupation.

A. James E. O'Keeffe of 65 Monroe street, New York; office boy to the Aldine Publishing Company; age 15.

2 Q. What were you doing before you went in the office of the Aldine Publishing Company?

A. Working in E. Daly's boat shop.

3 Q. Where before that?

A. With Matthew, Leach & Co.'s wholesale and retail tea store.

4 Q. Were you ever in the employ of the American District Telegraph Company? If so when and where?

A. In the 15th district, from May, 1879, until February, 1880.

5 Q. Look at this newspaper article I show you, which is marked Edison's Exhibit No. 8, and state what you know, if anything, about that article.

A. I remember hearing him speak about a challenge, and there was words in it that I couldn't spell and he told me how to spell them—big words.

6 Q. Did you write that article from anybody's dictation?

A. Yes, sir.

7 Q. When was it; and where was it?

A. In Dralle's lager-beer saloon, corner of Elm and Walker streets, in December, 1879, on Sunday morning.

8 Q. What did you do with the article after you wrote it from dictation?

A. I handed it back to Mr. Sawyer.

9 Q. Then what did you do with it?

A. He put it in an envelope, and I went up to the Sun office.

10 Q. Did you leave the paper at the Sun office?

3277 A. Yes, sir, and I brought back an answer.

Counsel for Edison closes his examination-in-chief of this witness, and gives him over for cross-examination.

Cross-examination by AMOS BROADNAX, counsel for Sawyer and Man:

11 X Q. Was the article you wrote from Mr. Sawyer's dictation printed in the Sun?

A. I don't know; I didn't see it.

12 X Q. Can you produce the paper that you wrote from Mr. Sawyer's dictation?

A. No, sir.

13 X Q. When did you read that paper—Edison's Exhibit 8?

A. To-day.

14 X Q. Is that the first — you read it since you wrote it from Mr. Sawyer's dictation?

A. Yes, sir.

15 X Q. Now, can you swear that this paper, Exhibit 8, is a copy of the paper that Mr. Sawyer dictated to you, as you have stated?

A. I can't say that it's all, but I know some of it is.

16 X Q. After the paper was printed, did you compare the printed paper with the paper you say you wrote from Mr. Sawyer's dictation?

A. No, sir.

17 X Q. Have you ever seen the paper that you wrote from Mr.

Sawyer's dictation, and that you took to the Sun office since you took it to the Sun office?

A. No, sir.

18 X Q. What was the answer that you brought back from the Sun office?

A. I don't know; Mr. Sawyer didn't receive the answer, but the man behind the bar. Mr. Sawyer was upstairs.

3278 19 X Q. Was Mr. Sawyer drunk when he dictated the paper to you?

A. He acted like it.

Redirect examination by GEORGE W. DYER, counsel for Edison:

20 Q. Have you ever written any other paper from dictation for anybody else?

A. Yes, sir; once before; for a man down in New street.

JAMES E. O'KEEFFE.

Counsel for Edison gives notice that the testimony in behalf of Edison closes here.

WM. H. MEADOWCROFT,
Notary Public, New York County.

3279 STATE OF NEW YORK,
City and County of New York, } *ss:*

I, William H. Meadowcroft, a notary public, within and for the city and county of New York, and State of New York, do hereby certify that the foregoing depositions of Thomas A. Edison, Martin N. Force, Edward H. Johnson, John Kruesi, Francis R. Upton, Charles Batchelor, Stephen D. Field, Thomas B. Stillman, William Sawyer, James A. Russell, James D. Potter and James E. O'Keeffe, were taken on behalf of Thomas A. Edison, in pursuance of the notice hereunto annexed, before me, at No. 65 Fifth avenue, in the city of New York, on the 10th, 11th, 13th, 14th, 15th, 16th, 17th, 18th, 27th, 28th, 29th and 30th days of June, 1881, and the 7th, 8th, 9th, 13th, 16th and 20th days of July, 1881; that each of said witnesses was by me duly sworn before the commencement of his testimony; that the testimony of the said witnesses was written out by Henry W. Seely and Richard N. Dyer, they having been, by me, duly sworn to record the same faithfully; that Amos Broadnax, Esq., representing the opposing parties, Messrs. Sawyer and Man, was present during the taking of said testimony; that said testimony was taken at No. 65 Fifth avenue, in the city of New York, and was commenced at 11 o'clock a. m. at 65 Fifth avenue aforesaid, on the 10th day of June, 1881, and was continued, pursuant to adjournment, on the 11th, 13th, 14th, 15th, 16th, 17th, 18th, 27th, 28th, 29th and 30th days of June, 1881, and the 7th, 8th, 9th, 13th, 16th and 20th days of July, 1881; and was concluded on the last-mentioned day; and that I am not connected by blood or marriage with either of said parties, nor interested directly or indirectly in the matter in controversy.

[L. S.] In testimony whereof, I have hereto set my hand and affixed my official seal at No. 65 Fifth avenue, in the said county of New York, this 21st day of July, A. D. 1881.

WM. H. MEADOWCROFT,
Notary Public, New York County.

3291 Edison's Exhibit No. 25, W. H. M., Notary Public, N. Y. Co.

Mr. Edison challenged by Mr. Sawyer.

To the Editor of the Sun.

Sir: Notwithstanding the assertion that one of Mr. Edison's electric lamps has been running for 240 hours, I still assert, and am prepared to back up my assertion, that Mr. Edison cannot run one of his lamps up to the light of a single gas jet (to be more definite, let us call it twelve-candle power) for more than three hours. To be still more definite, I offer to Mr. Edison, at 226 West Fifty-fourth street, in this city, an opportunity to prove what he says. From the private residence in that street wires are run a circuit of 1,000 feet. Mr. Edison shall have every facility; he shall use my wires; he shall have any dynamo machine or other generator of electricity he may prefer; and all I ask is that the power of his light shall be measured by a photometre; that, once in place, it shall not be interfered with; and that a committee of gentlemen, preferably nominated by the editors of the New York press, shall be present and certify to the facts of the test.

Furthermore, I will place one of my lamps side by side with Mr. Edison's; it shall be run at the power of twenty-five candles; it shall outlast the entire forty lamps at Menlo Park, run at the power of twenty-five candles; my lamp to stand as it is put up, and Mr. Edison to put up a fresh lamp as fast as the preceding lamp shall have burned out.

I am anxious for this test; and if Mr. Edison has really run one of his horseshoe lamps 240 hours he will not refuse to accept my offer, for he will be treated with the utmost courtesy, and shall have everything his own way.

I adhere in every particular to my original challenge to Mr. Edison.

W. E. SAWYER.

SAWYER AND MAN *vs.* EDISON. } Before the Examiner of Interferences.

Application of Sawyer and Man filed Jan. 9, 1880.

Application of Edison filed Dec. 11, 1879.

The invention involved in this controversy is:

"The incandescent conductor for an electric lamp formed of carbonized paper."

It appears from the testimony on both sides that carbonized paper has certain qualities which are generally considered very desirable, if not indispens*i*ble, for an incandescent conductor; but it also has defects which, if not cured, cause its destruction in such a brief period as to render it of no practical value in the system of electric lighting. It is found that carbonized paper, if used as a conductor in the open air, or in such a vacuum as can be obtained by ordinary apparatus, has a life of only a few minutes. The two parties to this interference have discovered methods of using this paper so as to make use of its desirable qualities and lengthen its life to such an extent as to make a practical operative incandescent electric lamp, instead of obtaining mere momentary flashes of light as were given in their first experiments. For those reasons we do not regard the use of paper carbon abstractly as within the issue which must be construed to be paper carbon embodied in an operative combination. Though the methods employed for producing this effect are dissimilar in some respects yet the paper carbon is the basis of the system, and the party who first invented 3296 some manner of practically applying the paper carbon so as to adapt it to use is entitled to an award upon the issue involved herein.

Sawyer and Man made experiments in March, 1878, in which paper carbons were used and, perceiving the difficulties, numerous methods of obviating them were resorted to. During that spring the resistance of the paper carbon was made more uniform by treating it with powdered plumbago and with a hydrocarbon vapor or liquid, and oxygen was excluded from the chamber containing the incandescent conductor, either by creating a partial vacuum therein, or by filling the chamber with a gas (preferably nitrogen).

It is shown that this treatment resulted in a successful lamp, if not that spring, yet certainly in the autumn of the same year.

It is urged by the opposing party that Sawyer and Man no longer employed a paper carbon, but that it was so modified by the treatment as to become a different composition, and so be removed from this controversy. To this it may be replied that the paper carbon still exhibited its desirable qualities, while its defects were modified to such an extent as to render it a success in electric lighting. The principle was the same, though the improvements, from a failure, brought success. A product may receive additions which remove certain of its defects, and yet retain the valuable properties and capacities of the original, and then, because it is an improvement, it is none the less within the scope of the basic product. (See Goodyear Dental Vulcanite Company *vs.* Evans, 3 Fisher, page 390.) If Sawyer and Man first discovered a manner of practically applying a paper carbon as an incandescent conductor, they would seem to be entitled to prevail in this proceeding. It must be held that they reduced the invention to practice as early as the autumn of 1878.

3297 The testimony in behalf of Edison shows that carbon from paper was made by him in 1876, but it was for other purposes than electric lighting. He, however, seems to have been then aware of its quality of high resistance for small surfaces.

Experiments were made by Edison and his assistants relating to incandescent electric lamps in the autumns of 1877 and 1878, and amongst the almost innumerable materials tested, it appears that carbonized paper was included. It was the uniform opinion of Edison, and the other witnesses testifying in relation to these experiments with carbonized-paper conductors that they were unsuccessful, and these opinions were expressed in no ambiguous language. The result was that paper carbons were abandoned, and attention directed to platinum and other metals for incandescent conductors. In the autumn of 1879, while experimenting in this line with platinum, a more perfect vacuum was obtained by means of a new appliance for that purpose, and it then occurred to Edison that as the paper carbon had been formerly destroyed by reason of the amount of oxygen with which it came in contact, it could, with the improved vacuum, be made to operate successfully.

This idea being followed up, it resulted in a successful reduction to practice during the same autumn. The autumn of 1879 is the earliest date of invention which can be accorded Edison, and, as this is a year later than that heretofore given his opponent, judgment of priority of invention must be rendered in favor of Sawyer and Man.

In Re Interference SAWYER AND MAN
v.
EDISON.

"Paper carbons for incandescent electric lamps."

Messrs. Sawyer and Man, care Amos Broadnax, their attorney:

Please take notice that on the 20th day of March, 1882, at 11 o'clock a. m., I shall move before the proper tribunal in the United States Patent Office, for the setting aside of the decision of the examiner of interferences heretofore made in this case, and for other relief, as fully set forth in the motion and accompanying affidavits and papers, copies of which are hereunto appended.

Z. F. WILBER,
Of Counsel for T. A. Edison and the Edison Electric Light Co.

Received above notice and copies this the 15th day of March, 1882.

AMOS BROADNAX,
Attorney for Sawyer and Man.

3301 In the United States Patent Office.

In Re Interference SAWYER AND MAN
vs.
EDISON.

"Paper carbon for incandescent electric lamps."

Hon. Commissioner of Patents:

The accompanying motion in this case, made in the name of Thomas A. Edison, as a party of record thereto, is made by and with the consent and knowledge of and in behalf of the Edison Electric Light Company as sole assignee of the invention and application involved in this interference. And it is made in his name for the reason that in the record, as made up in the Patent Office, his name has been used, and not that of the company assignee.

Given under the seal of said company, this 14th day of March, 1882.

S. B. EATON,
Vice-president Edison Electric Light Co.

Attest: C. GODDARD, *Secretary.*

3302 In the United States Patent Office.

In Re Interference SAWYER AND MAN
vs.
EDISON.

"Paper carbons for incandescent electric lamps."

Hon. Commissioner of Patents.

SIR: And now comes Thomas A. Edison, one of the parties to the above-entitled interferences, by his counsel, and moves that the decision of the examiner of interferences in this case, rendered January 20, 1882, be set aside, that the case be reopened, and that he, Edison, be allowed to take, and to introduce into the case certain new testimony.

This new testimony is as follows: Three letters of William E. Sawyer, one of the parties hereto, to the New York Herald, and published in such paper, on the dates December 24, 1879; January 5, 1880, and January 6, 1880, copies of which are attached hereto, and marked "Exhibit A," "Exhibit B," and "Exhibit C," respectively, and such testimony as may be necessary to show the office conclusively that said Sawyer wrote and caused to be pulished said letters, and to show just what said Sawyer refers to and means in said letters.

A certain book entitled "Electric Lighting by Incandescence and its Application to Interior Illumination," "by William Edward Sawyer," published by D. Van Nostrand, in New York city, in the year 1881, and such testimony as may be necessary to show that said Sawyer wrote and caused to be published said book.

3303 An affidavit made by said William E. Sawyer upon the 21st day of December, 1881, before Walter L. Clarkson, a notary public, in and for the county of New York, State of New York, and such testimony as may be necessary to corroborate the statements of said Sawyer therein as to this controversy. Affidavits are attached hereunto, showing that due and reasonable care and diligence were used in searching for and procuring the testimony in behalf of Edison in this case; that it is newly discovered testimony, the existence thereof having been unknown to any one interested in this case in Edison's behalf prior to decision thereon; that the motion has been made without unreasonable delay, and in the interests of justice.

The testimony is relevant and material in that it will establish three facts, either one of which is fatal to the claims of Sawyer and Man in this controversy, as follows:

1st. That Sawyer and Man were not, and are not joint inventors in the eyes of the law.

2d. That whatever either or both did jointly or severally, in respect of the invention in controversy, prior to the filing of their application, amounted only to unsuccessful and abandoned experiments.

3d. That Sawyer himself, in an enduring and solemn manner, has given Edison credit for the invention of the matter here in issue, taking credit to himself, or to himself and Man only for carbon manufactured from hydrocarbon liquids, and for live "willow-twig carbon."

Wherefore, an order of your honor, for the things moved for is prayed.

Z. F. WILBER,
Of Counsel for Thomas A. Edison.

3304 STATE OF NEW YORK,
County of New York, } *ss:*

Z. F. Wilber, being duly sworn, deposes and says that he has been and is of the attorneys of record in the matter of the application for a patent of Thomas A. Edison, now pending in the United States Patent Office for a carbon for incandescent electric lamps made of paper, and in the interference thereon with an application filed by Sawyer and Man, and likewise pending in the United States Patent Office.

That prior to the taking of testimony therein, he made diligent inquiry and search for all testimony and evidence which might seem relevant to the case and have bearing upon any phase thereof to that end, going over a large mass of records and memoranda and a large number of scrap books containing clippings from the current periodical literature of the day, and communicated the results of such enquiry and search to Col. Geo. W. Dyer, who had charge of the taking of the testimony in behalf of Edison.

That in such search and enquiry he came across only the newspaper extracts already introduced in evidence, nor did Mr. Edison or any one connected with the case, or any one of whom affiant made enquiry, seem to know of the letters, whose introduction into the case is in part the object of this proceeding.

The first knowledge or intimation of the existence of said letters, or either of them, was obtained by affiant from a gentleman, who remembered to have read them at the time, but who had no connection whatever or knowledge of these proceedings, and was absent from the country during the time in which the interference was being carried on, and who, as he informed affiant, obtained the first knowledge that there had been such an interference from learning of the decision thereon. Upon receiving this intimation, affiant again instituted enquiries amongst all the persons connected with Mr. Edison, and was unable to find any person who had
3305 known of the publication of said letters or either of them.

Mr. Edison was personally questioned again and requested to recall, if possible, any knowledge that he had at any time possessed of said letters, or either of them, but was unable to remember them. From thorough enquiries affiant is entirely convinced, and therefore affirms, that the existence of said letters was not known to any person having any connection whatever with said interference proceedings, or from whom he could have obtained that knowledge by any enquiry which he could have made prior to the decision in this case.

Affiant also made and caused to be made, search through the scraps and other books and records of Mr. Edison, and found that copies of such letters were not in the possession of Mr. Edison, or of the Edison Electric Light Co., or of any one connected with him or it.

The letters were published in a daily paper, and it could not have been expected that any of the parties in interest would have known of all that might have been published relative to possible contests. In order to obtain definate knowledge of these letters affiant was compelled to make search through the files of the New York Herald, and having found them, to make manuscript copies for use, having been unable, even by the offer of a large price therefor, to buy or procure printed copies.

Due diligence was used in searching for and gathering up testimony in the case. Knowledge of the testimony in Mr. Sawyer's letters to the New York Herald and in his book was nor had until after decision in the case, and it was of a kind that might easily elude diligent search.

The affidavit of William E. Sawyer reached the Edison Electric Light Company early in this year, but after the case had been closed and the hearing thereon had. Testimony of the facts therein set forth was not, and could not have been in possession of Mr. Edison or the Edison Electric Light Co.

3306 The affidavit itself was the first intimation of the matters it recites, and affiant believes from enquiries made by him that of a certainty the matters therein set forth can be fully substantiated.

Affiant has prepared the motion to which this is appended with all reasonable haste, there having been no greater delay than that occasioned by necessary and proper investigation of the matters set out and consultation with counsel. And the motion is made honestly and in good faith and solely in the interest of justice.

Z. F. WILBER.

Sworn to and subscribed before me, this 14th day of March, 1882.

WILLIAM H. ALDEN, Jr.,
Notary Public, N. Y. Co. (75).

3307 City of Washington,
District of Columbia, } *ss:*

George W. Dyer, being duly sworn, deposes and says, that as one of the counsel of Thomas A. Edison and the Edison Electric Light Co., he had charge of the taking of testimony in behalf of Edison in the interference case "Sawyer and Man *vs.* Edison," on paper carbons for incandescent electric lamps; that in the taking of such testimony and in the preparation therefor diligence was used in searching for and making enquiry for any testimony, verbal, printed or record, which would be relevant to the case.

That in this he was assisted by Mr. Wilber; that he had frequent interviews in relation thereto with Mr. Edison, Mr. Wilber and others, and that in no way whatever was any knowledge of the letters of Mr. Sawyer, in the New York Herald, copies of which are attached to this motion, one of such letters dated January 5, 1880, being a copy of the same letter in the Sun previously put in evidence, or any knowledge of any utterances of Mr. Sawyer in his published book, communicated to him. That he has had no knowledge of any such matters until it was communicated to him within a few days, and this notwithstanding every effort to obtain knowledge of and a purpose to put into the case, all testimony bearing upon any phase thereof. That in his search for testimony he personally examined the scrap books of Mr. Edison, and had assistants of Mr. Edison make search among them and among other files for letters of Mr. William E. Sawyer, and such search by himself and by others failed to elicit the letters, copies of which are attached to the deposition of Z. F. Wilber, now shown to me.

GEO. W. DYER.

Subscribed to and sworn to before me, this 13th day of March, 1882.

[SEAL.] G. E. HARRIS, *J. P.*

3308 EXHIBIT A.

(From the Herald of December 24, 1879.)

Sawyer on Edison and the Herald.

To the editor of the Herald:

Your interesting editorial of to-day advises me not to try conclusions with the Wizard of Menlo Park. I am quite anxious to try them, and am not remarkably easy to alarm, and shall not at present accept you advice, however well intentioned. The Herald is at perfect liberty to advocate Mr. Edison's claims, and I am at perfect liberty to advocate my own.

If you care to settle the question of priority of invention upon the horseshoe lamp as between Mr Edison and myself, you may inspect one of those lamps which broke down at No. 94 Walker street about a year ago, and after many experiments was so far condemned that Mr. Man and I concluded we would not waste enough money on it to pay for a patent. The lamp is at present just exactly as it was removed from the bracket, hermetically sealed in a glass globe, filled with nitrogen gas, and in just exactly the same condition it was in a year ago.

To avoid any question, I placed said abandoned institution in the hands of Messrs. Arnoux & Hochhausen, No. 2 Howard street, yesterday (Monday) morning at 9 o'clock. So far as I am concerned, the Wizard is welcome to patent it. I fail to see what difference it can make to the Herald whether Mr. Edison or somebody else invents the successful electric lamp. Mr. Edison, over a year ago, began this controversy by an attack upon me. He has received one in return, and evidently does not like it. I expect he will have something to say himself in return for that, and I am prepared to meet him half way on any point whatever that he may bring up.

There is no occasion for personalities on the part of the 3309 Herald that I can understand, or for threats. Next week I shall show my system of electric household illumination in this city in practical operation, and if I do not prove it superior to anything else I am much mistaked; and if I do show to those interested that it is superior, all the personalities in the Herald, or by Mr. Edison will not prevent capital putting it where it will do the most good.

W. E. SAWYER.

3310 EXHIBIT B.

(From the Herald of January 5, 1880.)

No. 78 WALKER STREET, NEW YORK, *January* 4, 1880.

To the editor of the Herald:

Notwithstanding the assertion that one of Mr. Edison's electric lamps has been running for 240 hours, I still assert, and am prepared to back up my assertion, that Mr. Edison cannot run one of his lamps up to the light of a single gas jet (to be more definite, let us call it 12 candle power), for more than three hours. To be still more definite, I offer to Mr. Edison, at No. 226 W. 54th street, in this city, an opportunity to prove what he says.

From the private residence in that street wires are run a circuit of a thousand feet. Mr. Edison shall have every facility, he shall use my wires; he shall have my dynamo machine or other generator of electricity he may prefer, and all I ask is that the power of his light shall be measured by a photometer; that once in place it shall not be interfered with; and that a committee of gentlemen, preferably nominated by the editors of the New York press, shall be present to certify to the facts of the test.

Furthermore, I will place one of my lamps side by side with Mr. Edison's; it shall run at a power of 25 candles; it shall outlast the entire forty lamps at Menlo Park, run at the power of 25 candles; my lamp to stand as it is put up, and Mr. Edison to put up a further lamp as fast as the preceding lamp shall have burned out. I am anxious for this test, and if Mr. Edison has really run one of his horseshoe lamps 240 hours he will not refuse to accept my offer, for he will be treated with the utmost courtesy, and shall have everything his own way. I adhere in every particular to my original challenge to Mr. Edison.

Respectfully, W. E. SAWYER.

3311 EXHIBIT C.

(From the Herald of January 6, 1880.)

Mr. Sawyer's Exhibitorium.

To the editor of the Herald:

Your remarks this morning were both interesting and to the point. A great newspaper as the Herald undoubtedly is, should be impartial. I don't know much about the newspaper business, but I know that much. In all the time I have been working at this problem of electric lighting, I have been working simply and solely with a view to a genuine scientific success. I have made no money out of it. Instead of selling out I have increased my original interest by $19,000; have bought my own stock from those to whom I made a gift of it, at 50 per cent. of its par value. I think I know enough about this business not to make a very great mistake, and am not risking my reputation by any wild challenges.

The Herald is in error in implying that this is my residence, and that in consequence, this is a kind of a family matter. I hunted New York over to find some one who would permit me to use his house for a public exhibition. As may be imagined, it was not an easy thing to do. Allow me to correct. My residence is No. 261 W. 42nd street; my office is No. 78 Walker street, my shop is No. 141 Elm street, the exhibitorium is No. 226 W. 54th street.

W. E. SAWYER.

STATE OF NEW YORK, } ss:
County of New York, }

3312 Thomas Johnston, being duly sworn, deposes and says that the foregoing copies of three letters purporting to have been signed by W. E. Sawyer, and copied from the New York Herald, a daily newspaper published in the city of New York, are exact copies of such letters as there published, and that the copies were made by him from the files of the said newspaper, in the library-room of said newspaper, and from papers dated as set forth at the head of each of the three letters.

THOMAS JOHNSTON.

Affidavits of Sawyer, Street, *et al.*, May 11, 1886. T. G., Ex'r.

CONSOLIDATED ELECTRIC LIGHT CO.
vs.
EDISON ELECTRIC LIGHT CO. *et al.*
} H, 3553.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE.

To all persons to whom these presents shall come, Greeting:

This is to certify that the annexed is a true copy from the files of this office of the affidavits of W. E. Sawyer, Robert Street, *et al.*, filed April 3, 1882, in the matter of the interference Sawyer and Man *vs.* Edison.

In testimony whereof, I, E. M. Marble, Commissioner of Patents, have caused the seal of the Patent Office to be affixed this [L. S.] 5th day of April, in the year of our Lord one thousand eight hundred and eighty-two, and of the Independence of the United States the one hundred and sixth.

E. M. MARBLE,
Commissioner.

STATE OF NEW YORK,
City and County of New York. }

William E. Sawyer, residing at Hotel Brighton, corner of 42d St., and Broadway, in the city of New York, being duly 3317 sworn, deposes and says that on or about November 5th, 1881, while doing business at 111 Liberty St. in said city, deponent's partner, Rob't Street, residing at 130 Eldridge St. in said city, came to deponent and said that he had an important matter to communicate, to wit, that one S. Bergmann, a friend of his, doing business for T. A. Edison, in Wooster St., in said city, had offered him, Street, the sum of one thousand dollars for the purpose of inducing deponent to throw over the side of Sawyer and Man, and Thos. A. Edison for what is known as the carbon filament electric incandescent lamp; that deponent was busy and said no more about the matter than to remark it was very singular the Edison people were getting so hard pushed as to have to resort to bribery to secure their patents.

And deponent further states that on or about November 7th, 1881, said Street came to deponent and handed him twenty gold coins of the denomination of five dollars each, saying, "That shows the Edison crowd means business; Bergmann says you will get the rest as soon as you testify for them." Deponent said he did not want the money but its payment might some day be of use and he would receive it, and deponent gave two of the coins to said Street, and the remainder he gave away to various persons, immediately thereafter.

William E. Sawyer, residing at the Hotel Brighton, corner of 42d street and Broadway, in the city of New York, being duly sworn, deposes and says: That on or about March 7, 1882, while deponent was about leaving the Hotel St. Stephens, 11th street, in the city of New York, where deponent then resided, to go down town to work, a waiter handed deponent the card of Z. F. Wilber, whom deponent knows as one of the patent counsel of Thomas A. Edison, saying that said Wilber desired to see deponent; deponent said he had no time, but would meet said Wilber at the door; deponent then rode down the elevator and passed out to his coupé; there he met said Wilber, who held a roll of papers and said he was very anxious to have a talk with deponent; deponent replied that he could not stop, but that said Wilber might jump into the coupé if he was going down town, and we could talk there, which said Wilber did.

And further deponent states, that the said Wilber rode down to deponent's office, at No. 103 Fulton street, and entered the same, all the time urging upon deponent the importance of helping the Edison Company to reopen the interference suit between W. E. Sawyer and Albon Man on the one side and Thomas A. Edison on the other, and offering deponent the sum of two thousand five hundred dollars if deponent would reply as an unwilling witness to certain questions which the Edison side would ask, and which, properly answered, would result in giving the patent to Edison; that deponent declined to converse upon the subject, or to answer any questions unless the same were put in writing; and while said Wilber was in deponent's office deponent obtained from said Wilber, a promise to submit the same in writing by four o'clock the 3320 same afternoon, and the said Wilber then retired and went directly to the Edison headquarters, at No. 65 5th avenue, in the city of New York.

Norvin Green, being duly sworn, says:

1. I am the president of the Edison Electric Light Company, and have been so since its organization.

2. I give a general attention to its affairs, but without entering into the management of details. The entire management of the company's affairs, in all their details, are entrusted to Sherburne B. Eaton, vice-president, and all facts concerning the company are necessarialy known to him.

3. I have read the affidavits of William E. Sawyer and Robert Street, dated the 10th of March, 1882, and of the said Street and E. S. Whitmore, and the said Sawyer, dated the 11th of March, 1882.

4. So far as I am able to learn, the Edison Electric Light Company has never authorized any person to offer a pecuniary or other inducement to Mr. Sawyer, directly or indirectly, as consideration for his giving testimony. No such matter has been broached or spoken of to me, and upon my best information and belief, I declare that all statements or suggestions to the contrary are untrue.

NORVIN GREEN.

Sworn and subscribed before me, this 20th day of April, 1882.

CHARLES ROTH (28),
Notary Public, N. Y. Co.

(Endorsed: U. S. Patent Office, May 8th, 1882; affidavit of Norvin Green.)

3324 City of New York,
County of New York, } *ss:*

Sherburne B. Eaton, being duly sworn, says:

1. I am the vice-president and executive officer of the Edison Electric Light Company, and have been such since the company first began active business in New York about January, 1881, and since that date I have given my entire time to its business, being the only one of its officers, except the secretary, who has done so, and I am cognizant of all its affairs of whatsoever nature. During the time above named, I have not been away from the office of the company for a single day, but have been on duty every day at the office of the company in general charge of its executive matters. On the contrary, from this company having ever attempted or proposed to obtain evidence from William E. Sawyer, or any other persons, by offering pecuniary or other inducements for the same, they have had repeated propositions made to them, on behalf of said Sawyer, for the sale of affidavits, to be sworn to by him, and have unconditionally and unequivocally refused the same.

2. For many years I have been in the habit of keeping a daily diary in which is entered the important events of that day which are not likely to be recorded elsewhere; that is to say, in the usual office correspondence or otherwise, where they would be likely to be preserved and easily found. By this diary I see that on the 9th day of January, 1882, a Mr. Sawyer, who announced himself as father of Prof. William E. Sawyer, and as residing at the Brandreth house, called upon me at 11 o'clock in the forenoon, and spent three-quarters of an hour with me. My entry says: "He wishes to invalidate his son's patents taken out in the name of Sawyer and Man. He says he desires no compensation, nor does his son, but he thinks the attorney's fees for drawing the papers would be about $2,500. He said nothing whatever about having the
3325 attorney divide that money with him. His plan is as fol-
lows: He says the 'law is that where a patent is taken out on application made by two persons as co-inventors, if there is, in point of fact, but one such inventor, such fact invalidates the patent, and Prof. Sawyer and William Sawyer both propose to furnish affidavits saying that Mr. Man was not a co-inventor. Mr. Sawyer says that Mr. Man will not dare to deny this, and that even if he should, he would have no corroborative testimony, Mr. William Sawyer himself, he having been a mechanic, being the only third person, who was present at the experiments.'"

3. By the diary of January 12, I also see that Mr. Sawyer called again, and to see if we had reached any decision about his offer of the preceding Tuesday above referred to, to give us the points to invalidate the Sawyer-Man patents.

4. Again, I find by the diary for January 26, 1882, that I was called upon by some person claiming to represent Mr. Sawyer. The entry in my diary of this date is as follows: "Prof. Sawyer and the paper carbon. At four o'clock this afternoon a man called on me, and stated that he came from Prof. Sawyer, and said he had

an affidavit which Sawyer was willing to make. He read it to me. He said Sawyer wished no compensation for making the affidavit, but would take one thousand dollars for six months on his, Sawyer's note. The affidavit stated Sawyer's testimony was full of errors. That in February, 1879, Sawyer and Man both abandoned the carbon paper as impossible practically. That they did not touch paper carbon then until January, 1880, when Edison's article was printed, that then, in January, 1880, Man and Chever came to Sawyer and told him they could make from 150 to $200,000 by filing a claim against Edison. That they afterwards, through their counsel, coached Sawyer on what to swear to. That he told them he would not swear to most of what they wanted him to swear
3326 to, as it was absolutely false, and that thereupon it was
agreed that Man himself should swear to the doubtful and untrue things. That it was on such false evidence the case was won before the Patent Office, and that Sawyer wishes now, as justice to Edison, to tell his story, and to ask the Patent Office to reverse its decision. I told the party our company would have nothing to do in the matter," etc., etc.

5. I find also that on February 6th the same person called again, and the diary entry relating to that interview is as follows: "Sawyer's affidavit. Sawyer's agent called on Saturday and told me that Bergmann had told him that our company would like the affidavit to use or not, as we might think best, but that we would not pay for it. Sawyer's representative then asked me to buy a note as an outside transaction, and not have it considered as payment on account of the affidavit. I told him that was simply whipping the devil round the stump. I told him we could do nothing whatever which would be in point of fact the payment of money to Sawyer for an affidavit. To-day Bergmann sends me a letter written to him by Robert Street, Sawyer's partner. Money is what they want. I repeated to Bergmann in reply, the conclusion already reached by Edison, Lowrey, myself and others, namely, that we could not afford to pay Mr. Sawyer any money for his affidavit." Regarding the extracts from my diary which are made in this affidavit, the entries of which they are extracts, were made on the days when the events recorded on those specific days, took place, that is to say, upon the days they purport to have been made upon, and in each and every case they represent accurately and truthfully the event, conversations and other matters which they purport to represent, and are full, correct and true accounts of just what occurred.

6. About this time, that is to say, about February 6th, I learned for the first time that the New York Herald of December 24,
3327 1879, contained a letter purporting to have been written
by W. E. Sawyer, the contents of which I was advised by the counsel of the company, would materially aid Mr. Edison upon the question of abandonment by Sawyer and Man of their experiments upon paper carbon, and I resolved to have a motion made to open the case to put in that testimony, and with this view I conferred with Major Wilber, Mr. Lowery, and Mr. Edison, and finally

instructed Major Wilber to visit the Herald office to procure a copy of the letter and proof of its authenticity if possible. In a few days Major Wilber reported to me that he was unable to procure a copy of the paper, but had made a manuscript copy, and was unable to obtain an affidavit from any one connected with the Herald, which would prove that Sawyer was the author of the letter. I mentioned this to Mr. Lowrey one day, on or about March 6th, 1882, when he was present in my office, and we sent for Major Wilber, whose office is in the same building, and after some conference I instructed Major Wilber to call upon Sawyer himself, and to ask him to give us an affidavit admitting that he was the writer of that letter. Major Wilber expressed strong aversion to visiting Sawyer for any purpose, particularly as he said that Sawyer was a man who would wilfully misrepresent anything said to him, if it was for his interest, and as it was well understood between us that his affidavits upon other subjects had been offered for sale to the company, Major Wilber gave it as another reason for objecting to the visit that Sawyer would speak to him about them, and no one could know what he would say by way of misrepresentation of the interview. I replied to Major Wilber that he must not permit himself to discuss any other subject with Mr. Sawyer, and to stick closely to the business in hand, and with that understanding and instruction Major Wilber left my office saying that he would prepare an affidavit in advance for Sawyer, expressing what he understood to be the truth, and confine himself strictly to obtaining Mr. Sawyer's
3328 assent to that statement. He returned to my office
the following day saying that he had seen Sawyer, and that Sawyer, although he had admitted writing the letter, refused to make an affidavit to that effect, unless he was paid for it. Major Wilber handed to me at the same time, in accordance with the usual custom of our office, a written report of what he had done, which report is endorsed upon the back of the affidavit prepared by him. That report has remained in my possession to this time, and is attached hereto with the office-file envelope in which it was contained. I have stated the whole of the instructions and authority given to Major Wilber. He was certainly not authorized to do anything with Mr. Sawyer, except to request in the ordinary way that he should make affidavit of the truth of a fact which we believe there can be no dispute about, but which it was difficult for us to make technical proof of.

7. Mr. Bergmann has no connection with this company, and has never been authorized or requested in any way to intervene, or act for it in this, or any other business. Whatever he may have said or done with Mr. Sawyer, if anything, has been entirely without our knowledge, authority, or consent.

8. In addition to what appears stated in my diary in respect to communications sent to me purporting to be on behalf of Mr. Sawyer, I find also on file the following letter, dated New York, January 17, 1882.

"DEAR SIR: I wish you would decide immediately on my proposition or convey to Mr. Thatcher some idea of when I may look for a dicision.

Respectfully, W. E. SAWYER."

3329 The original is hereto attached. I know no other proposition to which that could relate than the proposition made to me by Mr. Sawyer, Sr., on the 9th of January. Nor do I know any Mr. Thatcher who is referred to, but I presume he was the messenger, and that he is the Mr. Thatcher who has made an affidavit in this case. I told the messenger who brought this letter that I could not give Mr. Sawyer encouragement that we should buy such affidavits.

9. I have read all the affidavits of Street, Sawyer, Thatcher and Whitmore, filed in opposition to our motion to open the interference between Edison and Sawyer-Man, and any and all statements there made to the effect that this company or any of its officers, or any person acting as its authorized agent, or any person whatever representing the company with any authority from it, has at any time bought or agreed to pay William E. Sawyer any money, or to give him any compensation of any kind whatsover for making an affidavit, or giving any testimony, or doing anything whatever in connection with patents or any other business, is utterly and entirely false to the best of my knowledge, information and belief, and neither in the case of William E. Sawyer nor in any other case whatsoever has this company ever purchased or sought to purchase any testimony of any nature or description whatsoever.

10. All transactions on behalf of this company, involving any payment of money, must eventually come before the board of directors and pass through the treasurer's account. The treasurer is Egiston P. Fabbri, Esq., banker and member of the house of Drexel, Morgan & Co., and the directors are—

Norvin Green,
James H. Banker,
Grosvenor P. Lewery,
Robert L. Cutting, Jr.,
Sherburne B. Eaton,

Henry Villard,
J. F. De Navarro,
Nathan G. Miller,
Thomas A. Edison,
Egisto P. Fabbri.

3330 The secretary of the company is Calvin Goddard, Esq., and he with myself have our only office in the office of the company, and are the only ones of the officers who devote our time to its affairs and all and every part of its business whatsoever is done by us or one of us; neither the president or treasurer take any part therein, except in an advisory way, and neither of them kept an office in the office of the company.

SHERBURNE B. EATON.

Sworn to and subscribed before me this 21st day of April, 1882.

WM. H. MEADOWCROFT,
[L. S.] *Notary Public, New York County.*

Letter from Major Wilber to S. B. Eaton, V. P., giving details of interview with William E. Sawyer, on March 7, 1882. Also form of affidavit.

Filed in safe, March 10, '82.
Opened April 13, 1882.
The Edison Electric Light Company, 65 Fifth Ave., New York.

STATE OF NEW YORK, }
County of New York, } *ss:*

William E. Sawyer, being duly sworn, deposes and says, that he is the William E. Sawyer who is joined with Albon Man in an interference now pending in the United States Patent Office, titled "Sawyer and Man *versus* Edison."

3331 Further that he wrote and caused to be published certain letters in the New York Herald, a newspaper published in the city of New York, at dates as follows: December 24th, 1879, January 5th, 1881, and January 6th, 1881. (Copies of which are hereto appended.)

Further that he is the author of a work entitled "Electric Lighting by Incandescence, and its Application to Interior Illumination," published by D. Van Nostrand, in the city of New York, in the year 1881.

The first exhibit referred to in the affidavit of Sherburne B. Eaton.

Sworn to and subscribed before me, this — day of ——, 1882.

WM. H. MEADOWCROFT,
Notary Public, New York County.

(Endorsement: March 7, 1888. I, this morning, rode with Wm. E. Sawyer from his hotel (St. Stephen) to his office. I asked him to make oath to enclosed affidavit. He admitted to me that it stated only the truth, but declined to give the affidavit unless he was paid money for the same, saying it would cost "you" (meaning the Edison Elec. Light Co.) several hundred dollars to prove the facts, and "I (meaning himself) don't propose to prove them unless you pay me." Z. F. Wilber.)

3332 W. E. Sawyer. Rob't Street.

Sawyer & Street, electrical engineers, 111 Liberty street.

NEW YORK, *January* 17, 1882.

DEAR SIR: I wish you would decide immediately upon my proposition or convey to Mr. Thatcher some idea of when I may look for a decision.

Respectfully, W. E. SAWYER.

The second exhibit referred to in the foregoing affidavit of Sherburne B. Eaton.

WM. H. MEADOWCROFT,
Notary Public, New York Co.

(Endorsement: 2; affidavit of S. B. Eaton; U. S. Patent Office, May 8, 1882.)

STATE OF NEW YORK, }
City and County of New York, } *ss:*

Grosvenor P. Lowrey, being duly sworn, says:

1. I reside in the city of New York, am a lawyer by profession—a member of the firm of Porter, Lowery, Soren & Stone, at No. 3 Broad street, in the city of New York, and a director of the Edison Electric Light Company, and a member of the executive and finance committee which, under the by-laws, exercises virtually all the powers of the board of directors.

3333 2. I have given much attention to the affairs of the company since its organization in 1878, and it is my practice to attend a part of each day at its office for the purpose of consulting with Major Eaton, who is principal managing officer, upon any and all questions of business which may arise.

3. I have read the affidavits of William E. Sawyer and Robert Street, purporting to be sworn to and subscribed before Samuel Goodwin, notary public, on the 10th day of March, 1882, and also the affidavits of Robert Street, E. S. Whitmore, William E. Sawyer and Galen C. Thatcher, purporting to be sworn before the same notary on the 11th day of March, and I believe I am fully acquainted with all the principal facts and circumstances to which these affidavits purport to relate. So far as they charge the Edison Electric Light Company with having authorized or entertained any proposition or idea of obtaining the evidence of Sawyer or any other person through Street or any other person upon a pecuniary or other consideration in the manner charged, or in any other surreptitious or improper manner, they are false.

4. Some time in January, 1882, Major Eaton, vice-president of the Edison Electric Light Company, informed me that he had been visited by persons professing to represent Sawyer, who read or showed to him a paper drawn in the form of an affidavit to be signed by Sawyer, and which Sawyer was willing to swear to. He informed me that at the same time these persons stated that Mr. Sawyer would desire either to be paid for his affidavit, or to get money in some way as a consideration for making it. I did not read any of these papers, but was told their purport by Major Eaton. On the first occasion when he spoke to me on the subject, he ended his communication of the facts by saying, "Of course, we can do nothing of the sort," to which I responded, "Certainly not," and nothing more was said. On a subsequent occasion, when he told me of another visit, and still again that an attempt had 3334 been made through Mr. Bergmann to get Mr. Edison to consider a similar application, and said, "Even if the facts are as stated, the manner in which they are brought to our attention, and the condition upon which they are offered to us preclude us from using them," to which I assented. At one of these times he informed me that he had received through the mail a paper pur-

porting to be a complete affidavit signed by Sawyer. About this time I was asked by Major Eaton for my judgment upon the propriety of a motion to reopen the interference between Sawyer and Man and Edison upon the paper carbon, in consequence of the discovery of a letter of Sawyer's, published in the New York Herald, and which was thought to be material. I advised him that the letter, if authentic, furnished the very best possible evidence of an abandonment, being a clear admission of that fact by Sawyer, with whom interest, pride and every other motive would concur to make him claim everything possible, and being part of a boasting letter where he might make such claims without responsibility, and would certainly make no disclaimer against his interest and pride unless it were certainly and notoriously true, and that in that view the letter seemed to me to be material evidence equally binding upon the parties opposed to us in the interference, whether one of the applicants had or had not parted with his interest in the invention, and in connection with this advice, I suggested to him that he might, in my opinion, with propriety include the affidavit of Sawyer, which had been sent in by mail, it having been voluntarily given without any condition restraining the free use of it; and I added that if we could, by reopening the case, get an opportunity to examine Sawyer orally, we should, perhaps, be able to ascertain the truth in a manner to which there could be no objection. At this time, or within a few days after, being at the office of Major Eaton, he sent for Major Z. F. Wilber for a consultation in respect to this motion, and I heard all that occurred between them.
3335 Major Wilber reported that he had tried in vain to obtain a copy of the New York Herald containing the letter, but exhibited a manuscript copy made from the Herald files, and he added that it was impossible to get any Herald editor to make a voluntary affidavit, and that it seemed difficult to name the witnesses by whom its authenticity would be proved as required under ordinary circumstances on motions for a new trial. I asked if Sawyer had been applied to for proof of authorship, saying that I could scarcely conceive it possible that he would refuse to give proof of a fact the truth of which must be so well known to his associates. Major Eaton asked Major Wilber if he knew Sawyer, and being answered in the affirmative, requested him to go to Sawyer and see if he would make such an affidavit. Major Wilber expressed strong dislike of having any communication with Sawyer, saying that he was notoriously untruthful, and no one could know how he would misrepresent anything that was said to him. Both Major Eaton and I said there could be but little danger of misrepresentation if Major Wilber would not permit himself to be drawn into a discussion of any other matter than simply the one concerning which he was to make the visit, and with this understanding he left Major Eaton's room taking with him the manuscript copy of the Herald letter. He came into my office at 3 Broad street next day and said it was useless to talk to Sawyer, that he admitted writing the letter, but said "It will cost you $200 or $300 to prove it, and you may just as well pay me that as to pay it to somebody else." Major

Wilber said that finding a voluntary affidavit would not be given, he had left Mr. Sawyer, and there was no further result of the visit. In the conversation between Major Wilber and Sawyer they both referred to the fact as being well known that various applications had been made to the company for the purchase and sale of affidavits by Sawyer, which had been refused, and Wilber declared that he would not speak to Sawyer at all, except that it was
3336 doubtful whether we could make the proof of this letter in any other way.

5. Within a day or two after that Major Eaton announced to me that he had been speaking of this letter in the presence of Mr. Arnoux, of the firm of Arnoux & Hochhausen, when Mr. Arnoux said that he was present when the letter was written. Major Eaton told me that he immediately requested Mr. Arnoux to make an affidavit of this fact which would sufficiently prove the authorship of the letter, and added, "We shall now be able to go on."

6. I know Albon Man who is joint applicant with Mr. Sawyer. He was at my office some two months ago, about the time of the decision in this matter, but whether before or after I cannot remember; but it was certainly before the making of this motion, and before it had been advised by me. I think Mr. C. C. Allen, who is an associate with Mr. Man in the Eastern Electric Light Company, which is, I believe, the owner of all the Sawyer and Man inventions, was also present. In the course of conversation Sawyer came to be spoken of, and his general character being under discussion, I informed Mr. Man that Mr. Sawyer's affidavits had been offered for sale to our company. I did this with perfect freedom, accompanying it with the statement that the offers had been declined. Mr. Man expressed no surprise, but both he and Mr. Allen received the statement naturally as a thing that did not at all surprise them, and I think something was said by them about his having done the same with other people. The remark upon this subject was in a passing way on both sides, and I speak of it only to give evidence to the Commissioner that the Edison Electric Light Company not only was not enlisted in any such business as is suggested by the Sawyer and Street affidavits but that when it happened,
3337 naturally and in a convenient way I gave information to Mr. Man of the fact.

G. P. LOWREY.

P. B. Wilber, being duly sworn, deposes and says:

I am of lawful age, and a citizen of Cincinnati, temporarily resident in New York.

I have read the affidavit of Z. F. Wilber, dated April 19, 1882, and especially that portion describing a visit by him and interview with Wm. E. Sawyer, on the 12th day of April, 1882. I was present at such interview and heard the conversation. The account given of it by Z. F. Wilber, in the affidavit referred to is a full, complete and correct account of the conversation he had with Mr. Sawyer.

P. B. WILBER.

County of New York, }

W. H. Meadowcroft and R. N. Dyer, both residents of the city of New York, being duly sworn, depose and say:

1. That they were both present at an interview between S. Bergmann and Robert Street, upon April 5th, at the office of S. Bergmann & Co., No. 108 Wooster street, New York.

2. That the substance of such interview is faithfully and truthfully set out in a minute thereof attached to the affidavit of Philip H. Klein, Jr., dated April 20, 1882, and there forming part of Exhibit G.

3. That such minute, forming part of Exhibit G, was made immediately after the interview, and upon the date set forth therein; and was read over and was signed by them at that date.

WM. H. MEADOWCROFT.
R. N. DYER.

Sworn to and subscribed before me this 21st day of April, 1882.

WM. H. ALDEN, JR.,
Notary Public, New York Co. (63).

(Endorsed: 5; affidavit of W. H. Meadowcroft; U. S. Patent Office; May 8, 1882.)

3339 STATE OF NEW YORK, } *ss:*
County of New York, }

Charles E. Chinnock, being duly sworn, deposes and says as follows:

1. That he is of lawful age; is electrician of the Metropolitan Telegraph and Telephone Company, of New York city, and resides in Brooklyn, New York.

2. That he knows Siegmund Bergmann, of the firm of S. Bergmann & Co., of 108 Wooster street, New York, and Robert Street, of the late firm of Sawyer & Street, electricians, New York city.

3. That late in February or early in March, at least more than six weeks ago, affiant met Mr. Bergmann accidentally on the street,

whereupon Mr. Bergmann asked him to go into a saloon with him, which he did, that they found in the saloon Mr. Street, with whom Mr. Bergmann had some casual conversation, and then said to Mr. Street: "Street, you've had that money pretty near long enough; ain't it about time you paid me that hundred dollars; I don't want to be running over here after it so often." Street said, "Don't worry about it, I'll repay it as soon as I can make a raise; I'm a little hard up just now." Bergmann then told him if he couldn't pay it all at once, to pay part of it at a time, and Street said he would. The conversation was not in a rough, boisterous tone, but Mr. Bergmann asked for the money in a gentlemanly and moderate
3340 way, but the conversation was sufficiently loud for me to hear it, and the above is the substance of the conversation.

After a few words more we (Mr. Bergmann and I), left the saloon, and further affiant sayeth not.

(Endorsed: 6; affidavit of C. E. Chinnock; U. S. Patent Office; May 8, 1882.)

3341 STATE OF NEW YORK, }
Counoy of New York, } *ss:*

Siegmund Bergmann, being duly sworn, deposes and says:

1. I am a member of the firm of Bergmann & Company of Nos. 108 to 114 Wooster street, in the city of New York, and am a manufacturer of electrical apparatus.

2. I know Robert Street, who has made an affidavit in the matters of interference between Sawyer and Man and Thomas A. Edison, dated the 10th day of March, 1882, and have known him for eight or ten years. We w*a*re formerly shopmates in the employ of Mr. Windram. Mr. Street is now in business as an electrical engineer, and I, being a manufacturer of electrical apparatus, and desirous of securing work and employment from all persons who are in any way interested in the business, and have been in the habit from time to time of seeing Mr. Street and keeping up a friendly acquaintance.

4. On the 7th of November, 1881, Street called at my office, and after a few minutes' conversation asked me to loan him one hundred dollars. I understood at the time that Street was associated with Sawyer, and that they were together electricians of the company, called the Eastern Electrical Manufacturing Company, and partly because of willingness to befriend him, and partly because I through- it impolitic to decline, since he might be in the way of either influencing business to me or of preventing it coming to me, I decided to lend him the money; but said, "You must pay this back promptly," and he promised that he would do so very soon. I then turned to my book-keeper and directed him to draw from my per-

sonal account a check for one hundred dollars. Mr. Street asked me then if I would not get the cash, as he had no means of using
3342 a check. I said, "I am going right down town, and I will go to the bank with you and get the money there." By my direction, therefore, the check was drawn to my order, and the check is attached to the affidavit of Philip H. Klein, Jr., dated April 20, 1882, and is marked "Exhibit A." I directed that there be taken from him at the time a receipt in my general receipt book, which was done, and which receipt is this day detached from the book, and is now attached to the affidavit of Philip H. Klein, Jr., dated April 20, 1882, and marked "Exhibit B." I do not think that up to that time Street had ever said anything to me concerning this interference, or any interference between Sawyer and Edison, although he was in the habit of freely talking about the Sawyer inventions, and claiming that Sawyer had all the valuable patents and inventions on electric lighting, and if this was true, and I had no means of knowing whether it was true or not, I regarded it as a reason why I should keep in friendly relation with Mr. Street, who might be able to get me important employment as a manufacturer. Nothing ever, that I remember, was said at this interview upon any subject except his desire to borrow one hundred dollars. I went with Street to the bank where I drew the money and handed it to him.

4. Afterward, and some time in the month of January, Street brought to me a paper, which I was told was in the handwriting of Mr. Sawyer, and which he said Mr. Sawyer would be willing to swear to. I read the paper over, and we had some conversation concerning the subjects to which it related. I cannot remember now that I had ever heard of that interference proceeding before that time. As I have no connection whatever either with Mr. Edison or the Edison Company except that I manufacture for them upon orders given to me, just the same as I do for any other person. I did not see why this matter should be mentioned to me. I, however, was desirous to serve both Mr. Street and the Edison
3343 Company in any proper way, and without looking into the matter any further, I had a copy made of that paper at the time and enclosed it at once to Mr. Edison. A true copy of the proposed affidavit of Sawyer is annexed to the affidavit of Philip H. Klein, Jr., dated April 20, 1882, and is marked "Exhibit D." I asked Street for permission to take the copy, to which he assented, but when I attempted to copy it in my letter-press book, he objected to having a letter-press copy taken, the reason being as I understood, because the original was in Sawyer's handwriting. I therefore took out the first page which had been put in the copying book and directed my book-keeper to make a manuscript copy, which he did. I received no answer whatever from Mr. Edison, and meeting him a few days after, I asked him if he had anything to say upon the subject, and he replied that he had nothing to do with business of that sort, and that he had sent the paper to Major Eaton.

At this interview, all that I said to Mr. Edison was, "I suppose you have received my letter; what reply shall I make to Mr. Street," and he made the answer above stated. In the meantime I received from Mr. Street a letter under date of February 6th, which I immediately forwarded to Major Eaton. In answer to that I received under the same date, a letter of S. B. Eaton. These two letters are annexed to the affidavit of Philip H. Klein, Jr., dated April 20th, 1882, and marked Exhibits E and F respectively. This is absolutely all which has ever occurred between Street and myself, or between myself and Edison, or any other person relating to the inventions of Sawyer, or Sawyer and Man in interference in this matter, either directly or indirectly, which in any way related to the matter in interference, or to the patents of Sawyer and Man; nor have I ever received any instruction, request or communication whatsoever from Mr. Edison, or any one for him or from the company, or any of its officers relating to this subject, except as above stated.

3344 5. I have read the affidavit of W. E. Sawyer herein, dated March 10th, and that of Robert Street dated the same day. I find in those affidavits that Sawyer swears (1) that Street said that I had offered him one thousand dollars for the purpose of inducing Sawyer to throw over the side of Sawyer and Man in the interference suit then pending for what is known as the "carbon filament electric incandescent lamp;" (2). That subsequently on the 7th of November, Street came to Sawyer and handed him twenty gold coins of five dollars each, saying: "That shows the Edison crowd means business. Bergmann says you will get the rest as soon as you testify for them;" and (3) that Street swears he has read the "foregoing" affidavit, and that the twenty gold coins of five dollars each mentioned therein were paid to him for the purpose specified. I am advised by Grosvenor P. Lowrey, counsellor-at-law, that these affidavits fail to make any allegation against me capable of being traversed; since I cannot say that Street did not make to Sawyer the statements alleged, (although they were entirely false if they were so made); and since Street's affidavit does not identify Sawyer's affidavit under the term "foregoing affidavit," and since he does not say that the gold coins were paid to him for the purpose "specified" in Sawyer's affidavit; and since the allegation that the other statements contained in the foregoing affidavit: (even if the affidavit referred to is the affidavit of Sawyer of that date) amounts to no more than an averment that Sawyer speaks truly when he swears that Street made such statement to him, and is not an averment of the truth of those statements if made. But waiving all criticisms of these affidavits I declare that so for as they either expressly or by implication, charge me with having made any offer of money, or other inducements for the purposes specified in the affidavit of Sawyer, they are absolutely untrue.

6. Since the 7th of November, I have on several occasions asked Street to return me the $100 borrowed; on one occasion in
3345 the saloon where he resides, about the end of February, or
1st of March, in the presence of Charles E. Chinnock, of the
Bell Telephone Co., of New York. I met Street by chance and said

to him, "Street, it is about time that you had paid me back some of that money." He answered that he would as soon as he could raise some money. I said that he need not pay it all at once, but could pay a part at a time. He said that he would do so. This loan is the only pecuniary transaction I have had with Robert Street within the past five years.

When I heard of this matter, by being informed by Major Eaton, of the affidavits of Street and Sawyer, I immediately went to find Street; I succeeded in finding him in the saloon where he resides, and I demanded of him that he should come with me to the office of the Edison Electric Light Co. and correct the false statements made in his affidavit, or to correct the erroneous interpretation which had been put upon those affidavits. He at first denied that he had made any affidavit. He then asked me whether I had seen the original affidavits, and said there must have been some mistake about it, because he was sure that my name was not mentioned in those affidavits. He added that he would like to see the paper from Washington and read it. As he refused to go with me to the Edison Electric Light Company's office, I asked him to come with me to my office, and he did so. I immediately sent to the company's office for the papers and for Major Eaton. Mr. Meadowcroft, who is Major Eaton's clerk, came at once with the papers. Mr. R. W. Dyer came in by chance. In the presence of these gentlemen the affidavits were read over. I turned to Mr. Street and asked him to state the truth and to say that these affidavits were false. He replied that he could not say anything until he saw Mr. Sawyer. I repeatedly urged him to state the truth and to say, as he and I knew the fact to be, that the transaction in respect to the $100.00 was only a loan made to him as a friend, having no reference 3346 whatever to any other matter. He repeated again that he could have nothing to say until he saw Mr. Sawyer. I asked him to state whether I had attempted in any way to bribe him, or to bribe Mr. Sawyer through him, and he replied that he did not think so but that he could not remember just then, but that he must see Mr. Sawyer. He constantly replied to all my questions that he could not remember but that he must see Mr. Sawyer. He also said that if I wanted to see him I ought to see him alone, and not in the presence of two or three witnesses. I then charged him with perjury, and with attempting to prejudice and injure me with one of my principal employers, the Edison Company. After the interview had ended, Mr. Meadowcroft made a short minute of what had occurred, and which was signed by himself, Mr. Dyer and myself, and all that is stated in that minute is strictly true. Said minute is attached to the affidavit of Philip H. Klein, Jr., dated April 20, 1882, and is there marked Exhibit G.

8. On the 12th day of April I received at my office a letter from W. E. Sawyer, the orignal of which is hereto annexed, marked Exhibit A, to which I have not made and do not intend to make, any response.

(Signed) S. BERGMANN.

(Endorsed: 7; U. S. Patent Office, May 8, 1882; affidavit of S. Bergmann.)

State of New York, }
City and County of New York, } *ss:*

Thomas Alva Edison, being duly sworn, says:

1. I have read the affidavits of William E. Sawyer and Robert Street, dated the 10th and 11th of March, 1882, and filed, as I am informed, in opposition to a motion before the Commissioner of Patents for a rehearing of the interference between Sawyer and Man and myself.

2. I have never authorized or requested Mr. Bergmann, Major Wilber or any person whomsoever to take any action whatsoever for me or for the Edison Electric Light Company in respect to evidence to be furnished by William E. Sawyer, and so far as those affidavits by implication or express statement can be construed to charge the contrary they are utterly false.

3. With Mr. Bergmann I have no connection whatever, except that he is a member of a manufacturing firm from whom the
3348 Edison Electric Light Company, in which I am a stockholder, purchases a certain class of manufactured articles, and I have never even spoken to Mr. Bergmann in respect to any matter in controversy between me and Sawyer or Sawyer and Man, except that about three months ago he came to me and said that Sawyer was coming around to get him to lay a proposition before me that he (Sawyer) would confess or make known the truth concerning some of the matters involved in this interference. I stopped Mr. Bergmann in his explanation, and after telling him that I would have nothing whatever to do with Mr. Sawyer, I advised him (Bergmann) also to have nothing to do with him, and never to talk with him upon any subject, except in the presence of a witness. In giving this advice to Bergmann, which is all that I have ever said to him, I was advising him according to my own practice, for in the last two years I have received a great many letters from Sawyer asking for interviews, to which letters I have never even returned an answer. The last of these letters was received a few days ago and is hereto annexed.

4. Just about the time, or perhaps a day or two before Bergmann had this conversation with me, he sent me what purported to be a form of affidavit prepared to be signed and sworn to by Sawyer. I sent this paper directly to Major Eaton, he being the executive and managing officer of the Edison Electric Light Company (which is the owner of my invention in interference), and the proper person to represent that company in all legal business, and I communicated to him the next time I saw him my strong objections to having the company entertain any proposition or enter into any communication with Sawyer, and I have no further knowledge of any of the matters which are, or seem to be, covered by the affidavits of said Street and Sawyer.

3349 5. I have made inquiries as to the action of Messrs. Wilber and Bergmann, and am entirely convinced that the affidavits are untrue in all material points relating to them. Neither the company nor myself can prevent such propositions being made to us, but we can refuse to entertain them, and this I have done, and am informed and believe the company has also done so in the most unequivocal manner.

T. A. EDISON.

Sworn and subscribed before me, this 21st day of April, 1882.

WILLIAM H. MEADOWCROFT,
[L. S.] *Notary Public, N. Y. Co.*

Received April 14, 1882.
Answered not 188

W. E. Sawyer, electrical engineer, electric railways and lighting,
No. 61 Broadway.

NEW YORK, *April* 11, 1882.

DEAR SIR: I would like to see you very particularly on important business.

Truly yours, W. E. SAWYER.

When will it, and where will it, and under what circumstances will it, if at all, be convenient for you to see me?

Exhibit referred to in the foregoing affidavit of Thomas A. Edison.

WM. H. MEADOWCROFT,
Notary Public, N. Y. Co.

From W. E. Sawyer, N. Y.

(Endorsement: Affidavit of Thos. A. Edison, U. S. Patent Office, May 8, 1882.)

3350 STATE OF NEW YORK,
City and County of New York, } *ss:*

Egisto P. Fabrri, being duly sworn says:

1. I am a member of the firm of Drexel, Morgan & Co., bankers, of the city of New York, and treasurer of the Edison Electric Light Company, and all disbursements by or for that company necessarily pass through my accounts as such treasurer.

2. I have read the affidavits of Sawyer, Street, Thatcher and Whitmore, dated the 10th and the 11th of March, in the matter of a motion to reopen the interference between Sawyer and Man and Edison.

3. I have no personal knowledge concerning the matters spoken of in those affidavits, but upon my general information and knowledge as to the company, its affairs and management, I believe that all statements or suggestions that the company or any person who has been in any way requested or authorized by it has given or offered to give to Sawyer or any other person any corrupt inducement to testify in this or any other matter are absolutely and entirely erroneous.

E. P. FABBRI.

Sworn to and subscribed before me this 20th day of April, 1882.

(Endorsement: Affidavit of E. P. Fabbri; U. S. Patent Office, May 8, 1882.)

3351 STATE OF NEW YORK,
County of New York, } *ss:*

Calvin Goddard, being duly sworn, deposes and says:

1. I am of lawful age, a resident of the city of New York, and am secretary of the Edison Electric Light Company.

2. I have read all the affidavits of Street, Sawyer, Thatcher and Whitmore, filed in opposition to the motion to set aside the decision rendered in the interference case, Sawyer and Man *vs.* Edison, and all statements therein made to the effect or from which it might be inferred that the Edison Electric Light Company, or any of its officers, or any person acting as its authorized agent, or any person whatever representing the company with any authority from it, has ever at any time bought or sought to buy any affidavits or testimony whatever, or has agreed or offered to agree to pay William E. Sawyer or any other person, any money or to give any compensation whatever, directly or indirectly, for making any affidavit or giving any testimony, are utterly and entirely false to the best of my knowledge, information and belief, and neither in the case of William E. Sawyer, nor in any other whatever, has this company ever purchased or sought or ever desired to purchase any testimony of any kind or nature.

C. GODDARD.

Sworn to and subscribed before me this 21st day of April, 1882.

WM. H. MEADOWCROFT,
Notary Public, N. Y. County.

(Endorsement: 11; affidavit of Calvin Goddard; U. S. Patent Office, May 8, 1882.).

3352 STATE OF NEW YORK, } ss:
City and County of New York, }

I, Z. F. Wilber, being duly sworn, do hereby depose and say:

1. I am of lawful age and a solicitor of patents by profession, and I am and have been for more than the two years last past in charge of the soliciting of patents for the Edison Electric Light Company, and I am also and have been engaged in many of the interferences arising in the Patent Office upon applications, filed by me as solicitor in their behalf.

2. That on, prior to and for several days subsequent to the 6th and 7th days of March, 1882, I was engaged in preparing papers for a motion in the interference case of Sawyer and Man *vs.* Edison, pending in the United States Patent Office, said motion having for its object the setting aside of the decision rendered and the reopening of the case to permit the introduction of newly discovered evidence which had been brought to my attention after the rendition of the decision in the case.

3. A portion of such newly discovered evidence consisted of certain printed publications attributed to William E. Sawyer, one of the parties in the case, namely, three published in the New York Herald, one under date of December 24, 1879, one under date of January 5, 1881, and one under date of January 6, 1881, each signed as printed in said paper, William E. Sawyer; and also certain passages in a work published by D. Van Nostrand of New York, in 1881, entitled "Electric Lighting by Incandescence and its Application to Interior Illuminations," by William Edward Sawyer.

3353 4. I attached special importance to this evidence, and it seemed exceedingly desirable that it should be gotten into the case. It also seemed proper that the motion to the end should be accompanied by proof establishing at least *prima facie* Mr. Sawyer's authorship thereof. I made endeavors to obtain printed copies of the New York Herald of the dates specified, for attachment to that motion, but the endeavors were fruitless. Being well aware of the unwillingness of newspaper men generally to give voluntarily testimony as to publication in newspapers, I judged that it would be useless to apply to the editor or editors of the paper for voluntary affidavits as to their knowledge of Mr. Sawyer's authorship. I mentioned this matter of the difficulty of obtaining satisfactory *prima facie* proof of authorship in a preliminary proceeding, such as a motion wherein we had no power to compel the testimony of witnesses, to Major S. B. Eaton, vice-president of the company and general manager of its affairs.

5. On the morning of March 6, 1882, Major Eaton sent for me (our offices are in the same building), and on repairing to his office I found him and Mr. Grosvenor P. Lowrey there, whereupon we had a conversation upon the matter of proving the authorship. It was suggested that perhaps Mr. Sawyer himself would admit the naked fact of authorship, and I was asked if I knew him, and I replied, yes. In the conversation It had stated that to hunt up the information, find how the letters reached the Herald, were written, &c., as we had had to do in the case of a letter published in the New York Sun, already in evidence in the case, would entail considerable expense, possibly several hundred dollars. As a matter of ordinary business economy, in order to save if possible, such expenditure and to get the proof of authorship in the simplest form, it was decided that I should see Mr. Sawyer and ask him to formally admit the authorship of the publications referred to. I may here state that, outside of mere routine matters in contested cases,
3354 I take no steps whatever, unless I have first consulted Major
Eaton and have his approval or his instructions.

6. In this matter my instructions went only to this extent, that I should see Mr. Sawyer and obtain, if possible, in proper form his admission of authorship. I was neither directed or authorized to see him on any other matter or point whatever, or to enter into any negotiations with him on this or any other subject whatever, or to offer to him or to promise to him any money or any other consideration in any form whatever, directly or indirectly, for the admission we sought, nor do I remember that any such matters were mentioned or discussed. Nor have I ever made to Mr. Sawyer any proposition as to any affidavit or testimony whatever different from what is hereinafter stated. Nor have I ever offered him any inducement whatever for making any affidavit or giving any evidence, and the affidavit of Mr. Sawyer, so far as it purports to state any material fact concerning my interview with him, is utterly false. The whole of that interview, as to every material fact or circumstance, is correctly and fully hereinafter stated.

7. Although I was exceedingly averse to seeing Mr. Sawyer under the circumstances, I deemed it my duty to. As I believed that he certainly could not object to admitting the naked fact of authorship, I prepared before going to see him an affidavit paper embodying just what, and all that was wanted from him. The identical affidavit paper is now attached to the affidavit of Major S. B. Eaton, dated April 21, 1882, and is there marked Exhibit —. I then on that day sought Mr. Sawyer, at what I had understood to be his office, but found he had moved thence, but ascertained that he lived at the Hotel St. Stephen, on Eleventh street, to which place I went, but word was given at the hotel office that Mr. Sawyer was not in. On the next day,
April 7, I again called there, sent my card up to him,
3355 word was brought to me that he would be down in a minute.
In a few minutes he appeared, greeted me, said he was late in starting to his office, could not I get into his coupé and we would talk as we rode. I assented. I had with me the form of affidavit

before noted, manuscript copies of the letters published in the Herald, and a copy of the book referred to. I opened my business immediately, showing him the copies of the letters and of the book, and asking if he wrote them. He replied that he guessed he did. ("I guess I did" were his exact words.) I then showed him the proposed affidavit I had prepared in advance, and asked him if he would not execute it, so as to put his admission into legal form. He replied that it would cost the Edison Company several hundred dollars to prove what I asked him to admit, and that he would not give that money to the company, that he might as well have that money as notaries and lawyers; that he would give the affidavit for cash-down money, but not without money. I told him that it was a pretty hard thing to do, making a charge for telling a bit of truth which could be proven anyhow. He then took up the talk and made a long statement, saying that he felt kindly towards Edison, that Edison was undoubtedly the real and first inventor of a paper-carbon lamp; that it would so appear if all the facts could be brought out, that he, Sawyer and Man, never were joint inventors of the matters in dispute, that he, Sawyer, had had the original idea, as between himself and Man, that he had had memoranda in his own note books proving this inventorship, which he had destroyed to prevent production in this case, but that he still had letters and other memoranda corroborative thereof, that whatever he and Man had done in the matter resulted unsuccessfully, and that they had totally abandoned the ider of paper carbon for electric lighting and had sought for a proper carbon in another direction long prior to the newspaper accounts of Mr. Edison's success. He stated that evidence existed to fully prove
3356 these things, but that he controlled it, and he didn't propose to give it away for nothing, that he could produce witnesses and documents, if it were made worth his while, fully substantiating every statement he made to me. And thereupon he made a proposition that he would give testimony when called on setting forth the facts he had recited to me, and would furnish witnesses and documentary evidence fully corroborating himself and that he would immediately give the admission of authorship desired for $2,500; $500 to be paid cash down on executing affidavit admitting authorship; $500 in a few days, and $1,500 after he testified. I told him that it was impossible to pay money on any such account, meaning thereby that no evidence would be bought. He undoubtedly construed it to mean that money could not be given outright, for he then said, money need not be paid for it, that all that was necessary was that he be notified that some one would loan him money and he would take some mining stock he had to such party and borrow the money on it. I then told him it was a funny kind of business to engage in, that I didn't see how he could honorably propose such a thing. He went on to say he couldn't help it, that he had two little girls to provide for, that Anderson Little and others had gone back on him after getting all his stock in his light company; that he was very hard up, must raise some cash immediately, and was bound to do it; that the cheapest and easiest way for the

Edison Company to procure their just rights was to enlist his aid in the matter. He called my attention to the fact that in testifying in the case he had so testified that he could easily repudiate any idea of joint inventorship. I then told him I had no authority to enter into any such negotiations; that my power extended only to procurement in legitimate way of proper testimony. He asked me if I wouldn't communicate the proposition to the officers of the company. As I felt it to be politic to be rid of him pleasantly, and to
leave him without his having any such feelings of anger or
3357 animosity as a point-blank refusal of his proposition or re-
fusel to report it might engender in him, I assented thereto, and promised him to do so, and further, at his solicitation, to let him know by 4 p. m. that day, if there was any feeling favorable to his proposition.

8. I, that day, reported my lack of success in my mission to Major Eaton by a report written on the back of the proposed affidavit, which, as before stated, is now attached to the affidavit of Major Eaton in this matter. I also reported the proposition to Major Eaton, who said promptly that the company could go into no such business, that it were better to lose than to win by buying evidence. Accordingly, I had nothing further to communicate to Mr. Sawyer, and therefore did not communicate with him.

9. The entire conversation relative to this matter took place in the coupé. On arriving at his place of business he requested me to go up and see his office, and I did so. It was a front room one flight up. Two or three men, whom I did not particularly notice, were in the room. On the floor was a railroad model, consisting of a few feet of track and a small model of a locomotive thereon. Mr. Sawyer sat down at a desk, I did not sit down; said, "You see I'm on electric railways, too; is it anything like yours?" I told him it didn't look like ours. A few general remarks passed as to the large future in electric inventions generally, and possibly in electric railways, and as to their being room enough in the field for all inventions, after which I left. I was not in his office over three minutes. I had no roll of papers in my hand while there. The few papers I took with me had been exhibited and disposed of, his proposition in the cab and put into my pocket. There was no urging him to sign anything, or to do anything whatever, there were no remarks there or anywhere as to any questions whatever being
reduced to writing.

3358 10. About the same time I had called on Mr. Wm. H. Ar-
noux who was mentioned in one of Mr. Sawyer's Herald letters as the recipient of the lamp, therein alluded to, to ascertain, if possible, its final disposition and whereabouts. Mr. Arnoux promised to enquire and let me know. On March 9, 1882, Major Eaton brought Mr. Arnoux to me saying that Mr. Arnoux saw Mr. Sawyer write one of the Herald letters, and was willing to make affidavit thereto. I immediately drew up a brief affidavit of the facts relating thereto, which Mr. Arnoux executed and which is attached to the motion for reopening now pending. This supplied part of the proof I had asked Sawyer to give us.

11. I did not see Mr. Sawyer again until the 12th day of April, 1882, on which day I received from him a note requesting me to call on him, which note is hereto attached as Exhibit A.

On that day I accordingly called on him at 61 Broadway, in the city of New York, accompanied by my brother, P. B. Wilber. Entering his office, I found him seated at a desk, also a smallish gray-haired and whiskered elderly gentleman, whom I did not know. Mr. Sawyer asked me to take a seat, motioning to me close to him, asked: "Who's that—a friend?" pointing to my brother, just in my rear. I answered him, "He is my brother." I then said to him, "I received your note requesting me to call; what did you send for me for?" His answer was, "I sent to see you about those affidavits in the Patent Office; we've got into a pretty fix over them; can't we yet fix it all up?" I said, "Well, we are in no fix, but we can't satisfactorily explain without any help in fixing up." He then said, "Well, I ought to have heard from you that day; if I had they wouldn't have gone in." My reply was: "I said then if our folks considered favorably of your proposition I would let you know by four that day; as they didn't, I hadn't anything to let you know or see you about." He answered, "My proposition; you 3359 mean yours." I interrupted him, saying, "Look here, Sawyer, it is no use discussing that, for you know you have lied about it in your affidavit, and you will lie again if it suits you." He then said, "I suppose you have brought a witness along to garble this conversation." To which I answered, "Nothing of the kind; I can tell the truth about it; you'll do the garbling and lying, but if this is all your important business, I'll be going—is it?" To which he said, "Well, yes." I thereupon said, "Well, I'll leave, then," and quitted the room. The two conversations hereinbefore detailed are all the conversations I have had with Mr. Sawyer for several years, and they are accurately and fully detailed as to every material matter and circumstance.

New York city, N. Y.

(Endorsement: 12; affidavit of Z. F. Wilber, U. S. Patent Office, May 8, 1882.)

3361 State of New York, City and County of New York, } *ss:*

Philip H. Klein, Jr., being duly sworn, says:

1. I am twenty-four years of age, and reside at 132 Avenue C, in the city of New York, and am employed as book-keeper by Bergmann & Co., electrical-instrument makers, of 108 Wooster street, in said city, Mr. S. Bergmann is the Mr. Bergmann of that firm.

2. I know Robert Street. I saw Mr. Street for the first time in my life at the office of Bergmann & Co. on the 7th day of November, 1881. Mr. Street called and found Mr. Bergmann in his office, which is a small room about ten feet by twenty in size, in which stands my desk. I remained in the room, occupied with my duties, all the time Mr. Street was there. A conversation was carried on between Messrs. Street and Bergmann in an ordinary tone, but I do not remember the conversation, except that after a few minutes Mr. Bergmann turned to me and directed me to draw a check for Mr. Street for one hundred dollars, which I did. Mr. Street and Mr. Bergmann left the room together, Mr. Bergmann saying, "As I am going down town, we can go to the bank and get the money, which will save you trouble." The check was drawn to Mr. Bergmann's order, as all his cash checks are drawn, and it is hereto attached (marked Exhibit A). Mr. Bergmann mentioned at the time, in order that I might understand, as I suppose, for the purpose of keeping his check book, that this was a loan, and I accordingly entered it to Mr. Street on the stub, and I took a receipt therefor in our ordinary receipt book, which receipt I have detached from said book and attached hereto (marked Exhibit B). After that and between that time and the 26th day of January, 1882, Mr. Street called several times to see Mr. Bergmann without finding him in, and on the last occasion asked me to say to Mr. Bergmann that he
3362 wished very much to see him, and was tired climbing the
long stairs, and wanted Mr. Bergmann to come to his office.

3. On the 28th day of January I entered the office and found Mr. Street there with Mr. Bergmann. Mr. Bergmann handed me a paper and asked me to make a copy of it, which I immediately did in Mr. Street's presence. Mr. Bergmann had tried to have it copied by the letter press, but it did not copy well. The letter book, which is in my charge, showed that one page of the letter had been tried but had very imperfectly copied. I cut that sheet out on the 11th

of April, and it is hereto attached (marked Exhibit C). The same sheet was subsequently used for another letter on account of the copying of the first letter being so imperfect, and my assistant bookkeeper informs me, which I believe to be true, that in copying he did not observe that this sheet had been used before.

4. The copy made by me I enclosed to Thomas A. Edison, by direction of Mr. Bergmann, and it is hereto annexed (marked Exhibit D). I never saw Mr. Street again to my knowledge until the 4th day of April, but in the meantime a letter was received at Mr. Bergmann's office, signed by Robert Street, which I sent to Major Eaton, vice-president of Edison Electric Light Company, and which is hereto annexed (marked Exhibit E), and afterwards, on or about its date, Mr. Bergmann received a letter from Major Eaton, which is hereto annexed (marked Exhibit F).

5. On the 5th day of April, 1882, Mr. Bergmann entered his office accompanied by Mr. Street, and by Mr. Bergmann's request I went immediately to the Edison Electric Light Company's office and requested Major Eaton to come to the office or to send some person, and in my presence he requested Mr. Meadowcroft, who is a clerk in his office, to go. I immediately returned with Mr. Meadowcroft there, and
found Mr. R. N. Dyer in the office with Mr. Street and Mr.
3363 Bergmann. After we came in there ensued a conversation,
in which Mr. Bergmann upbraided Mr. Street for trying to injure him with the electric light company, and asked him whether it was not true that the $100 was a loan, to which Mr. Street replied that he could not remember whether it was a loan or what he got it for, but that at any rate he was not going to talk on that subject. Mr. Bergmann repeated the question several times and in different forms, and Mr. Street refused to answer, but he did not deny that the money was received as a loan. Mr. Bergmann then said: "You are a perjurer, and I will have you arrested for it, see if I don't. I can prove that I loaned you that money, and that I have asked you for it several times, in the presence of witnesses, right around the corner here." Mr. Street made no reply to this. After the conversation Mr. Meadowcroft made immediately at the office a minute of the conversation which had taken place, which minute was signed by Messrs. Meadowcroft, Dyer and Bergmann, and also by myself. All that is contained in that statement occurred just as there stated, and it is attached hereto, marked Exhibit G.

6. On the occasion when I copied the letter in January, as Mr. Street went out of the office, Mr. Bergmann said: "I will let Mr. Edison see the paper, and if he wants to do anything of that sort I will let you know." Mr. Bergmann then directed me to send the letter to Major Eaton, adding: "I don't know why this man comes to me to bother me; I don't want to have anything to do with it; it is not my business."

State of New York, }
City and County of New York, } *ss:*

William E. Sawyer, of the city, county and State of New York, being duly sworn, deposes and says, that in his testimony in the interference suit between W. E. Sawyer and Albon Man on the one side, and Thomas A. Edison on the other side, concerning the priority of invention of what is known as the incandescent horseshoe lamp, which suit is now pending in the United States Patent Office, there are numerous errors that, as a matter of simple justice to said Edison, deponent earnestly desires to correct; that deponent has repeatedly asked the attorney prosecuting the interference suit on behalf of Sawyer and Man to permit him, deponent, to correct such errors, but without avail; that deponent has been informed that the suit is about to be decided against Mr. Edison and, notwithstanding the fact that deponent will be the gainer thereby, deponent's sense

of right and justice will not permit him to remain silent and allow injustice to be done; that the said Albon Man and himself, as early as February, 1879, abandoned the horseshoe lamp, after numerous discussions, in the course of which the idea was voted to be a failure; that said Man declined either to himself advance the money necessary to procure a patent, or to permit the Electro-Dynamic Light Co. to pay the same because it would be a mere waste of money, and the entire subject was dropped and not again alluded to until nearly a year later, when an account of Mr. Edison's discovery was published; that then said Man and one C. A. Cheever came to deponent and represented that there was from $100,000 to $250,000 to be made out of the Edison people, if we would put in an interfering application, no matter what it might
be, that the Edison patent was about to issue and no time
3367 must be lost, and papers were drawn which were submitted
to deponent to sign, that upon the representations of said Man that the papers were all right, deponent signed the same without being fully aware of what was claimed; that deponent was then informed that $100,000 would be divided between said Man and his friends and the deponent, as the result of the transaction; that repeatedly thereafter deponent was coached by said Man, and the attorney on behalf of Sawyer and Man, as to what deponent's testimony should be; that deponent informed them that he would not swear to the things desired, but would leave all that to said Man, because deponent could not conscientiously swear to what he believed to be doubtful or false; that it was thereupon arranged that the parts of testimony really affecting the Edison invention should be left to said Man, who has made certain desultory experiments, and that deponent should so leave the matter; and with this understanding between said Man and the attorney and deponent, deponent went upon the stand; that deponent signed deponent's testimony without first reading it and has since found that, already stated, it contains numerous errors, the correction of which deponent deems but an act of right and justice towards said Edison.

And deponent respectfully requests of the Commissioner of Patents the privilege of correcting his testimony in accordance with the facts as known to deponent.

Sworn to and subscribed before me this 26th day of Jan. A. D. 1882.

—— ——.

3368 "EXHIBIT E." April 20, 1882. A. H. Nones, N. P.

W. E. Sawyer. Robert Street.

Sawyer and Street, electrical engineers, 111 Liberty street.

NEW YORK, *Feb. 6th*, 1882.

FRIEND BERGMAN: From what I can understand, the Edison Co. are making fools of themselves; they want us to accede to their wishes, but do not want to make any concessions to us, we were willing to carry out our part to the letter, but their proposals are too one-sided for us. Nothing can be done now under twice the original, and everthing will of course go against the E. Co., as it did in the first place. If they mean any kind of sensible business let me know at once, or let the matter drop forever and the result will be as I have already told you.

Yours, &c., R. STREET.

(Endorsed: 35; 19113; 35; Feb. 6, 1882; S. Bergman, S. B. Eaton; encloses R. Street's letter *re* Sawyer's proposition.)

3369 "EXHIBIT F." April 20, 1882. A. H. Nones, N. P.

The Edison Electric Light Company, 65 Fifth avenue.

Norvin Green, pres.; S. B. Eaton, vice-pres.; E. P. Fabbri, treas; C. Goddard, sec'y.

NEW YORK, *Feb. 6th*, 18—.

S. Bergmann, Esq., city.

DEAR SIR: Referring to your letter of this date enclosing letter from Mr. Street, let me say that Mr. Sawyer's representative called here Saturday with your last communication to him and told me that Mr. Sawyer would do nothing unless he was paid for it. I have already fully discussed the subject of buying an affidavit from Mr. Sawyer, with Mr. Edison, Mr. Lowrey and others of our directors, and we all agree that it would be the most foolish thing in the world for us to do. That is, therefore, the ultimatum of the company in this matter. Please accept my thanks for your kind services in this matter, and believe me we shall always be glad to reciprocate your courteous attention.

Very truly yours, S. B. EATON,
Vice-president.

3370 "EXHIBIT G." April 20, 1882. A. H. Nones, N. P.

Mr. S. Bergmann, R. N. Dyer and W. H. Meadowcroft were all present at an interview between Mr. Bergmann and Robert Street, April 5, 1882, at the office of Bergmann & Co., between 4.30 and 5 o'clock p. m., when the annexed affidavits were read by Mr. Street; after Mr. Street had read the annexed affidavits, Mr. Bergmann asked him if he had made the statements contained therein, to which Mr. Street replied that he couldn't say. He wanted to see the original to see if his signature had been forged. Mr. Bergmann reminded Mr. Street that he (Bergmann) had loaned Street $100 in the presence of a witness and on the distinct understanding that it was a loan. To this Mr. Street made no reply—and Mr. Bergmann again asked Street if he had made the statements contained in the affidavits, to which Street said he did not know, he could not remember. Anyway, he said he was not going to say anything now. Mr. Bergmann then asked him if he (Bergmann) had ever attempted the acts of bribery alleged in the affidavit, to which Street said he could not remember every word that had ever been said to him. Street further said he did not know or remember having made such affidavit. Also he said in reply to a question of Bergmann's that he didn't recollect that Bergmann had done anything to bribe him.

Mr. Bergmann asked him (Street) why he had brought Sawyer's letter to him, Bergmann—to which Street said he wasn't going to say anything now.

Signed by us, April 5, 1882.

WM. H. MEADOWCROFT.
RICHARD N. DYER.
S. BERGMANN.

Witness to all three signatures,
P. H. KLEIN.

3371 City and County of New York, }
State of New York. }

William E. Sawyer, residing at the Hotel Brighton, corner of 42nd St. and Broadway, in the city of New York, being duly sworn, deposes and says that on or about November 5, 1881, while doing business at 111 Liberty St., in said city, deponent's partner, Robert Street, residing at 130 Eldridge St., in said city, came to deponent and said that he had an important matter to communicate, to wit, that one S. Bergmann, a friend of his doing business for T. A. Edison in Wooster St., in said city, had offered him, Street, the sum of one thousand dollars for the purpose of inducing deponent to throw over the side of Sawyer and Man in the interference suit then pending between Sawyer and Man and Thos. A. Edison for what is known as the carbon filament electric incandescent lamp; that deponent was busy and said no more about the matter than to remark it was very singular the Edison people were getting so hard pushed as to have to resort to bribing to secure their patents.

And deponent further states that on or about November 7th, 1881, said Street came to deponent and handed him twenty gold coins of the denomination of five dollars each, saying, "That shows the Edison crowd means business; Bergmann says you will get the rest as soon as you testify for them." Deponent said he did not want the money, but its payment might some day be of use, and he would receive it; and deponent gave two of the coins to said 3372 Street and the remainder he gave away to various persons immediately thereafter.

3373 COMPLAINANT'S EXHIBIT PATENT OFFICE PROCEEDINGS NO. 8.

Decision of Commissioner of Patents on Motion to *to* Open Interference. May 11, 1886. T. G., Ex'r.

CONSOLIDATED ELECTRIC LIGHT CO. }
vs. } H, 3553.
EDISON ELECTRIC LIGHT CO. *et al.* }

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE.

To all persons to whom these presents shall come, Greeting:

This is to certify that the annexed is a true copy from the records of this office of the decision of the Commissioner, July 24, 1882, in the matter of the interference, Edison *vs.* Sawyer and Man, for improvement in electrical lamps.

In testimony whereof I, M. V. Montgomery, Commissioner of Patents, have caused the seal of the Patent Office to be [SEAL.] affixed this 18th day of June, in the year of our Lord one thousand eight hundred and eighty-five, and of the Independence of the United States the one hundred and ninth.

M. V. MONTGOMERY,
Commissioner.

3374 U. S. Patent Office.

EDISON
vs.
SAWYER AND MAN. } Motion to Reopen.

Electrical lamps.

Application of Thomas A. Edison filed December 11th, 1879.

Application of William E. Sawyer and Albon Man filed January 9th, 1880.

Messrs. Dyer & Wilber, for Edison.
Mr. Amos Broadnax for Sawyer and Man.

On January 20, 1882, the examiner of interferences upon the testimony presented in this case, awarded priority of invention of the matter in interference to Sawyer and Man. Appeal from said decision was duly taken by Edison to the board of examiners-in-chief, but prior to the consideration of said appeal, motion was made to reopen the case and allow the taking of further testimony alleged to be newly discovered. Said motion is based upon the affidavits of Z. F. Wilber, George W. Dyer, William E. Sawyer and Anthony Arnoux, and it is claimed that if said testimony is admitted it will establish the following points:

"1st. That Sawyer and Man were not and are not joint inventors in the eyes of the law.

"2d. That whatever either or both did jointly or severally,
3375 in respect of the invention in controversy prior to the filing of their application, amounted only to unsuccessful and abandoned experiments.

"3d. That Sawyer himself, in an enduring and solemn manner, has given Edison credit for the invention of the matter here in issue, taking credit to himself or to himself and Man only for carbon manufactured from hydrocarbon liquids, and 'for live willow twin carbon.'"

In support of the first point the affidavit of William E. Sawyer is filed, dated December 21, 1881, in which he says: "That his testimony given in certain interference suits, before the Commissioner of Patents, in which it inferentially appears that Albon Man was joint inventor of certain inventions not specified, was made upon the erroneous belief that such statement was true; that since such time this deponent has been advised that he was in error, and that such acts of the said Albon Man did not, in law, make him a joint inventor with this deponent."

This affidavit does not identify this case as one in which the testimony was given upon the erroneous belief that Man was a joint inventor with him.

At the hearing certain affidavits were filed on the part of Sawyer and Man, reflecting injuriously upon Mr. Wilbur and others connected with the prosecution of the application of Edison, in reply to which affidavits were filed denying each and every of the injurious statements made by Sawyer and others, in which there is some corroboration and some identification of this case with the matter stated in Sawyer's affidavit above quoted. Standing alone, however, there is not sufficient on this point to warrant the granting of the motion.

In support of the second point, copies of letters are filed purporting to have been written by Sawyer, and published in the New York Herald of dates December 24th, 1879, and January 4th and 6th, 1880.

3376 On the argument it was claimed that these letters showed an abandonment of the invention by Sawyer, if he had ever made it. In reply to this argument my attention was called to certain assignments, of record in this office, by Sawyer and Man to the Electro Dynamic Light Company, of dates anterior to any of said letters, conveying to said company this invention among others, and it is claimed that even if Sawyer did write the letters, he had no right or power to abandon the invention at that time.

If it be conceded that the letters were written by Sawyer, of which I think there is no doubt, and that they had reference to the invention now in issue, I think it must be held that Sawyer at that time had no right or power to abandon the invention, and therefore, so far as abandonment is concerned, the letters are without force and effect.

On the particular point now under consideration, however, said letters have force. In his letter of December 24, 1879, Sawyer says: "If you care to settle the question of priority of invention upon the horseshoe lamp as between Mr. Edison and myself, you may inspect one of those lamps which broke down at No. 94 Walker street about a year ago, and after many experiments was so far condemned that Mr. Man and I concluded we would not waste enough money on it to pay for a patent." Again he says: "To avoid any question, I placed said abandoned institution in the hands of Messrs. Arnoux & Houchhausen, No. 2 Howard street yesterday (Monday) morning at 9 o'clock." In his letter of January 4, he says: "Notwithstanding the assertion that one of Mr. Edison's electric lamps has been running for 240 hours, I still assert, and am prepared to back up my assertions, that Mr. Edison cannot run one of his lamps up to the light of a single gas jet (to be more definite let us call it twelve candle power) for more than three hours."

His letter of January 6, 1880, does not seem to have any-
3377 thing material in it, except to show that it is one of a series
of letters written by Sawyer about that time.

The quotations above given have a tendency, at least, to show that whatever had been done by Sawyer and Man prior to the time said letters were written in relation to the invention herein claimed, was simply experimental, and that their experiments had fallen short of success. Sawyer not only says that their efforts had proven ineffective, and were considered by both himself and Man as worthless, but that the abandoned institution had been placed in the hands of parties where it could be found. In his second letter he very forcibly denies the truthfulness of statements made as to the operativeness of Mr. Edison's lamps. Notwithstanding these letters were written and published, as above stated, on the 9th of January, 1880, an application, executed by Sawyer and Man, describing and claiming the invention in question, was filed in this office.

In a work published by Mr. Sawyer, and received at this office on March 12th, 1881, Mr. Sawyer says on page 72: "The carbonizing of live willow twigs, with a view to obtaining a suitable bent carbon, by Sawyer and Man, and the carbonizing of paper and bamboo by Edison, substantially close the account of incandescent carbon." On page 78 he says: "The filament originally used by Mr. Edison was prepared by cutting card-board into the desired shape, and carbonizing the same by placing the loops thus formed in layers within an iron box with intervening layers of tissue paper, closing the box to exclude oxygen, and raising the whole to red heat in a furnace."

Taking all of the statements of Mr. Sawyer together without further explanation, I am compelled to reach the conclusion that the experiments made by himself and Man were not successful, and that they did not have the invention completed on December 24, 1879.

The statements contained in his book seem to ascribe this particular invention to Mr. Edison, although the book was published a year after the application of Sawyer and Man was made. 3378

Mr. Edison's application was filed on December 11, 1879, in which the invention is fully described and claimed.

The affidavits filed in support of the motion seem to show clearly that this testimony now sought to be introduced is newly discovered. It is urged on behalf of Sawyer and Man that letters published as these were, should have been known to Mr. Edison, or to others within his employ. It cannot be presumed that persons read all that is contained in each of the daily newspapers published in the city of New York, and when it is expressly denied by those who have charge and management of Mr. Edison's matters that they did have such information, and did know of the publication of these letters until after the testimony regularly taken had been completed, I must conclude that such is the fact.

In view of all these facts disclosed by the affidavits filed, I think that Edison should be permitted to prove, if he can, that Sawyer and Man were not joint inventors, and that what experiments were made by them were mere experiments, and did not show a complete invention.

The decision of the examiner of interferences of January 20, 1882, is set aside and the case reopened and he is directed to fix times for the taking of the testimony referred to in this motion, with suitable time for rebutting testimony on the part of Sawyer and Man.

Notice of Motion.

To George W. Dyer, Esq., solicitor for Edison.

Sir: Take notice that upon the hearing of this interference, I will move the honorable Commissioner of Patents, or such other officer in the Patent Office as may have cognizance of the same, that the whole of the depositions of Alexander Walsh and Robert White taken in this interference to rebut the testimony on behalf of Edison under the Commissioner's order to open the case, dated July 24, 1882, be received in evidence notwithstanding the fact that some parts of said depositions are objected to upon the grounds that the same is incompetent under the said order of the Commissioner, and tha- upon the hearing of said motion I will use the record in this case and also certain affidavit, copies of which are hereto annexed.

AMOS BROADNAX,
Attorney for Sawyer and Man.

Dated March 6, 1885.

WASHINGTON, D. C., *March* 8, 1883.

Good service.

GEO. W. DYER
For Edison.

3389 In the United States Patent Office.

WILLIAM E. SAWYER and ALBON MAN
vs.
THOMAS E. EDISON.

Interference, carbons for electric lights.

Motion.

To the honorable Commissioner of Patents:

In the above-entitled cause it is moved on behalf of Sawyer and Man that the whole of the depositions of Alexander Walsh and Robert White, taken in this interference to rebut the testimony on behalf of Edison, under the Commissioner's order to open the case, dated July 24, 1882, be received in evidence notwithstanding the fact that some parts of said depositions are objected to upon the ground that the same is incompetent under said order of the Commissioner. In support of the foregoing motion the following affidavit is respectfully submitted.

AMOS BROADNAX,
Att'y for Sawyer and Man.

Dated March 6, 1883.

CITY, COUNTY, AND STATE OF NEW YORK, *ss:*

Amos Broadnax, being duly sworn, says that he is an at-
3390 torney and counsellor-at-law, and as such has conducted the proceedings in the above-entitled interference on behalf of Sawyer and Man, and is familiar with all the facts and circumstances attending the production and taking the testimony on their behalf; that the facts sworn to by said Walsh and White were unknown to deponent at the time of taking the rebutting testimony on behalf of Sawyer and Man; that at the time of taking such testimony both of said witnesses were in the employ of said Edison, and that the testimony and evidence adduced and given by them

was entirely unknown to this deponent, and, as he verily believes, to Sawyer and Man and to those holding under them; that said testimony is newly discovered evidence, and was unknown to deponent and, as he verily believes, was unknown to any of the parties in interest under Sawyer and Man until within a very short time before said depositions were taken; that said depositions were taken on due notice to the adverse parties, and upon cross-examination by counsel; that said depositions are pertinent and material, and, in the judgment of deponent, ought to be received in evidence; that the ends of justice require that said depositions should be considered as part of the evidence in this case in that they rebut fully and fairly important parts of the case on behalf of Edison, as will appear by the depositions themselves and by the record already in.

AMOS BROADNAX.

Sworn to and subscribed before me this 6th day of March, 1883.

[L. S.] J. EDGAR BULL,
Notary Public, New York Co., N. Y.

3391 (Endorsement: Sawyer and Man *v.* Edison. Motion filed by Sawyer and Man. (Endorsement: 12189; D., '85.)

3395 In Interference—SAWYER AND MAN *vs.* EDISON. } Paper Carbons for Incandescent Electric Lamps.

Present: George W. Dyer, counsel for Edison, and Amos Broadnax, counsel for Sawyer and Man.

Parties met pursuant to agreement, at the office of Amos Broadnax, at No. 10 Pine street, 11th October, 1882.

Counsel for Edison, in behalf of Edison, puts in testimony a book entitled "Electric Lighting by Incandescence," by William Edward Sawyer, published by D. Van Nostrand, of New York, 1881. The same is marked Edison Exhibit "Sawyer Book."

Book objected to by counsel for Sawyer and Man as incompetent, irrelevant and immaterial, and not evidence in any sense.

Counsel for Edison also puts in evidence copy of the New York Herald, of December 24, 1879, and the same is marked Edison Exhibit "Herald, December 24, 1879."

Also copy of the New York Herald of January 5, 1880; the same is marked Edison Exhibit "Herald, January 5, 1880."

Also copy of New York Herald of January 6, 1880; the same is marked Edison Exhibit "Herald, January 6, 1880," 11th October, 1882, J. E. B.

Counsel for Sawyer and Man enters the same objection to the said papers that he entered to said book.

3396 Counsel for Sawyer and Man admits that the book marked Edison Exhibit Sawyer Book was written and published by William E. Sawyer, one of the parties of this interference, at the date set down in said book, and that letters signed W. E. Sawyer, in the New York Herald of December 24, 1979, and January 5 and January 6, 1880, were written and published by William E. Sawyer one of the parties to this interference, at the date shown in said newspapers; but counsel for Sawyer and Man, nevertheless, reserves his right to use all legal objections against the said book and said articles in said newspapers, excepting the fact that the book and said articles in said newspapers were written and published by William E. Sawyer; and counsel for Sawyer and Man reserves especially the right to show that William E. Sawyer is not now and never has been a party in interest to this interference; and that at the time he wrote the letters in the newspapers put in evidence he did not own the whole or any part of the invention in controversy excepting as a mere stockholder in the Electro-Dynamic Light, Company; and that at the time he wrote the book in question he had no interest whatever in the inventions; that he was openly hostile to the owners of said inventions, patents and the other patents granted to said Sawyer and Man; that one of his avowed purposes in writing said book was to destroy and injure the patents and inventions theretofore made and obtained by William E. Sawyer and Alban Man, both jointly and severally, meaning so many of them as were then owned by the Electro-Dynamic Light Company, and that the statements in said books in many particulars are false and

malicious. And counsel for Sawyer and Man gives notice to counsel for Edison that as he understands the decision of the Commissioner, he may put in rebutting testimony, not only to the book and the newspaper articles, but also to the testimony-in-chief put in on behalf of Mr. Edison, and that if the counsel for Mr. Edi-
3397 son has a different understanding of the Commissioner's decision, then he gives notice that he will move the Commissioner immediately, or as soon as he can prepare the necessary papers for leave to put in such testimony and request counsel for Edison to state upon the record whether he agrees with counsel for Sawyer and Man as to his right to put in such rebutting testimony under the decision of the Commissioner in opening his decision.

Counsel for Edison accepts the notice above given, and states that he does not know what construction will be given to the order of the Commissioner in reopening the case.

Counsel for Edison further gives notice that he here closes his testimony.

[SEAL]

J. EDGAR BULL,
Notary Public, N. Y. Co., N. Y.

(Endorsement: U. S. Patent Office, March 16, 1883. Ex'd: J. A. M., M. McK.)

3398 United States Patent Office.

SAWYER AND MAN
vs.
EDISON.
In Interference. Paper Carbons for Incandescent Electric Lamps.

Present: George W. Dyer, counsel of Edison, and Amos Broadnax, counsel for Sawyer and Man.

Parties met pursuant to agreement, at the office of Amos Broadnax, No. 10 Pine street, New York, November 9, 1882.

ALEXANDER WELSH, a witness produced on behalf of Sawyer and Man, being duly sworn, in answer to interrogatories propounded by AMOS BROADNAX, testified as follows:

1 Q. What is your name, age, residence, and occupation?

A. My name is Alexander Welsh; I am twenty-six years of age; I reside in Jersey City, New Jersey; am carbonizer and experimenter; my street address is No. 93 Manderville avenue.

2 Q. You say that your occupation is that of a carbonizer; do you mean by that that you are engaged in carbonizing or making carbons to be used in electric lighting?

A. I do.

3 Q. What kind of electric lighting—arc lighting or incandescent lighting?

A. Incandescent.

4 Q. Where are you at present employed?

A. By the Consolidated Electric Light Company, at the corner of Front and Adams streets, Brooklyn, New York.

5 Q. How long have you been employed by the Consoli-
3399 dated Electric Light Company, and its predecessor, the
American Electric Light Company, if you were employed at
all by the American Electric Light Company?

A. I was employed by the Consolidated, and its predecessor, the American Electric Light Company, from the middle of March last (*i. e.*, 1882).

6 Q. Previous to your employment by the Consolidated Electric Light Company, were you employed by the American Electric Light Company, as carbonizer?

A. Yes.

7 Q. Previous to your employment by the American Electric Light —, where and by whom were you employed?

A. By the Edison Lamp Company, at Menlo Park.

8 Q. When did you go into the employ of the Edison Electric Lamp Company, at Menlo Park?

A. To the best of my recollection it was about October, 1879.

9 Q. Are you acquainted with Thomas A. Edison, one of the parties to the interference?

A. Yes.

10 Q. What were you employed to do, and what, in fact, did you do, when you commenced your employment with the Edison Lamp Company, at Menlo Park?

A. I set or fastened carbons to the electrodes; measured resistances of carbon; got up lamps for patenting purpose—that is "model lamps," and assisted in experimental work in connection with the incandescent system.

11 Q. What, if anything, did you have to do with making of the carbon for incandescent lighting when you went in the employ of the Edison Light Company?

A. I had nothing to do at first with making of carbons; but handled all the carbons that were then made; and some time afterward was given full charge of the carbonizing.

3400 12 Q. How long had you been in the employ of the Edi-
son Lamp Company before you began to assist in making
the carbons?

A. From three to four months.

13 Q. How long did you remain in the employ of the Edison Lamp Company?

A. Till the 1st of February, 1882.

14 Q. State, if you know, whether or not at the time you went in the employ of the Edison Lamp Company they were making carbons for incandescent lighting, of paper?

A. They were.

15 Q. State, if you know, how long they had been making such carbons of paper at the time you went there.

Question objected to by counsel for Edison as involving matters *for* which the witness could have had no personal knowledge; and for the further reason that it calls for evidence not rebutting in its character, and not authorized by the decision of the Commissioner in reopening this interference. Question withdrawn.

16 Q. State whether or not, at the time you went in the employ of the Edison Lamp Company Mr. Edison and the employees of that company were engaged in experimenting with carbons made of paper for incandescent electric lighting.

Question objected to on the ground that it calls for evidence not rebutting in its character, and not authorized by the decision of the Commissioner in reopening this interference.

Counsel for Sawyer and Man responds, that, according to his understanding of the Commissioner's decision, he has the right to rebut now any of the testimony put in on behalf of Edison, 3401 and that at the proper time, and upon proper notice; he will move the Commissioner for leave to read any testimony he may now put in to rebut any testimony heretofore put in on behalf of Edison.

A. They were.

17 Q. State, if you know, what kind of paper they were experimenting with.

Same objection.

A. Blotting paper, bristol or card board, tissue paper, parchmentized paper, bank-note paper and various other kinds of paper, the names of which I do not now remember.

18 Q. State whether or not they succeeded in making carbons of blotting paper and used them in their lamps successfully for incandescent electric lighting.

Same objection.

A. Blotting paper was carbonized successfully and was used in quite a number of lamps.

19 Q. When was that?

Same objection.

A. Blotting paper was used in a number of experiments at various times as late as the summer of 1881.

20 Q. State, if you know, when it was that blotting paper was first used by Mr. Edison for incandescent electric lighting.

Same objection.

A. To the best of my recollection, somewhere about the latter part of 1878; I could not say positively that it was blotting paper. My information comes in this way, it comes from lamps that were there and said to have carbons made of blotting paper, with dates on the lamps.

21 Q Do you know, of your own knowledge, whether those lamps had paper carbons in them or not?

Same objection.

3402 A. I do not.

22 Q. State when, of your own knowledge, you first knew

blotting paper to be used by Mr. Edison and his employees for making carbons for incandescent electric lighting.

Same objection.

A. Winter of 1879–'80.

23 Q. State when, of your own knowledge, you first knew of Mr. Edison and his employees using paper to make carbons for incandescent electric lighting.

Same objection.

A. Winter of 1879–'80.

24 Q. State, if you know, to what extent blotting paper was used by Edison and his employees to make carbons of for incandescent electric lighting, and to what extent the carbons were used in the lamps.

Same objection.

A. A large number of carbons were made from very thin blotting paper together with some other kinds of paper, carbonized and used as incandescent conductors in his lamp. A large number of the carbonized blotting paper loops were sealed in lamps and placed in circuit about Menlo Park.

25 Q. Did you carbonize any of these loops yourself and place them in the lamps?

Same objection.

A. I did.

26 Q. Many of them?

Same objection.

A. I should say a hundred or more.

27 Q. State, if you know, whether these carbons were illuminated to incandescence in these lamps.

Same objection.

3403 A. They were.

28 Q. State, if you know, for how long a time these loops were kept at a state of incandescence.

Same objection.

A. I have known the loops to the lamps to be burned in the photometer room at what was supposed to be forty-eight candle power for many days; and also many of the lamps containing these carbons were burnt outside, in and around the buildings of the park, for a long time.

29 Q. Did you remain continually in the employ of the Edison Lamp Company at Menlo Park from October, 1879, until the time you left there in February, 1882?

A. I did.

30 Q. State, if you recollect, of making any specimens of paper carbon in narrow strips in the early part of July, 1881?

Same objection.

A. I do recollect it.

31 Q. State, if you recollect, what paper you used in making those carbons.

Same objection.

A. Blotting paper, bristol and card board, tissue paper; there may have been others, but I don't recollect.

32 Q. Upon whose request or direction did you make those specimens?

Same objection.

A. Made at the request of Mr. Charles Batchelor, by note delivered to me by Mr. Atchison.

33 Q. Have you got that note?

Same objection.

3404 A. I have not.

34 Q. State as near as you can when you made those specimens of carbon?

Same objection.

A. They were made in the early part of July, and shortly before the taking of testimony in this case, as I know from the fact that Mr. Batchelor told me personally that the strips so carbonized were to be used as exhibits in this case.

Counsel for Edison objects to so much of the preceding answer as relates to witness' conversation with Mr. Batchelor, on the ground of being hearsay evidence.

35 Q. Referring now to the specimens of carbon made of blotting paper, please to describe exactly how those carbons were made.

Same objection.

A. The pieces of blotting paper were placed upright in an iron mould, the dimensions of which were about four inches high, four or five inches long, and about an inch and a half or two inches in width; the spaces between the sheets of paper, and also between the sheets of paper and the sides of the mould, were filled with powdered charcoal; the base of the mould, which, in this case, was used as a cover, was then luted around the edge with pipe clay, and then pressed down on the opening of the iron mould; it was then placed in the fire-pot of the steam boiler and allowed to remain until it reached a red heat, which was about a half hour's time; it was then taken out, placed on an iron table, cold water was then thrown on the mould, and in a few minutes the cover removed; the contents being red at the time of removal, the air coming in contact with the heated material caused it to oxydize, and the paper carbons were thereby injured.

3405 36 Q. During the carbonization of the paper in this box, was there any pressure upon the carbon, either by the lid of the box, or anything put in the box for that purpose?

Same objection.

TRANSCRIPT OF RECORD.

SUPREME COURT OF THE UNITED STATES.

OCTOBER TERM, [illegible]

No. [illegible]

THE CONSOLIDATED ELECTRIC LIGHT COMPANY,
APPELLANT,

vs.

THE McKEESPORT LIGHT COMPANY.

APPEAL FROM THE CIRCUIT COURT OF THE UNITED STATES FOR
THE WESTERN DISTRICT OF PENNSYLVANIA.

FILED OCTOBER 17, [illegible]

(14,326.)

A. No pressure other than the pressure of the charcoal.

37 Q. Of what quality were these carbons after they were taken out of the box?

Same objection.

A. About as poor as could be.

38 —. Why were they such poor carbons? I mean what was the cause of the carbons being so poor?

Same objection.

A. Imperfect carbonization and oxydization.

39 Q. How should they have been treated to obtain a good carbonization, or as good as could have been obtained in that box?

Same objection.

A. They should have been held down by weights both upon and between the layers of blotting paper; then the box carefully filled with charcoal; the base or cover fastened securely with good luting; then placed in the furnace with scarcely any perceptible heat at first, and kept there for about four hours under slowly increasing heat. After removal from the furnace the mould should be allowed to cool naturally in the open air until the mould became perfectly cold, and the contents then removed.

40 Q. Please to state why you did not treat the blotting paper in the manner last described by you, so as to obtain the best results you could under the circumstances?

Same objection.

3406 A. I was directed by Mr. Batchelor to turn the carbons out in the shape and manner first described, as they would be used as exhibits in this cause, and he was not particular, as the points he desired to prove could be easily proven by such specimens.

41 Q. Why did he throw water on the hot box instead of allowing it to cool gradually in the air?

Same objection.

A. He did that in order that Mr. Batchelor might get the carbonized blotting paper that morning in order to take it into New York.

42 Q. Why could he not wait until the box cooled without throwing water on it?

Same objection.

A. Because he was anxious to take the specimen into New York by the 8-o'clock train, to use them as exhibits in this case, and as quarter before 8 the box was taken from the fire-pot, under the steam boiler, it was necessary, in order to cool it in time, to pour water on it.

43 Q. In your opinion, did the pouring of water on the box, and opening the box before it had time to cool, injure the carbons and render them of even poorer quality than they would have been had the box been allowed to cool gradually without the water?

Same objection.

A. Yes.

44 Q. Were all the specimens of carbon that you made at that time for Mr. Batchelor made by treating the paper in the same way the blotting paper was treated?

Same objection.

A. There was a slight difference in the treatment.

45 Q. How was the other paper treated, of which the other specimens were made?

Same objection.

3407 A. The other papers were placed in an iron box the same kind as before described, in the same manner as before described, with the exception of the tissue paper, which was laid between carbon in plate form, and nickel plates, and then filled in and around with charcoal. They were then placed in the furnace, and allowed to remain from a half an hour to an hour, or until they reached a dull-red heat; they were then taken out, placed on a table, allowed to remain until they became quite cool; they were then taken out.

The card-board was placed in the moulds before described, some in layers with the spaces filled with charcoal, and in other instances the card-board was fastened together, a number of layers by means of mucilage, glue, and paste made of flour and water. These were in like manner placed in moulds, and the powdered charcoal only put around them.

46 Q. Referring to the carbon made of the card-board and the tissue paper, were they also heated in the furnace of the boiler?

Same objection.

A. They were not.

47 Q. In what kind of a furnace were they heated, and to what degree of heat, and during what time were they subjected to the heat?

Same objection.

A. They were heated in a revibratory furnace, which was especially for carbonizing, and were allowed to remain there from half an hour to an hour; were only dull red in color, and must have been at a very low degree of heat. After being taken from the furnace, they were allowed to remain there until they became quite cool, so you could bear your hands on them easily. They were so cool that there was no chance of their oxydizing.

3408 & 3409 48 Q. Were the boxes cooled by throwing water on them, or were they allowed to cool by mere radiation in the atmosphere?

Same objection.

A. No water was thrown on the boxes. They were allowed to cool by radiation in the atmosphere, and were about two hours in cooling.

49 Q. Referring now to the tissue-paper carbon and the cardboard carbon, what condition were they in when taken out of the box; I mean of what quality was the carbon?

Same objection.

A. The carbon was poor, but only owing to the fact of incomplete carbonization.

50 Q. Referring now to the carbon specimens of carbon made of blotting paper, what was done with them after they were taken out of the box?

Same objection.

A. The carbons made of blotting paper showed signs of oxidation, or, in other words, were white in places where they had been burnt, and also were wet in places. The white portions were cut off or scraped off. They were then placed in a box and sent immediately to the station where Mr. Batchelor was then waiting. That's the last I saw of them.

51 Q. Of what shape was the box in which they were placed?

Same objection.

A. To the best of my recollection it was a brown-paper box about four inches square and three inches in height, which had formerly contained some hardware, I think door knobs.

52 Q. Were all the specimens of carbon put in that box?

Same objection.

3410 A. Only the specimens of blotting paper.

53 Q. How many specimens were there of blotting-paper carbon?

Same objection.

A. I think about eight in number.

54 Q. Please to give the size of the specimens as near as you can recollect.

Same objection.

A. They were of various thicknesses; of from extremely thin to paper about one-sixteenth of an inch in thickness; some of the pieces were in strips of from three to four inches in length, one-half inch to one inch in width; and other pieces were in squares of from three to four inches; some of the paper was very nearly one-eighth of an inch in thickness.

55 Q. When you made these specimens of carbon from blotting paper was Mr. Charles Batchelor present?

Same objection.

A. He was not.

56 Q. Who was present?

Same objection.

A. A young man by the name of Robert White, who fired for me at that time, and myself were the only ones present.

57 Q. Is that true as to all the specimens you made at that time?

Same objection.

A. Yes, sir.

58 Q. During the time you were in the employ of the Edison Electric Lamp Company did you make any other specimens of carbon to be used as exhibits in any case?

Same objection.

3411 A. I did not.

59 Q. How long after you went in the employ of that company was it before you had charge of the carbonizing department?

Same objection.

A. About three to four months.

60 Q. How much of your time since that has been given to the carbonization of different materials for incandescent electric lighting?

Same objection.

A. My whole time.

61 Q. Is there any difficulty in making a good practical illuminating carbon conductor for incandescent electric lighting, of blotting paper?

Same objection.

A. There is not.

Direct examination closed.

Counsel for Edison, not waiving any of his rights of objection, or waiving the objections heretofore made, proceeds to the cross-examination of this witness.

62 X Q. At what time of the day or night was it when you began to make these specimens you have just testified about?

A. The specimens of bristol or card board, tissue paper, either in sheets or fastened together by the materials named, were made in the afternoon and evening of the day or two before the blotting paper was made; the blotting paper was made in the morning; was put in the fire-pot of the steam boiler about 7.15, or somewhere about that time; was taken out about a quarter to eight.

63 X Q. Was Mr. Charles Batchelor present when the specimen from card or bristol board or tissue paper were made?

3412 A. He was not.

64 X Q. Then, as I understand, he was not present at any time during the making of any of these specimens, is that so?

A. It is.

65 X Q. Did you have any conference with him as to the way in which the specimens were to be made?

A. I had no conference with him in regard to the manner in which the specimens were to *made be,* except such directions as were given me in the note delivered me by Mr. Atchison; and the fact of his telling me that he was not particular about them.

66 X Q. When and where did he tell you that.

A. In the office of the lamp factory on the night previous to the carbonization of the blotting paper.

67 X Q. Was any one else present?

A. No, sir.

68 X Q. Have you read the testimony of Charles Batchelor about these exhibits?

A. No, sir.

69 X Q. Or heard it read?

A. No, sir.

70 X Q. Has not th*a* substance of it been stated to you?

A. No, sir.

71 X Q. Did you write or send any message to Mr. Batchelor after these specimens were made?

A. I sent no message to Mr. Batchelor, except an inquiry upon receipt of the note from him, through Mr. Atchison, as to what kind of carbons he wanted.

72 X Q. By whom did you send that inquiry or message?

A. I'm not positive; but my recollection is it was one of the young men in my department.

73 X Q. What were the names of these young men?

A. I don't recollect. There were so many changes that I don't recollect who were in there at that time.

74 X Q. Do you remember the names of any of them?

3413 A. One was a young man by the name of Orion Fords; another. Harry Slate; another man about forty years of age, named Brennan; another by the name of Robert White. There may have been some others; but I am not positive of any others.

75 X Q. Where is Robert White now?

A. I don't know where he is now.

76 X Q. Where was he the last you heard from him?

A. I saw him some time ago, and then understood he was going to work for the Steam Heating Company.

77 X Q. Did you have any directions from Mr. Batchelor to use water to cool off the carbonizing box about which you testified?

A. I did not.

78 X Q. Did you have any directions from Mr. Batchelor about the length of time the mould should be in the fire-pot of the steam boiler?

A. I did not.

79 X Q. Or about the length of time the mould should be in the furnace?

A. I did.

80 X Q. Did you understand that you made the specimens of bristol card-board and tissue paper substantially in accordance with Mr. Batchelor's instructions?

A. I did.

81 X Q. When and where was it that Mr. Batchelor told you that these specimens were to be used as exhibits?

A. In the office of the lamp factory, on the night previous to the carbonization of the blotting paper.

82 X Q. Was that your first knowledge that they were to be so used?

A. No, sir.

83 X Q. How did you get the first information of that fact?

A. To the best of my recollection, it was through Mr. Atchison, the bearer of the note to me.

84 X Q. Was this when he brought the note?

3414 A. It was.

85 X Q. Why didn't you make the blotting-paper specimens at the time you made the others, or immediately after?

A. Because they weren't ready.

86 X Q. What was needed to be done to make them ready?

A. The blotting paper was left by mistake at the laboratory, and they neglected to send it down until the last moment.

87 X Q. Why couldn't you have sent for it?

A. In the first place I wasn't anxious to do the work, because it was to be done so poorly, and also because Mr. Atchison told me that it would be brought down.

88 X Q. Do you know where Mr. Atchison is now?

A. He is in Europe somewhere; I couldn't say where.

89 X Q. Do you know where Mr. Batchelor is now?

A. Mr. Batchelor is in Europe.

90 X Q. Did you understand at the time that these exhibits were to illustrate methods of carbonization previously employed by Sawyer and Man?

A. I do not know about that. No; I did not understand that they were to be used for that purpose.

Examination adjourned until 10 o'clock, a. m., November 10, 1882.

NOVEMBER 10, 1882.

Cross-examination of Mr. WELSH continued:

Witness wishes to correct his answers to the 88th and 89th X Q's by the statement that he does not know positively that Messrs. Batchelor and Atchison are now in Europe, but that he had heard that they are.

Witness continues his answer to X Q. 90, as follows:

3415 I did not understand that those carbon specimens were intended to represent the Sawyer-Man method, but were intended to prove that the Sawyer-Man method was impractical.

91 X Q. Did you hear Robert White testify in this cause to-day?

A. I did.

92 X Q. Did his statement agree with your recollection of the transaction?

A. Except in some few particulars it did, one was with reference to the time when the carbons were placed in the fire pot of the steam-boiler furnace; and another, as to whether Mr. Francis Upton was present at the time the blotting paper was prepared.

93 X Q. At what time did you commence work in the morning in July, 1881, at Menlo Park?

A. About 7 a. m.

84 X Q. Was the boiler making steam at that hour?

A. I think it was.

95 X Q. Have you any independent recollection of the time consumed in the carbon blotting-paper experiment or specimens, independent of the time of commencing work at 7 o'clock, and the train leaving at 8?

A. I haven't exactly an independent recollection of that, but I can say positively that not more than one hour was consumed in placing the papers in the box, carbonizing them, and taking them out.

96 X Q. What was your business or occupation before you commenced at Menlo Park?

A. The export commission business.

97 X Q. Where was that business carried on, and for how long a time?

A. Carried at No. 10 Murray street, New York city, and I think up to about August, 1879.

98 X Q. Beginning at that date?

A. I was in the business about three years.

99 X Q. After you had charge of carbonizing at Menlo Park, did you continue in such charge the remainder of the time you were there?

3416 A. I did.

100 X Q. Why did you leave at all?

A. I left on account of difficulties with Mr. Upton.

101 X Q. Did he discharge you?

A. He did not.

102 X Q. You left voluntarily, did you?

A. I was suspended until such time as we should reach East Newark, and immediately came to New York and went into the employ of the isolated department of the Edison Company.

103 X Q. How long were you in their employ?

A. Until the middle of March, 1882.

104 X Q. Why did you leave their employ?

A. Because I was dissatisfied with the employment and treatment, and felt assured of doing better elsewhere.

105 X Q. What was the nature of your difficulty with Mr. Upton?

A. Because he made promises which he failed to fulfill, which led, in consequence, to a very bad feeling between us.

106 X Q. Didn't he complain to you that you were incompetent and untruthful?

A. He did not.

Redirect examination of witness:

107 R. D. Q. Did you go to Robert White's house to see him, or did you send him a note stating that you wanted to see him?

A. I went to his house to see him.

108 R. D. Q. Did you see him?

A. I did.

109 R. D. Q. When?

A. Last night about 6 p. m.

110 R. D. Q. But previous to that when did you last see him?

3417 A. I think it was about two months ago—maybe longer.

111 R. D. Q. When did you first learn that Mr. Atchison and Mr. Batchelor were in Europe?

A. They left the Park for Europe while I was there and I knew of letters being received by parties in the Park from them.

112 R. D. Q. That does not prove that they are in Europe now. How do you know they are in Europe now?

A. I only know from the fact that I was told so by some gentlemen at 65 Fifth avenue, about a month or so ago.

113 R. D. Q. Is that the last information you have as to their whereabouts?

A. It is.

114 R. D. Q. You say in answer to 102 X Q., that you were "suspended until such time as we should reach East Newark;" what do you mean by that? Where were you when Mr. Upton suspended you, if Mr. Upton did suspend you?

A. I was at Menlo Park, and was informed by Mr. Upton that a line of experiments were to be carried on previous to the removal to East Newark, and that they were not going to run regularly for the time; he said that they would not need me until they got down to East Newark.

115 R. D. Q. And was it for that reason that you were suspended?

A. That was the only reason given me by Mr. Upton or any one else.

116 R. D. Q. Have you since been solicited to return to the employ of Mr. Edison?

A. I have.

117 R. D. Q. By whom?

A. By Mr. Upton, at No. 65 Fifth avenue, N. Y., in the month, I think, of March, 1882, and since that time have had some talk about returning to the Edison Company, but nothing definitely settled upon.

3418 118 R. D. Q. With whom did you have this last-mentioned talk?

A. I think with Mr. Vail, at 65 Fifth avenue, N. Y., and some other of the gentlemen whose names I don't remember; and also with Mr. Mackinsey, at the Pearl-street station of the Edison Company about a month ago.

Cross-examination :

119 X Q. What Mr. Vail was that?

A. Superintendent of the isolated department.

120 X Q. What Mackinsey was it?

A. I don't know his first name, but saw him at Menlo Park, where he was engaged to do experimental work, as I understood, and whom I believe, was considered a great friend of Mr. Edison.

121 X Q. What did Mackinsey do at the Pearl-street station?

A. I don't know.

122 X Q. Is he a middle-age man?

A. I should say he was about forty, or a little over.

123 X Q. What kind of a looking man?

A. Large man, with full beard.

ALEX. WELSH.

Subscribed and sworn to before me, this 10th day of November, 1882.

J. EDGAR BULL,
Notary Public, N. Y. Co., N. Y.

3419 *Second Deposition.*

Parties met pursuant to adjournment.

Present: Counsel as before.

Alexander Welsh, a witness recalled on behalf of Sawyer and Man, in answer to interrogatories propounded by Mr. Broadnax, testified as follows:

1 Q. State, if you please, whether you have been sworn and testified in this case before.

A. I have.

2 Q. State whether or not since you gave your testimony in this case before, you have made any carbons of paper.

A. I have.

3 Q. Please to state what kind of paper you used to make such carbons of.

A. Ordinary blotting paper.

4 Q. Please to produce any samples of the blotting paper you may have, of which you made such carbons.

A. I here hand you a piece of blotting paper such as I used in making such carbons.

Sample of blotting paper produced by witness offered in evidence and marked Welsh's Exhibit Blotting Paper.

Objected to as being new testimony, not contemplated or covered by the decision of the commissioner in reopening this interference.

5 Q. Please to state how many specimens of carbon you made of blotting paper since your last examination, and please to produce your first specimens, or lot of specimens, you have made.

Same objection.

A. I don't know the exact number of specimens,
3420 & 3421 but I have here a number of specimens made of the
first lot, some of which are in single sheets or pieces,
and in other cases, where several sheets were fastened together by mucilage, glue, and in one instance, where two sheets of paper are carbonized together by merely laying one on the other.

Same objection.

6 Q. Do you mean by your last answer that, in some cases, you stuck two or more thicknesses of blotting paper together with mucilage or glue, and carbonized them in that way?

Same objection.

A. I do.

7 Q. And in some instances you carbonized the paper of single thickness?

Same objection.

A. I did.

8 Q. Please to state when you made these specimens of carbon.

Same objection.

A. The first lot were made on the 14th of this month, on Tuesday.

9 Q. Please to produce the specimens of carbon made by you on that occasion.

Same objection.

A. I now do. I produce first the specimens made of single thickness of blotting paper.

Specimens offered in evidence, marked "Welsh's Exhibit First Lot of Blotting-paper Carbon, single thickness."

3422 I next produce two specimens of blotting-paper carbon of
two thicknesses of blotting paper. These were carbonized
by merely laying one sheet upon the other.

Specimen offered in evidence, and marked "Welsh's Exhibit Blotting-paper Carbon, two thicknesses, first lot."

I next produce one specimen of carbon of four thicknesses of blotting paper stuck together by mucilage, then pressed in a vise and carbonized.

Specimen offered in evidence, and marked "Welsh's Exhibit Blotting-paper Carbon, four thicknesses, first lot, mucilage."

I next produce one specimen of carbon of four thicknesses of blotting paper stuck together with glue, pressed in a vise and carbonized.

Specimen offered in evidence, and marked "Welsh's Exhibit Blotting-paper Carbon, four thicknesses, first lot, glue."

Same objection.

10 Q. Please to state whether you carbonized all of these several specimens at one time.

Same objection.

A. I did.

11 Q. Please to describe exactly how you carbonized them.

Same objection.

A. I first took the iron box which I now produce and poured in charcoal to the depth of about one-half inch, and pressed it down with a piece of wood with another small piece fastened crosswise on the end. I then placed some sheets of blotting paper on the charcoal, then sprinkled charcoal on the blotting paper, and
3423 pressed it down gently with a piece of wood, then placed in more paper and charcoal until the box was filled, all being pressed down with a stick or piece of wood. I then took the lid or cover to the box and fastened it to the box by a clay luting. I then placed the box in a blacksmith's portable forge and kept it there about an hour, bringing the box to a cherry-red heat. I then took the box from the fire and allowed it to cool before taking the contents out. I took the contents out and brought them over here within a day or so afterwards and gave them to you.

The iron box produced by the witness as having been used by the witness in making the carbon offered in evidence and marked "Welsh's Exhibit First Iron Box."

12 Q. Please to state whether you subsequently made a second lot of blotting-paper carbons, and if so, when you made them.

Same objection as before.

A. I did, on the 17th inst.

13 Q. Please to produce, if you can, any specimens of blotting paper of which you made the second lot of carbon.

Same objection.

A. I can't produce a specimen of blotting paper the same as was used in making the second lot of carbons, but the blotting paper was exactly the same as has been already offered in evidence accompanying first lot.

14 Q. Please to produce such specimens of carbon as you may have of the second lot.

Same objection.

A. I first produce twelve carbon loops or horseshoes made from blotting paper, also several sheets of blotting-paper carbon, and some pieces of blotting-paper carbon made at two different
3424 times on the 17th, and carbonized in the same manner and same box as the first lot was carbonized.

Specimens of carbon produced by the witness*es* offered in evidence and marked "Welsh's Exhibit Horseshoe Carbons and Strips and Sheets, second lot."

15 Q. State, if you please, whether you have put any of these specimens of carbon in an electric circuit and passed the current through them.

Same objection.

A. I have.

16 Q. With what result?

Same objection.

A. I merely placed the carbons in a circuit with a Leclanche battery, to see whether I could get the current through them, and to determine the resistance of some of the specimens.

17 Q. What did you find the resistance or conductivity of the carbons to be?

Same objection.

A. The resistance was about sixty ohms of the pieces I tested, and the conductivity was good.

18 Q. Are the pieces you tested among the exhibits you have produced?

Same objection.

A. They are.

19 Q. Can you designate them from among the specimens?

Same objection.

A. One of them was one of the horseshoe loops and the others were some of the narrowest strips of lot two; I couldn't pick them out any better than that.

3425 20 Q. State whether or not you tested any of these carbons in an incandescent electric lamp.

Same objection.

A. I have not.

21 Q. Why did you not put some of them in the lamps and test them?

A. I would have done so, but I had no facility for doing so.

22 Q. Do you mean by your last answer that you have no lamps and no means of making and exhausting any?

Same objection.

A. I do.

23 Q. State whether, in your opinion, suitable carbons for incandescent electric lamps could be made of the specimens of carbon you have produced.

Same objection.

A. Very good carbons could be made from the specimens produced, and used as incandescent conductors in lamps.

Not waiving any objections heretofore made, counsel for Edison cross-examines as follows:

24 X Q. I wish you would describe a little further about this second lot of blotting-paper carbon, what the manipulation was previous to carbonization.

A. The papers were cut in shapes, the horseshoes being cut from blotting paper by means of a knife and chisel, and the other pieces were cut in squares and strips with a scissors. The paper was not compressed or in any way treated before being placed in the box.

25 X Q. Then I understand that each of these specimens of the second lot was made from a single thickness of blotting paper, is that so?

3426 A. It is.

26 X Q. When you put some of these carbons in an electric circuit, how long did they remain in the electric circuit?

A. To the best of my recollection, about two minutes.

27 X Q. How many of them did you put in an electric circuit altogether?

A. About three or four.

28 X Q. How did you determine the resistance?

A. By a galvanometer.

29 X Q. What was this resistance measured upon, the single loop or the strips of carbon?

A. To the best of my recollection, it was on the strips.

30 X Q. Have you preserved and produced all the specimens that were the result of your carbonization on the 14th and 17th of November?

A. I have.

31 X Q. Did you prepare these specimens with your best skill?

A. No, sir; I did not.

32 X Q. Why not?

A. Because they were only intended to illustrate the Sawyer method.

33 X Q. My question was not whether these were the best specimens you could have made in any way, but whether they were the best specimens you could make in the way you did, with your best skill?

A. With the facilities that I had, they were about as good as I could make them. I could have made the carbons more dense, stronger and straighter, with a different method of heating.

34 X Q. In making these carbons in the way you did, did you use the skill you had acquired while in the employment of the Edison Lamp Company?

Question objected to as immaterial, and for the further reason that the witness was directed to carbonize paper after the 3427 method described by Albon Man in his testimony in this case, as near as he could and as near as his facilities would permit. And that his testimony shows that he did so.

A. Yes.

35 X Q. Is the Exhibit First Iron Box in the same condition now that it was when you used it in the carbonization of the specimens you have produced to-day?

A. It was not in the same condition when I carbonized the first lot.

36 X Q. When did its condition become changed?

A. During the carbonization of the second lot.

37 X Q. What happened to it then?

A. The fire being very hot at the bottom, it setting at the same time on a wrought-iron stand, it melted and stuck together, and we were obliged to pull them apart.

38 X Q. In preparing this box for carbonization, did you lute the cover on with great care and with your best skill?

A. Yes, sir; I observed care in putting it on.

39 X Q. Is not such care and skill in this particular essential?

A. It is not.

40 X Q. Why then the need of any luting at all?

A. I put it on merely in case of accident to the box, such as tipping over, to hold the cover in its place and to keep the cover on.

Redirect by Mr. Broadnax:

41 R. D. Q. Was it necessary in making these specimens of carbon that the cover on the box should be luted at all, or that the box should be made air tight?

3428 A. Not necessarily, only sufficiently so to keep the charcoal in. When the box is left open the draught draws the charcoal out and exposes the contents to the air.

ALEX. WELSH.

Sworn to before me this 23rd day of November, 1882.

J. EDGAR BULL,
Notary Public, N. Y. Co., N. Y.

3429 Albon Man, a witness produced in behalf of himself and Sawyer, being duly sworn, in answer to interrogatories propounded by Mr. Broadnax, testified as follows:

1 Q. What is your name, age, residence, and occupation?

A. My name is Albon Man; am fifty-six years of age; I reside at 118 Putnam avenue, Brooklyn, New York; am a counsellor-at-law; my principal business is the management of trust estates; I have charge of large numbers of very large estates, known as the Lorillard estates, in the city of New York.

2 Q. State, if you please, whether you are the same Albon Man who has heretofore testified in this interference.

A. I am.

3 Q. Please state whether you are well acquainted with William E. Sawyer, and state, if you please, what has been Mr. Sawyer's relation to you since the fall of 1879, and towards the Electro-Dynamic Light Company, and the patents and inventions of Sawyer and Man owned by that company. Please confine your answer to the time embraced between the fall of 1879 and April, 1881.

A. I am well acquainted with Mr. Sawyer; Mr. Sawyer's attitude towards myself, personally, with rare exceptions, when he came to me for personal favors, has been one of hostility; not so much as to my individuality, but more particularly to the interest which I held and represented during that period. Towards the Electro-Dynamic Light Company, and the patents and inventions referred to, his attitude was continually hostile during that period.

4 Q. Please to state the facts and circumstances that brought about this hostility, and also the manifestations and acts of hostility of Mr. Sawyer pertaining to the patents and inventions in question.

A. I was a large stockholder of the Electro-Dynamic Light Company, and by my own stock and that of my friends, held the
3430 controlling interest in that company; I was vice president of
the company and was acting president most of the time, and I think, chairman of its executive committee. In the fall of 1879 Mr. Sawyer was anxious to obtain a license to use the patents and inventions belonging to the Electro-Dynamic Light Company; I met him at his office, I should say the last of November or first of December, at the corner of Courtlandt alley and Walker street, in the city of New York, in reference to that subject-matter; he, Mr. William E. Church and myself were the only persons present; he requested me to have the Electro-Dynamic Light Company give him the license which he desired, and offered to pay for it, if the company would give it, a royalty that should be satisfactory to the company; he specified the amount and terms, but I cannot now recollect the exact particulars regarding it; before then the matter had been presented to the executive committee and trustees of the company, and it had been decided that it was not advisable to grant such a license to Mr. Sawyer. I told him frankly that the company would not grant him such a license. He said I could do it if I wanted to; I said to him, Anyway, the company won't do it; he was very angry, and threatened that he would do all he could to injure the company and its patents and inventions unless he got the license; I told him he couldn't get it. From that time forward he was continually hostile to us; he resigned his position as secretary of the company and as a director, commenced the organization of a hostile company, exhibited the lamps and apparatus of the Electro-Dynamic Company as belonging to his new organization. He endeavored to get different people, who had been employed by the Electro-Dynamic Light Company, to take out patents for little things which had been used by the Electro-Dynamic Light Company, and to assign them to his new organization. He spoke belittingly of the patents and inventions of the company to different stockholders of
3431 the company and to others, endeavored to sell his stock
short at a price that was deemed altogether insufficient; he got hold of gentlemen that were proposing to put in large amounts of capital for the working of the patents of the Electro-Dynamic Light Company, and dissuaded or endeavored to dissuade them from doing so, and claimed generally that the patents and inventions held by his new organization and company would supercede and render valueless the patents and inventions of the Electro-Dynamic Light Company and told falsely, as I believed, and still

believe, to many persons that came to me with the stories, that he would break up and destroy the patents held by the Electro-Dynamic Light Company. He published articles and wrote a great many letters defamatory of the company, to person that brought them and showed them to me, and as he subsequently said to me in the spring of 1881, he had done all he could, or dared to do, to injure the company and its patents, and thought he had made a good fight of it; but that notwithstanding all he had been able to do he had not succeeded as he expected, and that he was then sorry that he had done it; he told me at that time that he had written and paid for articles to have them inserted in the newspapers with the object of injuring the company and its patents; had written books and published them with that object, and to glorify and render profitable his interest in the Eastern Electric Manufacturing Company; that he had succeeded to some extent—at any rate, he had prevented the Electro-Dynamic Light Company from making anything, and that I didn't know the half part of what he had done. I asked him if he considered his course an honorable one. He said, that wasn't the question. It had been a question of bread and butter to him, and that if he could have completely broken those patents of the Electro-Dynamic Light Company he would have done it. Yet he believed that it was all a mistake, and
that he would have done better to adhere to the old company
3432 (meaning the *the* Electro-Dynamic Light Company). That
at least there were honorable men connected with that, and complained that he had been fleeced and cheated by those connected with the Eastern Electric Manufacturing Company. I told him that I thought he had acted dishonorably in regard to the thing, especially toward myself; that he had injured himself beyond recovery by the manner in which he had conducted himself; that he knew that the inventions and patents of the Electro-Dynamic Light Company were honest and true, and that they were the foundation patents of electric lighting, and that he had destroyed himself in endeavoring to destroy them. He said, "Yes, I know it is so, and now that they are altogether held by one company, we can defy the world. I have not," said he, "injured these things so much as you think. I would, if I could, but now I am glad I didn't succeed. Of course," said he, "I couldn't do anything to aid the old company in supporting the patents in applying for reissues, or doing things as long as they were not helping me, and I was fighting them; but now I will do anything that I can, and sign any papers that are right." I said to him, "I do not see, Sawyer, how you can do much to aid in sustaining these patents now. We have compelled you to testify in the past, and we can compel you to do so again; but you have ruined your reputation and are a load to carry, and nothing I so much regret as that I ever mixed up my brains with yours in working out these inventions; the most you can do is to sign such application as may be necessary for reissues and things of that kind. If we need you as a witness, we shall call you if we can't avoid it. The greatest help you can be to us is to go and behave yourself, and be a man in the future." Mr. Sawyer replied: "I'll do so. I knew all

the time, down at the bottom, you have been my friend, and neither you, nor anybody connected with the old company (meaning the Electro-Dynamic Light Company), have never injured me as 3433 others have, and you have helped me notwithstanding all I have done, when nobody else would. Now I'll stop drinking, in fact, I have stopped, and you'll see I'll be a man, and you won't have occasion to be ashamed of me any more; I tried to prevent the trade between the two companies, but I couldn't succeed, and now I am glad of it, for I know there are men now connected with it who don't want to cheat everybody they have anything to do with." I said to Mr. Sawyer, " Don't make the mistake of supposing that you can ever recover the position that you have lost in the estimation of honorable men; you can never do it, but you be an honest man yourself and have the satisfaction of being so, and, if you behave yourself, you will realize in the end handsomely from your electric work, and from the inventions you and I worked out especially; and if you don't do it you will not prevent others from doing so, and injure yourself." He said, " Well, I guess I have had moral lecture enough for to-day. You'll see that I will do right." He bid me good day, and went off. This took place almost immediately after an agreement had been reached for the sale of the Electro-Dynamic Light Company patents and inventions to the Eastern Electric Manufacturing Company, and before the transfer had been made. The conversation took place in this room (No. 3 Mercer street—at my office); within a week afterwards—or at most ten days—he was apparently as hostile as ever, and berating me, and every one that I had anything to do with, to different people, as I was told. I called upon him and asked him to see Mr. Broadnax with reference to the execution of some papers. He treated me very coolly; said that he might do it, but he would do it when he got good and ready. From that time forward his attitude towards me, and towards the Eastern Electric Manufacturing Company, so far as I know, has been hostile. The above is the substance of the conversation which took place immediately after the agreement to transfer the patents to the Eastern Electric Manufacturing Company.

3434 NEW YORK, *November* 13, 1882.

Parties met pursuant to adjournment.
Present: Same parties.

5 Q. You say, in answer to question 6, that Mr. Sawyer told you that he had written and paid for articles to have them inserted in the newspapers, with the object of injuring the company and its patents; had written books and published them with that object, and to glorify and render profitable his interest in the Eastern Electric Manufacturing Company; please to state whether or not, at the time Mr. Sawyer made such statement, he admitted to you that the statements contained in said newspaper articles and said books were untrue, and were written and published by him for the purpose of injuring the patents and inventions of the Electro-Dy-

namic Electric Light Company. Please state fully what Mr. Sawyer said on that subject, if anything?

Objected to as leading.

A. I taxed Mr. Sawyer with making untruthful statements; that these things which he had written and published were not true, and that he knew it at the time. He said, "Of course I knew that well enough; but you would not expect me to say anything in favor of those patents when I am fighting them, and I know as well as you do that they were good, but I can do with truth say anything against them, and I could not away with anything I have said against them; and you will find, if you look at it carefully, and what I have written and published as statements against them I am in no case direct and positive, for I have avoided making positive statements, and what I have said and done against them is rather by implication than anything else, sometimes by omitting to say something, and sometimes by saying something about the patents
3435 and inventions of others, especially Mr. Edison, and bringing in at the same time some omission or partial statement in regard to the Sawyer and Man invention injurious to them. You'll find I have said nothing positive." I said: "That may be so, Mr. Sawyer. I don't want to study it. It seems to me you have gone just as far as you dared to, endeavoring at the same time to avoid criminal liability; I do not think anything you can say or do will be of advantage to us; no man can descend to the depths you have, and be able afterwards to throw discredit on his deviltry."

6 Q. State what, if anything, Mr. Sawyer said to you respecting the joint inventorship of the inventions for which the joint patents were granted to Sawyer and Man.

A. At the time to which I have referred, and in the conversation, I referred to the subject-matter of the joint inventions, for which patents were taken out in the name of Sawyer and Man, and told him that I had heard that he denied that they were joint inventions, to other people; I said, "You have never done so to me, or pretended to any such thing, and I don't believe you would dare to; but your course in regard to them, so far as I am concerned, appears to me to be simply infamous; you in substance declare not only me, but yourself, to be perjurers." He said: "Well, I have been driven by my necessity to a great many things that I ought not to have done, and which I am ashamed of; I have tried to make people believe that they were not joint inventions, but I did not in any case positively state so; of course joint inventions are easier attacked than any other, and I was going for all the weak points." At a great many times prior to this, from and after the spring of 1879, I was told by different people that Mr. Sawyer claimed that the inventions for which patents were taken out in the name of Sawyer and Man, were not truthfully joint inventions, and that he claimed them as his own invention. I many times taxed him with making such statements, and he
3436 positively denied to me as often as I spoke to him on the

subject, that such was the fact. He frequently said to me, "I am not damned fool enough to do such a thing as that; but you must not expect me to aid you in sustaining these thing which I have helped to get up myself, which you won't allow me to have any use of at all."

7 Q. Please to examine the book I now show you, and which is marked Edison's Exhibit Sawyer's Book, in this case, and state if you know who wrote and published it.

A. I think Mr. William E. Sawyer wrote and published it, or caused it to be published. He told me in the winter of 1881, that he was writing such a book, and in the latter part of the winter or the early spring, I received a copy of it, enclosed, I think, by him, through the mail, or by messenger. It may have been his father, instead of him who sent the book to me. I think Mr. William H. Church was the messenger, if I mistake not.

8 Q. I call your attention to the following statement contained in said book on page 72: "The carbonizing of live willow twigs with a view to obtaining a suitable bent carbon by Sawyer and Man, and the carbonizing of paper and bamboo by Edison, substantially closes the account of incandescent carbons." Please state whether that statement, in so far as it implies that Mr. Edison carbonized paper and bamboo for use in electric lighting in incandescent electric lamps before paper was carbonized by yourself and Mr. Sawyer, and successfully used in incandescent electric lamps, is true.

A. I cannot know of my own knowledge at what time, if ever, Mr. Edison carbonized paper for the purpose of using it in incandescent lamps. If Mr. Edison did not do so prior to the spring of 1878, when we did so, any implication that Edison was the prior and first person to make and use paper carbons for incandes-
3437 cent electric lamps, which might arise from this statement,
is false. I consider the statement as one of those referred to by Mr. Sawyer in his conversation with me, containing a pregnant omission intended by him to damage and injure the patents of the Electro-Dynamic Light Company. The omission to which I refer is an omission to state the carbonizing of paper for use in incandescent lamps by Mr. Sawyer and myself, while at the same time mentioning the carbonizing of paper by Edison, as though he was the sole person who did it.

10 Q. I read to you the following statement found in the same book on page 78: "The filament originally used by Mr. Edison was prepared by cutting card-board in the desired shape and carbonizing the same by placing the loops thus formed in layers within an iron box with intervening layers of tissue paper, closing the box to exclude oxygen, and raising the whole to red heat in the furnace." What have you to say in answer to the implication that appears upon the face of that statement?

A. My answer is the same as my reply to the last question, with the addition or explanation that Mr. Sawyer omits to state that we cut paper into forms for carbonizing, carbonized them afterwards, and used them successfully in incandescent electric lamps, and this, as I understand it, before Mr. Edison did any such thing. At any rate we did it in the spring of 1878, in substantially the method stated in the book, as I before testified in this case.

11 Q. I read to you the following statement contained in said book, on page 86: "The Sawyer and Man experiments were of an extensive and deversified character, and among the earliest attempts to obtain a practical lamp, was the including of an arc or loop of carbon in the circuit of the radiator (Fig. 52). This carbon loop was originally employed in March, 1878, a rod of retort carbon being turned true in a lathe and bored out to form a tube; from this their flanges were cut; and after being clamped 3438 between carbon washers, the upper part was left standing, and the lower part broken out. It was not until the following winter that the carbonizing of different substances in the form of a loop and especially twigs of live willow was attempted with varying results; a year later Mr. Edison greatly improved the manufacture of these loops by processes much better calculated to attain the end desired than those employed by Sawyer and Man, whose success in this direction was limited." Please to state whether that statement contains the whole truth, as you know it, and what of falsehood it contains by implication, if any.

A. The statement does not contain the whole truth, by reason of omiting the statement that paper washers cut out in the form of a flat circular ring, were carbonized and used in incandescent lamps successfully by us prior to, or about the same time, as the turning out of the retort carbon, referred to in that statement; I characterize this omission as one of the same character as those in my last two answers; the statement that the carbonizing of different substances by Mr. Sawyer and myself did not take place until the following winter, is not true; it took place for the most part, in the winter and spring of 1878, including horn, paper, sugar, glues, several different kinds of wood, and other things; I cannot, at this moment, recollect what, but a variety of things; some of them we attempted to use by combination of the carbon after formed, and some by direct use of the carbon in the form of the substances before carbonization: I do not think that any of these experiments were as late as the winter following, though some may have been in the early part of December, 1878; if so, they were renewals of previous experiments.

12 Q. I call your attention to an article published by Mr. Sawyer in the New York Herald of December 24, 1879, said article being entitled, "Sawyer on Edison and the Herald," and is dated 3439 New York, December 23, 1879, and addressed to the editor of the Herald, and I read to you from said articles the following statements:

"If you care to settle the question of priority of invention upon the horseshoe lamp between Mr. Edison and myself, you may inspect one of those lamps which broke down at 94 Walker street about one year ago, and after many experiments, was so far condemned that Mr. Man and I concluded we would not waste enough money on it to pay for a patent. This lamp is at present just exactly as it was removed from the bracket, hermetically sealed in a glass globe filled with nitrogen gas, and in just exactly the same condition it was a year ago. To avoid any question, I placed said abandoned institution in the hands of Messrs. Arnoux & Hochhausen, No. 2 Howard street, yesterday, Monday morning, at nine o'clock." What answer, if any, have you to make to that statement?

A. That it is not true, so far as I am concerned, and I do not think it was true with Mr. Sawyer, that he and I ever concluded that "we would not waste money enough on it to pay for a patent." I never came to any such conclusion at any time, nor in any way. Neither did I ever abandon, or intend to abandon, the arc form of carbon, or the lamp in question, which I know, and I deny the right of Mr. Sawyer to allow Mr. Edison, "The Wizard," or anybody else, to patent it. I knew nothing of the putting of the lamp in the hands of Arnoux & Hochhausen. It was not put in their hands by my consent. It belonged to the Electro-Dynamic Light Company; and as soon as I found that it had gone into the hands — any one else, I endeavored to get hold of it, and eventually succeeded in getting it and putting it in as an exhibit in this case. I gave Messrs. Arnoux & Hochhausen orders, when I found it was in their possession, not to give it to any one, and especially not to let it go back to Mr. Sawyer.

3440 13 Q. Please to read the whole of the article from which I quoted, and to which you referred in your last answer, and state if you find one word in it about the use of carbonized paper as the illuminating conductor in incandescent electric lighting?

A. I do not see anything of the kind in the article.

14 Q. I call your attention to an article in the New York Herald of January 5, 1882, said article being entitled, "A challenge to Edison," dated January 4th, 1880, and addressed to the editor of the Herald, and signed W. E. Sawyer; please read the whole of said article, and state whether you can find anything in it bearing upon the subject-matter of this interference, and make any answer to said article you may desire.

A. I have read said article; I see no reference in it to the subject-matter of this interference so far as paper carbon is concerned; I see no further answer to make to it.

15 Q. I call your attention also to an article in the New York Herald of January 6, 1880, entitled, Mr. Sawyer's exhibitorium; which article is dated January 5, 1880, addressed to the editor of the Herald, and signed W. E. Sawyer; please to read the whole of that article, and state if you find anything in its bearing upon this interference, and make any further answer to the article as you desire?

A. I have read the article referred to; I see no reference whatever in this article to the subject-matter in this case, unless it be the statement that he had been working simply and solely with a view to a genuine scientific success, in reference to which I hereby remark that his methods for such a purpose or with such a view, were extremely peculiar, and it seems to me, utterly inconsistent with the statement.

16 Q. State if you recollect going to Mr. Sawyer, upon my request, within a short time after the declaration of interference in this case, and asking him to execute the papers necessary to divide this application, so that we could go on and prosecute the claims 3441 not in interference, and, if yea, please state with what result you made such application to Mr. Sawyer, and what he said to you at the time, as far as you can remember the conversation?

A. I recollect calling upon Mr. Sawyer for the purpose very shortly after the declaration of interference in this case, at your request, and asking him and urging him that he should execute the necessary papers which he then had in his possession; he declined to do so, and said he would do nothing to help the Electro-Dynamic Light Company; I reminded him that he was a large stockholder in the Electro-Dynamic Light Company, and urged his personal interest in the matter; he replied that he appeared of record to be a stockholder there, but that he had parted with all his interest, as I understood, to the Eastern Electric Manufacturing Company, or those who were aiding him in supporting it; that he would be a fool to aid in getting out patents which might be in the way of that company; but after all when I urged him still further, on the ground of honesty and right, and his personal obligations to me, he said in substance that if they (the Eastern Electric Manufacturing Company) didn't do what he wanted them to he might be in a position to do it; he'd see. I asked him for the papers and he refused to give them to me; I called on him once or twice afterwards within a day or two, and urged him in a similar manner with a similar result.

17 Q. State if you recollect going to Mr. Sawyer upon my request, with the necessary papers to apply for a reissue of the patent granted to Sawyer and Man for an electric light system, said patent being numbered 205,303, and dated June 25, 1878, and of requesting Mr. Sawyer to execute said papers; and state what the result of your application to Mr. Sawyer was for such execution, and what Mr. Sawyer said to you, as you can recollect, upon that occasion.

A. I went to Mr. Sawyer at your request a number of times to get him to sign an application to reissue the patent to which you refer; he uniformly declined to do so, and gave reasons 3442 for it similar to those I have mentioned in my last answer; his attitude toward me and toward the Electro-Dynamic Light Company in reference to these matters upon these occasions when I called upon him was uniformly hostile, and I remember his telling me, in substance, that he would rather hurt us than help us. He did finally execute the papers, after an agreement had been reached to sell the patents and inventions of the Electro-Dynamic Light Company to the Eastern Electric Manufacturing Company, at or about the same time the agreement was carried out.

Counsel for Sawyer and Man offer in evidence certified copies of the following papers, to wit:

Memorandum of an agreement between William E. Sawyer and Albon Man, dated March 19, 1878, recorded April 4, 1882.

Also, agreement between William E. Sawyer and Albon Man, dated May 11, 1878; recorded April 4, 1882.

Also, general release by William E. Sawyer, dated May 21, 1879, and recorded April 4, 1882.

Also, an assignment from Albon Man to the Electro-Dynamic Light Company, July 15, 1878; recorded April 4, 1882.

Also, assignment of William E. Sawyer to Albon Man, dated May 14, 1878, and recorded May 16, 1878.

Also, three assignments of Sawyer and Man to the Electro-Dynamic Light Company, both dated July 15, 1878, and recorded May 29, 1879.

3443 Assignment of William E. Sawyer to Electro-Dynamic Light Company, dated October 16, 1878, recorded October 22, 1878.

Also, assignment of Sawyer and Man to Electro-Dynamic Light Company, dated November 6, 1878, recorded November 12, 1878.

Also, assignment of Sawyer and Man to Electro-Dynamic Light Company, dated October 14, 1878, recorded October 22, 1878.

Also, assignment of Sawyer and Man to Electro-Dynamic Light Company, dated February 3, 1879, recorded May 29, 1879.

Also, assignment of W. E. Sawyer to the Electro-Dynamic Light Company, dated December 9, 1878, and recorded March 14, 1879.

Also, assignment of Sawyer and Man to Electro-Dynamic Light Company, dated December 9, 1878, recorded March 14, 1879.

Also, assignment of Wm. E. Sawyer to Electro-Dynamic Light Company, dated June 28, 1879, and recorded Q. 24, p. 10.

Also, assignment of Sawyer and Man to Electro-Dynamic Light Company, dated Jan. 8, 1880, recorded W. 24, p. 380, Jan. 9, 1880.

Also, assignment of Wm. Sawyer to Electro-Dynamic Light Company, dated July 30, 1879, recorded September 2, 1879.

18 Q. I place in your hand the original of the above assignments; please to examine them and state whether or not they were all duly executed?

3444 A. They were, by myself and Mr. Sawyer where they were joint assignments, by myself where they were my own assignments solely, and by William E. Sawyer where they were his assignments solely.

Counsel for Sawyer and Man gives notice that the foregoing assignments, agreements, leases, etc., are put in evidence for the purpose of proving that before the patent was applied for, making the subject-matter of this interference, and before the writing and publication of any of these letters by William E. Sawyer, put in evidence on behalf of Edison, and before the writing or publishing said book, Edison Exhibit Sawyer Book, the invention making the subject-matter of this interference had been fully assigned to the Electro-Dynamic Light Company, and held and owned by it; and for the further purpose of showing that said invention had not been abandoned by Sawyer and Man, or by the owners of said invention.

Counsel for Edison objects to the above assignments for the purpose of proving the fact above referred to, but makes no objection to the proof of the execution of the instruments or their genuineness.

19 Q. State, if you know, whether at the time of the writing of the book, Edison Exhibit Sawyer Book, and the articles in the Herald, to which your attention has been called, and about which you have testified, the invention making the subject-matter of this interference was in fact owned and held by the Electro-Dynamic Light Company.

A. It was so owned and held, and the counsel for the company had prior thereto been instructed to prepare applications for letters
patent for the same. The invention making the subject-
3445 matter of this interference was formally transferred, or in-
tended so to be, by an assignment dated October 16, 1878, to the Electro-Dynamic Light Company, and the formal assignment of this invention by Mr. Sawyer and myself, dated January 8, 1880, was intended more particularly to authorize the Commissioner of Patents to issue the patent for the same to the Electro-Dynamic Light Company as assignee.

20 Q. What was the memorandum of agreement referred to in the agreement between Mr. Sawyer and yourself, dated March 19, 1878?

A. The memorandum of agreement referred to in the memorandum of agreement between William E. Sawyer and myself dated March 19, 1878, and recorded April 4, 1882, in Liber A 28, page 117 of Transfers of Patents, was made in a small memorandum book signed by Mr. Sawyer first on February 15, 1878, and was in words and figures following: "Advances to William E. Sawyer on account of experiments in electric lighting made by Albon Man, and not to exceed in amount $250, and to be returned by Sawyer within fifteen months from date in case Man is not satisfied to go on after seeing result of preliminary experiments, for which these advances are made. Dated February 15, 1878. Signed, W. E. Sawyer." Then followed a list of payments made to Mr. Sawyer; there was made at the same time, or before, a memorandum of agreement, signed by Mr. Sawyer that all inventions upon electrical subjects which had been made by him, or which should be made by him, should belong to him and me jointly in the proportion of $\frac{55}{100}$ to me and $\frac{45}{100}$ to him, except certain things which he had, or claimed to have invented for electric motors, and something in regard to telegraph, I can't now distinctly recollect what, that paper has been mislaid; it was, however, superseded by the papers which have been put in evidence, and we proceeded upon a different basis from that at first con-
templated, only so far as that finding the inventions referred to
3446 in the agreement of February 15, 1878, which had already
been made and contemplated by Mr. Sawyer, not immediately applicable to the production of a practical light, I went to work out, and did work out with him, new and joint inventions, which resulted in the production of a practical light. The invention making the subject-matter of this controversy being one of the joint inventions, but our understanding and agreement in other respects

as to the interest of each party in the inventions and patents to be taken therefor, including any joint inventions of Mr. Sawyer and myself, as well as his sole inventions, was that they should belong to us in the proportions stated in the first agreement remained the same, and the disposition that should be made of the patents, to wit: that they should be assigned to a company to be formed remained the same as specified in the agreement between Mr. Sawyer and myself, dated March 19, 1878. Up to this time we had not realized that the work we were doing was the production of joint inventions, but as soon as we began to consider the question of taking out patents, this subject was brought to our attention, and we realized the fact that the inventions were joint and not the separate inventions of Mr. Sawyer. The Electro-Dynamic Light Company was formed to take, and did take the assignment of the inventions and patents, in pursuance of the agreements and assignments between Mr. Sawyer and me. The agreement of May 11, 1882, was made to put on record or perpetuate the evidence of the fact of these inventions having been the joint inventions of Sawyer and Man, and not the individual inventions of Sawyer (and are in the handwriting of Mr. Sawyer), and to modify and conform the previous agreement and understandings to the facts as they existed, and for other purposes.

21 Q. State, if you please, whether or not Mr. Sawyer had any interest in the invention making the subject-matter of this interference at the time he wrote and published Edison Exhibit 3447 Sawyer Book, and the articles in the New York Herald, to which I have called your attention, other than as a stockholder in the Electro-Dynamic Light Company, or the Eastern Electric Manufacturing Company.

A. I do not understand that he had any interest whatever in it other than adverse interest, either as stockholder or otherwise. He was nominally a stockholder of the Electro-Dynamic Light Company, but had parted with his interest, or had so used it to place it in antagonism to these patents, and his interest as stockholder in the Eastern Electric Manufacturing Company was adverse to these patents and inventions, and rendered him hostile thereto.

Question and answer objected to, as the assignments themselves are the best evidence of the interest of William E. Sawyer to the inventions or applications named.

22 Q. Please state, if you know, whether or not the invention making the subject-matter of this interference, together with all the patents and inventions made by yourself and Mr. Sawyer, jointly or severally, and owned by the Electro-Dynamic Light Company, were all duly transferred and conveyed to the Eastern Electric Manufacturing Company, on or about April 6, 1881.

A. They were so conveyed and transferred; I, as an officer of the Electro-Dynamic Light Company, taking part in such transfers at the time; the transfer was made with the written consent and approval of all the stockholders of the Electro-Dynamic Light Company; said transfer having been made to William H. Church, as trustee, and by him on the same day, to the Eastern Electric Manufacturing Company, as evidenced by the assignments dated on or about that time and recorded on the fifth day of October, 1882, in Liber J. 28, pp. 429 and 433, of Transfers of Patents.

Same objection to this question and answer as to the 21st question and answer.

3448 Counsel for Sawyer and Man gives notice to counsel for Edison, that if necessary upon the hearing of this cause, he will make use of said records to prove the ownership of said patents and inventions.

23 Q. State, if you know, whether or not these same inventions and letters patents have been transferred to the trustees of the Consolidated Electric Light Company from the Eastern Electric Manufacturing Company. and are now owned by that company.

A. They have been so transferred, and are now held and owned by that company. I was present as one of the Consolidated Electric Light Company, at the time the transfer was made, and saw the assignment executed and delivered, and which assignment is dated thirtieth day of September, 1882, and recorded in Liber J. 28, p. 441, of Transfer- of Patents in the Patent Office.

Same objection repeated to the question and answer.

Counsel for Sawyer and Man gives notice that, on the hearing of this cause, he will use the record referred to to prove the present ownership of said patents and inventions, in case he should deem the same necessary.

24 Q. State whether or not you and Mr. Sawyer are now, and have always been, merely nominal parties to this interference?

A. We are, and always have been, only nominal parties in interest, the invention constituting the subject-matter of this interference was, at the time of this application for the patent, and had always been from its origination, the property of the Electro-Dynamic Light Company, and so remained until the transfer to the Eastern Electric Manufacturing Company; from which time, and until the transfer to the Consolidated Electric Light Company,
3449 it belonged to, and was the property of the Eastern Electric Manufacturing Company, and from the time of the last-named transfer, it has been, and now is, the property of the Consolidated Electric Light Company; I have no interest in the invention other than as a stockholder of the last-named company.

Same objection as before.

25 Q. State, if you know, why the Electro-Dynamic Light Company refused to go on with Mr. Sawyer early in the year 1880, and to have anything further to do with him toward the development and practical introduction of the patents and inventions owned by them, and why they refused to give him the license about which you have testified.

A. By reason of Mr. Sawyer's inebriate habits which had rapidly grown upon him from the time of the organization of the company, and because they deemed it unwise and inexpedient to endeavor to bring out these patents, and put them in practical operation under the management of Mr. Sawyer; his habits, in the judgment of the officers of that company, rendering him an unfit and improper person to have charge of such important interests; and the same reasons influenced them in refusing to grant him a license, together with other reasons.

Adjourned until 10 o'clock, 22d November, 1882.

3450 NEW YORK, *Nov. 22d*, 1882—10 o'clock a. m.

Parties met pursuant to adjournment.

Present: Counsel as before.

Counsel for Edison gives notice that he does not waive any objection to the foregoing testimony of Albon Man as inadmissible, for the reason that it is not in accordance with the decision of the Commissioner of Patents in reopening this interference.

26 X Q. What was the date of your first acquaintance and business relations with Mr. William E. Sawyer?

A. I believe I have gone all through with that.

27 X Q. What were your personal relations with him between that date and the fall of 1879?

A. I believe that our relations were personally friendly up to that time. There may have been intervals of time when Mr. Sawyer was hostile to me, I do not recollect. I had refused to furnish money to him as superintendent to conduct the business of the Dynamo-Electric Light Company. He had been angry about it at different times, but in his sober moments admitted that I was right about it and professed a friendly regard for me.

28 X Q. How long was Mr. Sawyer superintendent of the Electro-Dynamic Light *Cam*pany?

A. Up to—I should say—some time in the month of March, 1879, or about that time. Mr. Sawyer was in charge of the work that was being done by the company for the most part. I do not know that there was any office of superintendent. He and I both gave directions in regard to the work, but he was there most of the time. In my former answer in calling him superintendent I referred to his being at the shop most of the time, and while there alone superintended the work.

3451 29 X Q. After Mr. Sawyer ceased his superintendence or supervision of the work about March, 1879, who performed those duties up to the fall of 1879?

A. The work was transferred to Wallace & Sons' shops at Ansonia, Connecticut, and Mr. Edwin M. Myers, as I understood, was the acting superintendent under them, although Mr. Sawyer had agreed with them to give his time and attention to the business as I understood it, but neglected to do so, at least for the most part or to such an extent that it was not satisfactory to Messrs. Wallace. Messrs. Wallace & Sons had a contract with the company for doing the work and putting the patents and inventions in operation. This contract was with the Electro-Dynamic Light Company. That contract was afterwards rescinded by mutual agreement.

30 X Q. Did Mr. Sawyer give his assent to the making of that contract?

A. He did.

31 X Q. Was there any difficulty between Mr. Sawyer and yourselves or the Electro-Dynamic Light Company, between March, 1879, and the fall of 1879?

A. Yes, sir; I think there was between Mr. Sawyer and myself.

32 X Q. Please to fix, as nearly as you can, the date in the fall of 1879, when the hostilities of Mr. Sawyer commenced, which continued till April, 1880.

A. In the early part of the fall of 1879, I should say early in the month of September, his hostility to me took active shape. I was afterwards made fully aware of it at the time Mr. Church and I were at his place in Walker street, at the time before referred to. Mr. Sawyer was at Ansonia during the summer of 1879, and after his return in the fall was at me to give him license, as I have testified. This was brought to a positive conclusion at the time of the interview in November or December, when Mr. Church was present, corner of Courtlandt alley and Walker street; but, as I subsequently learned, he had been all the fall endeavoring to 3452 make arrangements hostile to the Electro-Dynamic Light Company.

33 X Q. Who did you learn that from?

A. From his father, from his brother, from two or three gentlemen, one of them a Mr. Goddard, who told me that Mr. Sawyer had approached him upon the subject of getting up a hostile company, and from others, who told me, I cannot recollect who they were, I think Mr. Church was one; I don't know where Mr. Goddard is, or what his business is; he was a club acquaintance of mine in Brooklyn; at the Lincoln club.

34 X Q. When Mr. William E. Sawyer and Mr. Church and yourself were together at the office, at the corner of Courtlandt alley and Walker street, when Mr. Sawyer demanded the license, upon what ground did he ask it?

A. I do not know that he specified any ground, only that he wanted it. He wanted to use it in connection with other inventions that he had in mind, or had made, or something of that kind, principally, I think, a submarine lamp, but I cannot be certain, but not confined to that, he wanted a general license.

35 X Q. Did you offer to give him a limited license?

A. No, sir; wouldn't give him any kind of license.

36 X Q. Did Sawyer say that he wanted a licence in order that he might manufacture his submarine light?

A. I should think so, or in substance that, but not confined to that; he seemed to talk and feel as though because he was one of the inventors, he ought to have the right to use the invention as he pleased, although he had sold and assigned them to the Electro-Dynamic Light Company, or united in doing so.

37 X Q. Did he at that interview speak of any other thing which he wished to manufacture beside the submarine light?

A. Yes, sir; he wished to manufacture all the things for which the company then held patents; but the submarine light was, I
think, the then present thing which he wished to make, and
3453 in connection with which he wished to use the patents be-
longing to the Electro-Dynamic Light Company.

38 X Q. Did he complain that the company were not manufacturing?

A. I think he did, and I explained to him the reason why; that he had failed to render the assistance which he had promised and agreed to render at the shops of Messrs. Wallace, in Ansonia, and had conducted himself in such a manner that Messrs. Wallace would not have him in their shops now, and that Mr. Edwin M. Meyers, who had been in charge at Ansonia, and was the man best fitted and knew the most about the work to be done, was sick, and that neither Messrs. Wallace nor the Electro-Dynamic Light Company wanted to put another man in charge, and intended to wait until Mr. Meyers was able to go on with the work; I told him that it was his own fault and nobody's else, that the work was not going on; he admitted the fact, but insisted that he should be allowed to go on as he pleased under a license.

39 X Q. Did Mr. Sawyer appear to be much disappointed at the refusal of the license?

A. He appeared angry, and made threats as I have stated.

40 X Q. Did he make threats before the refusal of the license?

A. My recollection is that, at this interview his request or demand for a license was accompanied by a threat as to what he would do if the license shouldn't be granted to him, and the threats were repeated after I told him that he could not get a license.

41 X Q. You say, in answer to the fourth question, that Mr. Sawyer "exhibited the lamps and apparatus of the Electro-Dynamic Company, as belonging to his new organization;" when and where did he make such exhibition?

A. I cannot remember the number of the street; my impression
is Fifty-fourth street and Eighth avenue or its vicinity; and
3454 also again at a place in Fulton street near Gold, in the winter
and spring of 1880; I saw the exhibition in part myself at
both these places.

42 X Q. In the same answer you say that Sawyer endeavored to get different people who had been employed by the Electro-Dynamic Light Company to take out patents for little things which had been used by the Electro-Dynamic Light Company, and to assign them to his new organization;" please give the names of the different people referred to in the above answer?

A. His father, William Sawyer, a Mr. Stillman, a Mr. Knowles, a Mr. Sharpe, now of Ansonia, Connecticut, Mr. Edwin M. Myers, of Plattsburgh, as I was informed and believe; I was so informed by Mr. Sawyer's father by Mr. Sharpe and Mr. Meyers; Mr. Meyers showed me a letter at one time from Mr. Sawyer upon this subject.

43 X Q. In the same answer you say that William E. Sawyer "spoke belittlingly of the patents and inventions of the company to different stockholders of that company and to others;" please gives the names of these people, so far as you can remember.

A. Among the stockholders were Mr. C. C. Allen, Mr. Horace Little, Mr. Jacob Hays, Mr. Lawrence Meyers, and Mr. Broadnax, among other people; I can't recollect names, but a great many people came to me and told me that Sawyer told them that the patents were of small consequence.

44 X Q. In the same answer you say that Sawyer "got hold of gentlemen who were proposing to put in large amounts of capital for the working of the patents of the Electro-Dynamic Light Company, and dissuaded, or endeavored to dissuade them from doing so," please give the names of those gentlemen?

A. I do not know them and never did; upon two occasions gentlemen came to me stating that certain parties, in one instance from Boston, and in another instance from Chicago, were in the city of New York making investigations with regard to electric lighting and the making of investments
3455 therein; that they had examined the patents of the Electro-Dynamic Light Company, and if reasonable and favorable terms could be obtained, would put all the money that was required into the working and development of these patents. They were favorable impressed with them and were ready, if suitable terms could be obtained, to go on at once; the directors of the company were called together in one case, and made terms or proposal for interesting the parties which, we were told would be satisfactory; soon afterwards the negotiator informed us that Mr. Sawyer had got hold of these parties, and dissuaded them from doing anything; the other case was somewhat similar, except that I do not think that any formal meeting of the directors of the company was held in regard to it, but the executive committee of the company told the negotiator that the terms which had been obtained in the first case could be obtained in the second; in a short time we were told that Mr. Sawyer had interfered again, and that the thing was at an end; I cannot be certain in regard to the second parties where I was told they were from; it may have been Chicago or St. Louis, but at any rate it was from some western place; Mr. Charles A. Cheever was the negotiator referred to in the above answer. There was another party from Cincinnati; I cannot give his name, for I have forgotten it, who came to me with Mr. Goddard, to whom I have before referred, but whose first name I cannot give; he professed to desire to want to put in money in the working of the patents of the Electro-Dynamic Light Company, especially in Cincinnati; Mr. Goddard told me after a little that Mr. Sawyer had got hold of him, and he had concluded not to do anything at present; there were ever so many cases of a similar character, but I cannot recollect the parties.

45 — Q. In the same fourth answer you say that Sawyer "published articles, and wrote a great many letters defamatory of
3456 the company to persons who brought them and showed them

to me," "had written books and published them, had written and paid for articles to have them described in the newspapers;" please state more in detail about these published books, articles, newspaper articles, and about the letters mentioned in the above question.

A. Mr. Jacob Hays, Mr. C. C. Allen, Mr. Broadnax and others showed me such letters from Mr. Sawyer, and, if I am not mistaken, Mr. Meyers; Mr. Lowery, counsel of the Edison Company, told me in substance, that if they could believe what Mr. Sawyer had written to them, and offered to swear to, that the patents of the Electro-Dynamic Light Company were of little or no value; different people, I don't know who, the clerks in my own office among them, showed me articles of this character, or called my attention to them at different times; some of them I read, and some of them I did not read; my friends said to me, you must be a great rascal, if what Mr. Sawyer is saying about your patents in the newspapers is true; Mr. Sawyer himself told me that he had written articles and published them in the newspapers, and paid for their insertion, that he had written those articles and published books to injure the company and its patents; some of these articles and books have, I believe, been introduced in evidence in this case. The newspaper articles have been too numerous for me to specify, and I have kept no file of them, and know more of their character by what has been told to me by others, including Mr. Sawyer, than from reading them; in fact, I have usually abstained from reading them.

46 X Q. Referring to the answer to your 20th Q. in respect to a memorandum of agreement made on or about February 15th, 1878, between yourself and Mr. Sawyer with regard to the ownership of inventions made by him, was that agreement recorded?

A. It was not, to my knowledge; I have made search for the paper and have been unable to find it, and have no copy of it.

3457 47 X Q. What are the other reasons referred to at the close of your answer to the 20th Q.?

A. One of the other reasons was that the company had a then subsisting agreement with other parties for the exclusive manufacture of its patented articles, another, that it would introduce confusion in the management of the affairs of the company, and there were other reasons, probably, as I know a great many objections were raised to granting such a license, at the meeting of the executive committee of the company at which the subject-matter was discussed prior to the refusal to Mr. Sawyer to grant him a license; I cannot now recollect to specify what these reasons were.

ALBON MAN.

Sworn to before me this 22d day of November, 1882.

J. EDGAR BULL,
Notary Public.

Adjourned until November 23d, 1882, at 10 a. m.

3458 William H. Church, a witness produced on behalf of Sawyer and Man being called and duly sworn, in answer to interrogatories propounded by Amos Broadnax testified as follows:

1 Q. What is your name, age, residence and occupation?

A. William H. Church; am fifty years old; reside at 89 Henry street, Brooklyn, N. Y.; am connected with electric lighting, and experiments therein.

2 Q. State whether you are the same William H. Church who has heretofore given testimony in this case?

A. I am.

3 Q. And are you well acquainted with William E. Sawyer and Albon Man?

A. I am.

4 Q. Please look at the book I now show you marked "Edison Exhibit Sawyer Book," and state if you recollect ever having seen it before? I do not mean this identical copy, but I mean a book published by William E. Sawyer, of which this is one of the copies.

A. I do recollect having seen a copy of this same book.

5 Q. State where you first saw it and who showed it to you?

A. I first saw it about the month of May, 1881, at the shop of the Eastern Electric Manufacturing Company; I think it was 97 Fulton street, New York; Mr. William E. Sawyer showed me several copies of the book.

6 Q. Please state what, if anything, Mr. Sawyer said appertaining to the book at the time he showed it to you.

Objected to as incompetent, and as being in the nature of hearsay testimony.

A. He said that this book contained many good things on the subject of electric lighting, and some that were not so good, 3459 in fact, were not true; that the book was written at the time that his feelings were antagonistic to the interest of the Sawyer-Man patents, and he regretted some things that he had expressed; he offered me a copy of the book, which I declined to accept, saying that I did not care for anything that was not considered entirely true; he said: "You know how I am Church; when my passions are aroused I say and do many things which I afterwards regret;" I have never read the book, or taken any interest in it.

7 Q. State whether or not at the time Mr. Sawyer offered you this book, Mr. Sawyer's interest had been harmonized with the Sawyer-Man patents.

A. It had.

8 Q. Please to state, if you know, what facts and circumstances had occurred to harmonize Mr. Sawyer's interest with the Sawyer-Man patents at the time or before Mr. Sawyer showed you this book, and made the statement you have related.

A. In the month of April, 1881, the Sawyer-Man patents were sold to the Eastern Electric Manufacturing Company by the Electro-Dynamic Light Company.

9 Q. Was Mr. Sawyer connected with the Eastern Electric Manufacturing Company, and was that company antagonistic to the Electro-Dynamic Light Company?

A. Mr. Sawyer was connected with the Eastern Electric Manufacturing Company, and it was organized by Mr. Sawyer to be antagonistic to the interests of the Electro-Dynamic Light Company.

10 Q. Was the Electro-Dynamo Light Company the owner of what is known as the Sawyer-Man patents?

—. ——.

11 Q. State, if you know, what was Mr. Sawyer's attitude toward that company and towards the patents and inventions owned by that company, previous to the time that the Sawyer-Man patents and inventions were sold to the Eastern Electric Manufacturing Company.

3460 A. It was unfriendly.

12 Q. State, if you know, why his attitude was unfriendly.

A. Previous to organizing the Eastern Company, Mr. Sawyer demanded a license from the Electro-Dynamic Light Company to manufacture lamps and operate the system of electric lighting as set forth in the Sawyer-Man patents, which was refused. Whereupon Mr. Sawyer declared to me that he would do everything in his power to break down those patents.

Objected to as incompetent and hearsay.

13 Q. State, if you recollect, when it was that Mr. Sawyer demanded the license to work under the Sawyer-Man patents and inventions, then owned by the Electro-Dynamic Light Company.

A. I think it was in November, 1879.

14 Q. State, if you recollect, when it was that the Eastern Electric Manufacturing Company was organized.

A. I think it was about January, 1880, according to my best recollection.

15 Q. Please state, as near as you can recollect, the date of the purchase or transfer of the Sawyer-Man patents or inventions to the Eastern Electric Manufacturing Company.

A. In April, 1881.

16 Q. Now, what was Mr. Sawyer's attitude, I mean his feelings and purpose in so far as you heard him express any feeling or purpose, with reference to the Sawyer-Man patents and inventions, between the time that he demanded a license to work under such patents and inventions, and the time that the said patents and inventions were transferred to the said Eastern Electric Manufacturing Company?

A. He frequently declared that he would do everything in his power to break these patents down and make them public property, for anybody to use.

17 Q. And was it during this period that Mr. Sawyer
3461 wrote and published the book, marked Edison Exhibit Sawyer Book?

A. It was.

18 Q. Then, as I understand you, it was very shortly after the transfer of the patents and inventions of the Electro-Dynamic Light Company to the Eastern Electric Manufacturing Company that Mr. Sawyer showed you this book and expressed his regret for some things contained in it?

A. It was.

19 Q. Did Mr. Sawyer at that time refer to any particular part of the book as being untrue, or did he merely state to you in a general way that the book contained some things which he regretted, and which were in fact untrue?

A. Merely in a general way without particularizing.

20 Q. Was Mr. Sawyer a large stockholder in the Eastern Electric Manufacturing Company?

A. He was, but he told me he had hypothecated most of his interest to raise money for his own personal wants.

21 Q. State whether you assisted him in the organization of that company.

A. I did.

22 Q. And were you also a large stockholder in that company?

A. I was.

23 Q. State, if you know, whether or not it was one of the purposes of Mr. Sawyer in organizing the Eastern Electric Manufacturing Company to trespass on the Sawyer-Man patents and inventions, and ultimately to get control of them?

A. It was, and he so declared to me.

24 Q. What was Mr. Sawyer's habits as to temperance and sobriety during this time between November, 1879, and the time he showed you his book, as you have stated?

3462 A. I never saw him when he was not under the influence of liquor during that time.

Examination adjourned until 9.30 o'clock a. m., 11th November, 1882.

NEW YORK, *November 11th*, 1882.

Parties met pursuant to adjournment.
Present: Counsel as before.

Examination of Mr. CHURCH continued:

Witness desires to correct his answer to Q. 20 by explaining that although Mr. Sawyer was a large stockholder in the Eastern Electric Manufacturing Company, yet he has not to his knowledge hypothecated his stock of that company. In answering that question he had in mind the stock which Mr. Sawyer owned in the Electro-Dynamic Light Company.

25 Q. State, if you recollect, at any time between November, 1879, and April, 1881, applying to Mr. Sawyer on behalf of myself or Albon Man to execute the necessary papers to reissue the patent granted to Sawyer and Man for an electric lighting system, No. 205,303, and dated June 25, 1878.

A. I do.

26 Q. State whether Mr. Sawyer did execute the paper, and if he didn't state what reason he gave for refusing to do so.

A. He refused to do so, and gave as his reason that he should do everything he could to break the patents as they then stood, unless the company gave him the license that he had requested, and he
finally executed the papers after the patents had been con-
3463 veyed to the Eastern Electric Manufacturing Company by
the Electro-Dynamic Light Company.

27 Q. State if you know, how long the papers had been prepared for that reissue before Mr. Sawyer executed them?

A. Along in October, or November, or December, 1879, that I first spoke to him about executing them.

28 Q. State, if you know, whether or not frequent applications were made to Mr. Sawyer during that time for the execution of those papers, by Albon Man, yourself or others?

A. I remember that frequent applications were made to him to execute these papers, and that he steadily refused to execute them until after patents had been assigned to the Eastern Company in 1881.

29 Q. State, if you know, whether or not one of the principal objects of selling and transferring the patents to the Eastern Electric Manufacturing Company was to get Mr. Sawyer to execute this application for this reissue and to obtain from him certain co*n*venants, agreements in writing, that he would at any time in the future, execute any and all papers that might be necessary, to amend, or in anywise correct, reissue, subdivide any of said patents and applications for patents for any of the inventions that had been previously made by Albon Man and himself.

Objected to as leading.

A. It was.

30 Q. State, if you know, whether Mr. Sawyer, immediately upon the transfer of the patents to the Eastern Electric Manufacturing Company, executed said papers.

A. He did.

31 Q. State whether you were present at such execution?

A. I don't know that I saw him sign them, but immediately after
both Mr. Sawyer and Mr. Broadnax told me that the papers
3464 had been signed. The other papers referred to were signed
at the beginning when the transfer of the patents was made.

32 Q. I call your attention to an article in the New York Herald, of January 5, 1880, entitled "A challenge to Edison," dated January 4, 1880, and addressed to the editor of the Herald, and signed by William E. Sawyer, please read the article, and state if you recollect whether Mr. Sawyer showed it to you, and what he said to you about it at the time it was written, if anything?

A. I saw the article after it was published for the first time. Mr. Sawyer wrote these articles entirely upon his own responsibility. He asked me what I thought of it. I told him I thought he was drunk when he wrote it.

33 Q. Did the conversation end there?

A. Yes.

34 Q. I call your attention to another article in the New York Herald, dated January 6, 1880, entitled "Mr. Sawyer's Exhibitorium," and addressed to the editor of the Herald, and dated January 5, 1880, please read it. State whether Mr. Sawyer called your attention to it at the time, and what, if anything, he said to you about it.

A. He did. It was substantially the same as in the previous occasion referred to in the previous answer.

35 Q. I call your attention to an article in the New York Herald of December 24, 1879, entitled, "Sawyer on Edison and the Herald," dated December 23, 1879, and addressed to the editor of the Herald, please look at it and see if you have read it.

A. I remember the article, and read it at the time of its publication, and that Mr. Sawyer expressed himself as determined to damn everything in the way of electric lighting that had been done by himself and Mr. Man, or by Mr. Edison. Said he would do it if it broke every patent that had been issued to himself and Man, and he would do all he could to destroy the confidence of the public in Mr. Edison.

3465 36 Q. Did you see this article before it was published?

A. I did not.

37 Q. How long after its publication was it that you first saw it, and who called your attention to it?

A. I saw it immediately on its publication, and Mr. Sawyer called my attention to it.

Direct examination closed.

38 X Q. When was the Electro-Dynamic Light Company organized?

A. Early in July, 1878; I think the 6th of July.

39 X Q. Under the laws of the State of New York?

A. Yes.

40 X Q. What was the business basis of that company; upon what patents, if any, was it founded?

A. It was organized upon patents issued to William E. Sawyer and Albon Man, for electric lighting.

41 X Q. Did you hold an office in that company, if so, what office?

A. I did not hold any office in that company.

42 X Q. Was you a stockholder in it?

A. I was.

43 X Q. Was Sawyer an officer and stockholder in that company, or both?

A. He was both.

44 X Q. What office did he hold and what proportion of the stock did he own?

A. He was secretary of the company, and he held a very large amount of the stock. I think a little less than one-third.

45 X Q. Upon what ground did Mr. Sawyer assert his right to a license from that company, as you have testified?

Question objected to on the ground that Mr. Sawyer did not assert any right to a license, but merely insisted upon having one.

3466 A. He wanted and demanded it, that's all.

46 X Q. Upon what ground did he demand the license?

A. No ground; he said he was going to have, and would have it.

47 X Q. Were you present on any occasion when Mr. Sawyer demanded a license from the Electro-Dynamic Light Company?

A. I was present when Mr. Man refused to accede to Mr. Sawyer's demands, and thereupon Mr. Sawyer told Mr. Man that he would do everything in his power to break down those patents.

48 X Q. What had Mr. Man to do with it at that time?

A. Nothing.

49 X Q. What did Mr. Sawyer say when he demanded the license?

A. He told Mr. Man that he wanted the right to manufacture the lamps, and operate the system of electric lighting, as patented by himself and Mr. Man, and if Mr. Man continued to refuse, he would certainly break the patents.

50 X Q. How did he propose to break the patents?

A. He did not say, neither did Mr. Man inquire.

51 X Q. Did Mr. Sawyer assert that Mr. Man knew that he could break the patents of Sawyer and Man?

A. He did not.

52 X Q. About what time was this?

A. It was in the month of November, 1879, in a small office then occupied by Mr. Sawyer in Walker street.

53 X Q. Who else was present besides those you have named?

A. No one but Mr. Man and myself and Mr. Sawyer.

54 X Q. Did you ever hear Mr. Sawyer demand a license at any one time?

A. No, sir.

55 X Q. When Mr. Sawyer demanded the license at that time did he say that he had a right to a license?

3467 A. I don't know that he did—don't remember that he did.

56 X Q. Do you remember that he did not?

A. My best recollection would be that he did not.

57 X Q. What time of the day was this?

A. About 5 o'clock I should think, in the afternoon; Mr. Sawyer's lamp had been lighted.

58 X Q. Was Mr. Sawyer sober at the time?

A. For him, tolerably so, he never was entirely sober.

59 X Q. Was he angry and offensive in his manner?

A. He was angry and offensive.

60 X Q. Did he threaten to destroy the Sawyer-Man patents, before or after Mr. Man's refusal?

A. After.

61 X Q. When he demanded the license on the occasion referred to, did he complain that the company had done nothing in the way of introducing the invention?

A. I do not recollect that he made that complaint, but the company had refused to employ him because of his intemperance.

62 X Q When did the company so refuse to employ him for the reason named?

A. In March, 1879.

63 X Q. In what business or employment was Sawyer engaged at the time he made this demand for a license?

A. He was at work upon a dynamo machine, and also upon a submarine light.

64 X Q. At the time of making this demand did Sawyer ask for employment in the company, or the license you have testified about?

A. He merely demanded the license—said nothing about employment.

65 X Q. When was the Eastern Electric Manufacturing Company organized?

A. I think either in the month of January or February, 1880.

3468 66 X Q. Did that company buy up the stock of the Electro-Dynamic Light Company?

A. No, sir.

67 X Q. What was the basis or foundation for the Eastern Electric Manufacturing Company?

A. Upon patents issued to William Sawyer, William E. Sawyer, Edwin R. Knowles; some to Mr. Stillman—principally to William Sawyer.

68 X Q. In this company were you an officer and stockholder?

A. I was neither.

69 X Q. How was this with regard to William E. Sawyer?

A. I do not know the amount of stock that he held. He was a large stockholder; don't know if he was an officer; he was electrician; he might have been director.

70 X Q. What became of the Electro-Dynamic Light Company?

A. It is still in existence.

71 X Q. And still the owner of the Sawyer-Man patents?

A. No, sir.

72 X Q. Do those patents belong to the Eastern Electric Manufacturing Company?

A. They did, but do not now.

73 X Q. Now explain how the Eastern Electric Manufacturing Company got those patents without buying any stock of the Electro-Dynamic Light Company?

A. They bought the patents of that company.

74 X Q. By that sale did William E. Sawyer get as large an interest in the Eastern Electric Manufacturing Company as he had previously in the Electro-Dynamic Light Company?

A. I don't know what his interest was in either company at the time of that sale. His interest in the dynamic company had at that time been hypothecated to raise money to meat personal expenses, as he told me.

3469 75 X Q. Did Sawyer get employment then in the Eastern Electric Manufacturing Company?

A. Had his office there. He told me he did not receive pay for services.

76 X Q. As I understand you, this transfer put an end to the hostility of William E. Sawyer to the Sawyer-Man patents.

A. It did for a time—only a very short time.

77 X Q. For how long a time?

A. Perhaps a week or two; at longest a month.

78 X Q. After the hostility of Sawyer to the Sawyer-Man patents was renewed, did he still threaten that he could break those patents?

A. He did.

79 X Q. Did he give any reason at any time of the manner in which he could break those Sawyer-Man patents?

A. He did not.

Redirect:

80 R. D. Q. In answer to X Q. 47, you say, "I was present when Mr. Man refused to accede to Mr. Sawyer's demands, and thereupon Mr. Sawyer told Mr. Man that he would do everything to break down those patents."

The next question is, "What had Mr. Man to do with it at that time?" Your answer is, "Nothing." Please state what office, if any, Mr. Man held at that time.

A. He was vice-president of the Electro-Dynamic Light Company, and acting president at that time in the place of the president, Mr. Wallace, and was the chairman of the executive committee. I misunderstood the question, supposing it had reference to what Mr. Man did at the time. Mr. Man at — time made no reply, and took no notice of the threat.

81 R. D. Q. As to this license about which you have testified, upon what terms or conditions did Mr. Sawyer want 3470 to get that license from the Electro-Dynamic Light Company?

A. He offered to pay a royalty that should be satisfactory to the company as a consideration for the license.

Recross:

82 R. X Q. Did Mr. Man give any reason for refusing the license?

A. He did not.

WM. H. CHURCH.

Subscribed and sworn to before me, this 11th day of November, 1882.

J. EDGAR BULL,
Notary Public, New York County, N. Y.

3471 NEW YORK, *November* 10, 1882.

Parties met pursuant to adjournment.

Present: Counsel as before.

ROBERT WHITE, a witness produced on behalf of Sawyer and Man, being duly sworn, in answer to interrogatories propounded by Mr. BROADNAX, testified as follows:

1 Q. What is your name, age, residence and occupation?

A. My name is Robert White; I am twenty-four years old; I reside at No. 50 Clendenny avenue, Jersey City, New Jersey; am a carbonizer.

2 Q. State where and by whom you are at present now employed?

A. I am employed by my father, at 50 Clendenny avenue, Jersey City, N. J.

3 Q. Upon what business are you at present employed?

A. Superintending the repairing of the house, *i. e.*, my father's dwelling.

4 Q. Where were you employed in July, 1881?

A. Was in the employ of Thomas A. Edison, at Menlo Park.

5 Q. State whether you are acquainted with Alexander Welsh?

A. I am.

6 Q. State whether or not you were employed by Mr. Edison as an assistant of Mr. Welsh in July, 1881?

A. I was an assistant to Mr. Welsh at that time, but Mr. Welsh hired me with the knowledge of the superintendent of the Edison electric lamp factory at Menlo Park.

7 Q. State if you recollect of assisting Mr. Welsh to make some specimens of carbon from blotting paper during the time you were employed a- the Edison electric lamp factory?

3472 Counsel for Edison objects to the question on the ground that it calls for evidence not rebutting in its character, and not authorized by the discussion of the Commissioner in reopening this interference.

A. I do.

8 Q. State when it was you assisted Mr. Welsh to make those specimens?

A. To the best of my recollection it was in July, 1881.

9 Q. Was it in the fore part of July, the middle of July, or the last of July?

Same objection.

A. To the best of my recollection it was in the fore part of July, shortly after the fourth.

10 Q. Please to state exactly how those specimens of carbons were made of blotting paper, to the best of your recollection?

Same objection.

A. The blotting paper was placed in an iron mould and covered with charcoal, and then placed in the furnace underneath the boiler, and the mould was brought up to a cherry-red heat, and in taking the mould out the cover was partly knocked off the base of the mould. It was then brought up to the carbonizing department from the boiler-room, and to hasten the cooling of it, Mr. Upton threw water upon it (Mr. Francis Upton); shortly afterwards the carbon was taken out, and we found that they were very poor specimens. I asked for what purpose they were to be used, and was told that they were to be used in a lawsuit that Mr. Edison was interested in. Mr. Francis Upton took them. Mr. Welsh informed me that Mr. Batchelor was to be at the depot to receive the carbons. Shortly afterwards the train passed the factory. I made the remark that Mr. Francis Upton would be too late to deliver those carbons. 3473 Mr. Welsh left the room shortly afterwards, and on his return I asked him if Mr. Francis Upton had seen Mr. Batchelor, and he informed me that Mr. Upton was too late. I asked him what they were going to do about the matter. He told me they were going to send them down to the city by the next train to Mr. Batchelor.

Conversational part of the above answer objected to, as in the nature of hearsay evidence.

11 Q. State, if you recollect whether these specimens of carbon, when they were given to Mr. Upton, or when Mr. Upton took them, were put into a box, and if so, what kind of a box?

Same objection as to question 7.

A. To the best of my recollection they were put in a pasteboard box—a light-colored pasteboard box; I don't remember the size as I merely glanced at it.

12 Q. Who told you that these specimens were to be used as exhibits in a lawsuit in which Mr. Edison was interested?

Same objection.

A. Mr. Welsh.

13 Q. Did you make any remark in reply to Mr. Welsh's statement at the time?

Same objection.

A. I told them they were damned poor specimens.

14 Q. Did Mr. Welsh tell you what lawsuit they were to be used in?

Same objection.

A. He did not.

15 Q. Were they in fact poor specimens?

Same objection.

3474 A. They were about as poor as could be obtained for to be carbonized.

16 Q. Do you mean, by your last answer, that the specimens of carbon were about as poor as they could be?

Same objection.

A. The manner in which they were run through would produce about as poor results as could be obtained.

17 Q. Did you, before or after that, during your employ at the Edison electric lamp factory, assist Mr. Welsh or any one else, to make such specimens of carbonized blotting paper?

Same objection.

A. Not such specimens as those were; but I have made some for the purpose of gaining experience.

18 Q. Do you mean by your last answer, that you made other specimens of carbonized blotting paper, for the purpose of gaining experience in the carbonization of paper and other substances?

Same objection.

A. I do.

19 Q. Was that before or after these specimens were made about which you have been testifying?

Same objection.

A. To the best of my recollection they were afterwards.

20 Q. How long afterwards, to the best of your recollection?

Same objection.

A. About the middle of July.

3475 21 Q. Referring to these last experiments, were they made in the same way that those were made about which you have been testifying?

Same objection.

A. They were not.

22 Q. What was done with them?

Same objection.

A. They were fastened together with some adhesive substance and covered with charcoal and weighted and run through the carbonizing furnace regularly.

23 Q. What was done with the specimens after they were made?

Same objection.

A. Mr. Welsh received them.

24 Q. Were these specimens made of blotting paper, last referred to by you, and made for the purpose of gaining experience in carbonizing, better than those you made in the box in the boiler furnace about which you have been testifying?

Same objection.

A. They were much better.

25 Q. Do you know whether or not these last-mentioned specimens were put in the lamps, and used for electric lighting?

Same objection.

A. I do not, positively; but I understood they were to be used for that purpose.

Direct examination of witness closed.

3476 Counsel for Edison not waiving any of his rights of objection, or waiving the objections heretofore made, proceeds to the cross-examination of the witness.

26 X Q. What was your business or occupation before you began work at the lamp factory at Menlo Park?

A. Plumber.

27 X Q. When did you begin work at Menlo Park?

A. To the best of my recollection, the latter part of March, 1881.

28 X Q. When did you quit work at Menlo Park?

A. To the best of my recollection, the latter part of January, 1882.

29 X Q. What did you do at Menlo Park before you began to help Mr. Welsh?

A. Nothing; I assisted Mr. Welsh from the time of entering their employ.

30 X Q. What was the special nature of your assistance?

A. Helping him in any way he desired me at the furnace.

31 X Q. Did you keep up the fire or the heat in the furnace?

A. If the fireman should be absent for a short time, I would replenish the fire.

32 X Q. What time of the day or night was it when the work was commenced on these blotting-paper carbon specimens?

A. To the best of my recollection, it was about 8'o'clock in the morning.

33 X Q. Was Mr. Francis Upton present during the whole time?

A. No, sir; he was not.

34 X Q. What portion of the time was he present?

A. When the specimens were being prepared, and on their being brought up to the carbonizing department after being carbonized.

35 X Q. Have you talked with Mr. Welsh about this matter?

3477 A. I have had a short conversation with him on this subject.

36 X Q. When was that?

A. Last night.

37 X Q. Where was it?

A. At his home.

38 X Q. How did you happen to go there?

A. He called at my house and told me he would like to see me in the evening.

39 X Q. Did he tell you that he had been testifying?

A. He did.

40 X Q. Did he tell you the substance of the testimony?

A. He did not.

41 X Q. Did he tell you what he had been testifying about?

A. He did.

42 X Q. Did he ask you to come here to-day as a witness?

A. He did.

43 X Q. Did you tell him in the conversation what you recollected about making these blotting-paper carbons?

A. I did not give him all the particulars.

44 X Q. Did you tell him substantially as you have testified that morning?

A. I did not.

Cross-examination closed.

46 R. D. Q. During the time of the making of these specimens of carbon blotting paper was Mr. Francis Upton present when the carbons were put in the box, when the box was put in the furnace of the boiler, and during the time it was in the boiler furnace, and when the box was taken out of the furnace?

A. Mr. Francis Upton was present when the specimens were being prepared, and from the time it was brought from the carbonizing department to their being delivered to him.

3478 47 R. D. Q. I do not understand just what you mean by your last answer; was Mr. Upton present when the blotting paper was put in the box?

A. He was present when it was being prepared to go into the box; to the best of my recollection, he was present when it was put in the box.

48 R. D. Q. Was he present when the box was put in the furnace of the boiler?

A. He was not.

49 R. D. Q. Was he present during the time the box was in the furnace of the boiler?

A. To the best of my recollection he was not.

50 R. D. Q. Was he present when the box was taken out of the furnace?

A. He was not.

51 R. D. Q. How far is this boiler-room from the carbonizing-room?

A. To the best of my judgment about 150 feet.

52 R. D. Q. Now, when this box was taken out of the boiler furnace, was it taken directly to the carbonizing-room?

A. It was.

53 R. D. Q. And was it in the carbonizing-room that Mr. Upton threw the water on the box?

A. It was.

54 R. D. Q. During the time of the carbonization of these specimens, was Mr. Batchelor present any of the time?

A. I did not see him.

Examination of witness closed.

ROBERT WHITE.

Subscribed and sworn to before me this 10th day of November, 1882.

J. EDGAR BULL,
Notary Public, N. Y. Co. N. Y.

3479 Edward R. Knowles, a witness produced on behalf of Sawyer and Man, being duly sworn, in answer to interrogatories propounded by Mr. Broadnax, deposes as follows:

1 Q. What is your name, residence, age and occupation?

A. My name is Edward R. Knowles; age, thirty-one; residence, 122 South Elliott place, Brooklyn; occupation, civil and electric engineer.

2 Q. State whether you are acquainted with William E. Sawyer and Albon Man, and if yea, state when you made their acquaintance as near as you can't recollect?

A. I am acquainted with them; I first met Mr. Sawyer about the 2d of November, 1878, at his laboratory in 94 Walker street; also met Mr. Man at the same place, about the same time, or shortly after.

3 Q. State how you came to make the acquaintance of Mr. Sawyer and Mr. Man?

A. I made their acquaintance through being engaged by them to make drawings for their inventions and to obtain patents.

4 Q. State whether you had any business or social relations with Mr. Sawyer in May, 1879?

A. I was engaged in making drawings for him at that time.

5 Q. State, if you know, whether there occurred between Mr. Sawyer and Mr. Man any difference in their relations, and if so, please state what you know or what Mr. Sawyer told you about it?

A. Well, there occurred a difference between Mr. Sawyer and Mr. Man; I went there at Mr. Sawyer's office from day to day to get drawings, and about the 20th of May Mr. Sawyer told me that he had a split with the Electro-Dynamic Light Company, that they could not agree together, and that the laboratory would be closed.

6 Q. What laboratory do you refer to?

3480 A. The Electro-Dynamic Light Company's laboratory, 94 Walker street.

7 Q. State, if you know, whether that laboratory was closed subsequently, and when it was closed.

A. It was closed; I went there several times and could not get in, and it was closed about the latter part of May, 1879.

8 Q. Where did Mr. Sawyer then locate himself?

A. He took a small office at No. 80 Walker street, at the corner of Courtlandt alley.

9 Q. State, if you know, whether Mr. Sawyer went to Ansonia at that time, and, if so, about how long he remained there?

A. He went to Ansonia on the 22d May, 1879; I can't say how long he stayed there; I next saw him, however, in the early part of September, 1879, at 80 Walker street.

10 Q. State what, if any intercourse you had with Mr. Sawyer, after his return from Ansonia.

A. I still continued to make his drawings for him; he spoke about a new lamp and generator that he was devising, and hinted that it would get around the patents held by the Electro-Dynamic Light Company; he spoke of an exhibition that he was about to make at 226 West Fifty-fourth street, that he proposed to form a new company to work this lamp and machine.

11 Q. State, if you know, whether, in fact, he did form a new company, and what the name of the new company was?

A. He did form a new company; it was called the Eastern Electric Manufacturing Company.

12 Q. After Mr. Sawyer's return from Ansonia, and before the organization of the new company, what, if any, feeling did he express towards the Electro-Dynamic Light Company and Mr. Man?

A. Whenever he spoke with me upon the subject, he expressed himself as strongly opposed to them and their interests.

13 Q. State whether his expressions of opposition were pronounced and bitter?

A. They were.

3481 14 Q. And manifested a determination on his part to do what he could to injure them?

A. They did.

15 Q. State, if you know, whether Mr. Sawyer did, in fact, make his exhibition at 226 West Fifty-fourth street, and if so, state what it was.

A. He did the exhibition the first part of January, 1880.

16 Q. State, if you know, when the new company, the Eastern Electric Manufacturing Company, was organized.

A. Somewhere about the 8th of January, 1880.

17 Q. State where Mr. Sawyer's office was at that time, or his place of business.

A. It was on Elm street, between Canal and Grand, in New York.

18 Q. State whether or not you afterwards went into the employ of the Eastern Electric Manufacturing Company, and if yea, when and where?

A. I went into their employ 22d November, 1880, at 97 Fulton street, New York.

19 Q. State whether Mr. Sawyer was employed then also by that company; also state, if you know, in what capacity he was employed.

A. He was employed then as chief electrician for that company.

20 Q. State, if you know, when the shop at 97 Fulton street was opened?

A. In the latter part of March, 1880.

21 Q. What business was carried on at that works?

A. The making of incandescent electric lamps, dynamo-electric machines, and all necessary experiments and apparatus for the completion of an electric lighting system.

22 Q. In what capacity were you employed there?

A. As assistant electrician.

23 Q. How long did you remain there as assistant electrician?

3482 A. I was assistant electrician until the 22d of November, 1881.

24 Q. State, if you recollect of Mr. Sawyer writing and publishing a book entitled "Electric Lighting by Incandescence," during the time that you were employed there as assistant electrician?

A. I do.

25 Q. Please to look at this book I now show you, marked Edison's Exhibit Sawyer Book, and state if you recognize it as the book referred to by you in your last answer.

A. I do.

26 Q. State whether you made any of the drawings illustrating that book.

A. I did; a portion of them.

27 Q. State, if you know, whether during the time of the writing of such book, Mr. Albon Man visited Mr. Sawyer at the works at 97 Fulton street.

A. He did, two or three times.

28 Q. State, if you recollect, what Mr. Sawyer said upon the occasion of Mr. Man's visits as to his feelings towards Mr. Man and the Electro-Dynamic Light Company.

A. He always acted very fair with Mr. Man while he was present, but spoke against him when he was gone.

29 Q. From what you heard Mr. Sawyer say of Mr. Man and the Electro-Dynamic Light Company, what opinion did you get of Mr. Sawyer's attitude towards them during the time of writing this book?

A. I formed the opinion that he disliked Mr. Man very much, and was very much opposed to the company.

30 Q. Did his expressions leave upon your mind the impression that his hostility was pronounced and unscrupulous?

A. It did.

31 Q. State where you are at present employed.

A. As electrician of the Consolidated Electric Light Company, 127 and 129 Front street, Brooklyn.

3483 32 Q. State whether you are acquainted with Alexander Welsh.

A. I am.

33 Q. State whether you were present this morning at the time he gave his testimony in this case.

A. I was.

34 Q. State whether you saw the specimens of carbon produced by him and put in evidence as exhibits in this case.

A. I did.

35 Q. State, if you please, whether you saw those specimens of carbon made, and of what they were made.

A. I saw them made, they were made of blotting paper.

36 Q. State whether Mr. Welsh's statement of the facts of the preparation of the blotting paper, of its carbonization, and of its tests, accords with your own knowledge of the facts of such preparation, carbonization and tests of said carbons.

A. It does; all except to the test which I did not see performed.

37 Q. State what, if any, experience you have had in making carbons of paper for incandescent electric lighting.

A. I have made paper-carbon loops for incandescent lighting from a number of different kinds of paper a great many times.

38 Q. State when and where you first made such loops.

A. A number of times during the year 1880, at 97 Fulton street, New York city, also at 65 Henry street, Brooklyn, during the year 1882.

39 Q. When you made such carbons at 97 Fulton street, in the year 1880, was that before you made the acquaintance of Mr. Welsh?

A. It was.

40 Q. How long before?

A. About two years.

3484 41 Q. How did you make such loops of carbon? Please describe how you carbonized, and name the different kinds of paper you used in such carbonization.

A. I have made carbon loops from card and bristol board, writing and brown wrapping paper, drawing and blotting paper. I have made them of various forms, in loops or circles, crosses, stars, and a variety of forms. The form I preferred was made by cutting a circular disk with a steel punch from blotting paper, and with a smaller-sized punch cutting another circular disk out of the first disk, thus leaving a narrow circle of paper. In carbonizing, I took a thin sheet or plate of battery carbon, placed a number of these circles upon it, leaving the central portion in them to prevent distortion. I placed on these another plate of carbon, then on that plate more circles, and so on, finishing the pile with a plate of carbon, the whole was then bound strongly together with wire and placed in a black-lead crucible and surrounded and covered by finely powdered carbon. The crucible was then set in a blacksmith's forge, a thick piece of sheet *of* iron lain on top of the crucible, and a fire built all around it and over it. The heat was gradually raised to a bright red, and maintained at that temperature for a long time. The crucible was then allowed to cool, after which, the carbons were taken from it.

42 Q. What use did you make of the carbons you have described in your last answer?

A. I used them for incandescent conductors in electric lamps.

43 Q. In the lamp known as the Sawyer and Man lamp?

A. Yes.

44 Q. Was this during the time that you were assistant electrician with Mr. Sawyer?

A. It was.

45 Q. How long were these carbons continued in a state of incandescence?

3485 A. I have had them run all the way from ten hours to thirty-six hours.

46 Q. And then did they fracture in the lamp?

A. They generally broke close to one of the retaining clamps.

47 Q. State, if you know, why they broke.

A. The interior parts of the lamp were too rigid and did not give quick enough when a current of electricity was suddenly turned on the lamp.

48 Q. Do you wish to be understood as saying that the disruption of the carbon was due to the construction of the machinery of the lamp, or was it due to any imperfection in the carbon?

A. It was due to imperfections in the mechanism of the lamp.

49 Q. Are any of these carbons to which you have referred as being used for illuminating conductors in the lamps made of blotting paper?

A. They were most all made of blotting paper.

50 Q. Previous to the carbonization of the blotting paper was it subjected to a treatment of any kind, or was it carbonized in its natural state?

A. It was carbonized in its natural state.

51 Q. After it was carbonized was it subjected to any treatment, and if yea, what treatment was it subjected to?

A. They were all treated in a hydrocarbon, either a gas or fluid, but generally in ordinary illuminating gas. They were treated by bringing them to incandescence by means of a current of electricity while surrounded by the hydrocarbon. The effect of this treatment was to render them exceedingly dense and hard, so much so that I usually finished them with a file and emery paper.

52 Q. Please to produce any specimens you may have of carbonized blotting paper made by you in the year 1880, previous to their treatment and use as illuminating conductors in the lamps, as you have stated.

A. I now produce two of the U loops and two circles of
3486 carbons made of blotting paper, made during 1880 while I
was with Sawyer as assistant electrician.

Specimens of carbon produced by the witness offered in evidence and marked, Knowles Exhibit Paper Carbon.

53 Q. In preparing these carbons to put in the lamps, what, if anything, did you do to them to make the circuit complete?

A. The carbons were placed in a pair of clamps, and the portion between the clamps on the under side was broken away, they were then treated as before described, smoothed, the ends plated with copper, and they were inserted in the clamps of the lamp, and the lamp sealed and charged with pure nitrogen gas.

54 Q. Are these specimens of carbon of the same size and form as those you used in the lamps of 1880, as you have stated?

A. They are.

55 Q. And they were made in the same way, are the same in every respect, as I understand you, excepting that they have not been treated with an electric current in the pressure of a hydrocarbon gas or liquid; is that correct?

A. Yes; they are.

So much of the foregoing testimony as relates to experiments made in 1880, is objected to as immaterial, and not included in the decision in the reopening of this case.

56 X Q. What were you doing between the time of your employment by the Eastern Electric Manufacturing Company, and the time you entered the employment of the Consolidated Electric Light Company?

A. I was employed as an assistant engineer on the East River bridge, and from thence I went into the employ of the American Electric Light Company, and on the consolidation of that company with the Eastern Electric Light Company, went into the employ of the Consolidated Electric Light Company.

3487 57 X Q. When you left the employment of the Eastern Electric Manufacturing Company were your relations friendly with Mr. W. E. Sawyer?

A. Reasonably so; I have not met him for eight or nine months.

58 X Q. How has he been since?

A. I have not seen him since and have no unfriendly feelings towards him whatever.

Redirect:

59 Q. During the time while Mr. Sawyer was writing the book, Edison Exhibit Sawyer Book, what were his habits, temperate or intemperate, in other words, drunk or sober, most of the time?

A. During the daytime, while I was with him, he was under the influence of liquor the larger portion of the time.

E. R. KNOWLES.

Subscribed and sworn to before me this 23rd day of November, 1882.

EXHIBITS.

Agreement between W. E. Sawyer and Albon Man.

Memorandum of agreement between Wm. E. Sawyer, of the first part, and Albon Man, of the second part.

The party of the first part has made certain inventions and obtained certain patents having reference to the distribution, regulation, production and use of electricity, and especially its use for electric lighting and the forms of burners or lamps, and the media, menstru-m or bath, in which light is produced to prevent oxidation, combustion and — and is engaged in experiments in these matters to render the same practical, has agreed to sell and convey to the party of the second part*y* fifty-five one-hundredths parts of all his said inventions and patents and discoveries of and concerning the use, distribution, regulation and production of electric currents, especially as relating to electric lighting and all other matters and things effecting the same, for the sum of $2,500, to be paid to the party of the second part within two months as he may require it—he to procure all necessary patents at his own expense. Man to have ten days to complete his arrangements for associates with him, and $150 to be paid to Sawyer meantime for experiment under the agreement with and between these parties dated February 15, 1878. When all is completed and signed, Sawyer to go on with his experiments and take out his patents, and whenever Man and his associates are ready, a joint stock company to be formed and all inventions and patents to be assigned to it and the stock to go, fifty-five one-hundredths to Man and his associates, and forty-five one-hundredths to Sawyer.

3489 This has no reference to Sawyer's patent electric engine or telegraphs, but does to and includes inventions and discoveries made in aid of electric lighting or other uses of electricity under the experiments above referred to. Dated March 19, 1878.

W. E. SAWYER.
ALBON MAN.

Witness:
WM. H. ALLEN.

Recorded in Liber A 28, p. 117, April 4, 1882.

3490 *Agreement between W. E. Sawyer and Albon Man.*

NEW YORK, *May* 11, 1882.

Whereas, on the 19th day of March, 1878, an agreement was made between the parties hereto, in which reference for particulars is hereby made; and

Whereas, contrary to the expectations of the parties, the plans originally proposed by the party of the first part did not prove practically successful, and the party of the second part then came in and made certain suggestions which were generally adopted, and has, from time to time, made suggestions in relation to the subject-matters of said agreement, which have been adopted, and through which suggestions it is believed that success has been achieved; and

Whereas, the parties hereto are unable to distinguish which of them is the author of different parts of the inventions hereinafter referred to:

Therefore, it is hereby agreed by and between William Edward Sawyer, party of the first part, and Albon Man, party of the second part, in modification of their previous agreement, as follows:

That instead of the letters patent being taken out in the name of the party of the first part solely, that they shall be taken out in the names of both parties hereto, and the interest to be held by said parties in the same shall be to the party of the first part .45, and to the party of the second part .55. In other respects the agreement of March 18, 1878, referred to, shall stand, except that the party of the second part is considered to have accepted, and does hereby accept the inventions mentioned in said agreement and those inven-

tions jointly made by himself and the party of the first part, to wit, .55 of the same, for the sum of $2,500, of which sum the
3491 party of the first part hereby acknowledges the receipt of $1,372.75; the balance, viz., $1,127.25, to be paid to the party of the first part, from time to time, as he may call for the same, to cover the expenses of letters patent about to be applied for in the United States, and to meet his personal expenses.

Certain inventions, covered by letters patent in the United States, as follows: "Electric engineering and lighting apparatus and system," No. 194,111, dated August 14, 1877; "electric candles," No. 194,500, dated August 21, 1877; "electric lighting apparatus," No. 194,563, dated August 28, 1877; and "electric engineering and lighting system," No. 196,834, dated November 6, 1877; having been assigned to the extent of $\frac{3}{5}$ thereof to James Flanagan, and the party of the first part claiming that he has the right, as he stated at the time of making the agreement of March 19, to withdraw the same from the said Flanagan and obtain a reassignment thereof within one year from about the 15th of February last, the party of the first part hereby agrees to assign to the party of the second part the remaining $\frac{2}{5}$ of said patents, which he now holds, and within the time limited by his agreement with said Flanagan, to redeem from him the other $\frac{3}{5}$, and assign the same to the company to be formed by the party of the second part for the purpose of holding and operating under all the patents obtained and to be obtained, which are referred to in this agreement and in the agreement of March 19, 1878.

The inventions herein referred to, which are jointly to be patented by the parties hereto, are to be considered as though they had been the sole inventions of the party of the first part under the agreement of March 19, 1878, and a joint stock company is to be formed and all the patents obtained and to be obtained, as proposed in said agreement, are to be assigned to the said company when formed, including the $\frac{2}{5}$ interest in the four Flanagan patents hereinbefore enumerated and agreed to be assigned to the party of the
3492 second part, and the stock of the company is to be distributed as set forth in said agreement.

The joint inventions of the parties hereto being at present as follows:

Electric lamp,
Regulators for electric lamps, and
Electric lighting system,

and other apparatus and inventions now under consideration. It is fully agreed that the party of the first part shall devote his time and attention exclusively to perfecting the same and to the procurement of United States letters patent upon the same, the expenses of procuring said patents to be borne by him; but after the proposed company is formed, which shall be with all reasonable dispatch after the joint patent on the lamp is obtained, the company is to bear the expenses of all new patents and new inventions.

And the said Sawyer hereby agrees to assign to said company any rights remaining to him in any of his telegraphic inventions, in so far as their application to the purpose of electric lighting is concerned.

W. E. SAWYER.
ALBON MAN.

Witness:
R. M. STRATTON.

Recorded in Liber A 28, p. 118, April 4, 1882.

3493 *Assignment: W. E. Sawyer to Albon Man.*

For and in consideration of one dollar, to me in hand paid by Albon Man, of Brooklyn, New York, and for other good and valuable considerations passing from the said Albon Man to me, the receipt whereof is hereby admitted, I, William E. Sawyer, of the city of New York, have sold, assigned and set over to the said Albon Man, and hereby do sell, assign, transfer, convey and set over unto him, his heirs, executors and assigns forever, two-fifths of each of the following letters patent issued by the United States of America to me, namely, letters patent for "electric engineering and lighting apparatus and system," No. 194,111, dated August 14th, 1877; letters patent for "electric candles," No. 194,500, dated August 21, 1877; letters patent for "electric lighting apparatus," No. 194,563, dated August 28, 1877; and letters patent for "electric engineering and lighting system," No. 196,834, dated November 6, 1877; together with a two-fifth interest in the inventions covered by the said letters patent, or intended to be, with all modifications reissues and extensions thereof, made or to be made, had, obtained or granted to me, my executors, administrators, heirs or assigns. And I do hereby covenant to and with the said Albon Man, his heirs, executors, administrators and assigns, as follows, viz: 1st. That I am the sole and absolute owner at the time of this conveyance of the two-fifth interest in the before-mentioned letters patent, four in number, and have good right and authority to sell and convey the same in manner aforesaid. 2d. That said two-fifth interest in each and every of the four letters patent hereinbefore mentioned, hereby conveyed, or intended to be, is wholly unincumbered and free from all manner of charges, liens, mortgages, conveyances and grants of what nature and kind soever, and solely vested in me at the time of this conveyance. 3d. That I, my heirs, executors or administrators, at the reasonable request of the said Albon Man, his executors, administrators,
3494 heirs, or assigns, and at his or their cost and expense, will
make any other assignment or conveyance for the better assuring the title of the said two-fifths interest in the said letters patent in him, them or either of them, which by him, them or his, or their counsel learned in the law shall be reasonably advised, devised or required; and further, that for the better protection of my said assignee and grantee, his heirs, executors, administrators and assigns, I, my heirs, executors and administrators shall and will, at his or their expense, make any explanations for reissue of any of said patents from time to time, and for modifications thereof, and

for extension thereof, which he, they or his or their counsel learned in the law may advise or request, and assign and convey all such reissues (to the extent of the two-fifths interest hereby granted), modifications and extensions to said Man, his heirs, executors, administrators and assigns.

4th. I do hereby covenant for myself, my executors and administrators, to warrant and defend the title of the said Albon Man, his heirs, executors, administrators and assigns, in and to the said two-fifths interest in the said letters patent hereby granted or intended to be, against all persons claiming or to claim the same by, through or under me in any manner whatsoever.

In witness whereof, I have hereto set my hand and seal this 14th day of May, one thousand eight hundred and seventy-eight.

W. E. SAWYER. [SEAL.]

Sealed and delivered in presence of—
WM. SAWYER.

3495 STATE OF NEW YORK,
City and County of New York, } *ss:*

On this 14th of May, 1878, before me personally came William E. Sawyer, to me well and personally known, and known to me to be the same person described in and who executed the foregoing instrument, and acknowledged to me that he executed the same.

J. C. CROKER,
Notary Public, N. Y. Co.

County clerk's certificate appended.
Recorded in Liber S 22, p. 494, May 16, 1878.

3496 *Assignment: Sawyer and Man to Electro-Dynamic Light Co.*

Whereas, William E. Sawyer, of Brooklyn, N. Y., and Albon Man, of New York, N. Y., did obtain letters patent of the United States of America for certain improvements in electric lighting systems, which letters patent bear date the 25th day of June eighteen hundred and seventy-eight, and numbered 205,303;

And whereas, the Electro-Dynamic Light Company, a corporation formed under the laws of the State of New York, is desirous of acquiring an interest therein:

Now this indenture witnesseth, that for and in consideration of the issuing to us of stock and scrip of said company, and of the sum of one dollar to us, the said Sawyer and Man, in hand paid, the receipt of which is hereby acknowledged, we have assigned, sold and set over, and do hereby assign, sell and set over unto the said The Electro-Dynamic Light Company all the right, title and interest which we have in said invention, as secured to us by said letters patent, the same to be held and enjoyed by the said The Electro-Dynamic Light Company for its own use and behoof, and for the use and behoof of its legal representatives, to the full end of the term for which said letters patent are granted, as fully and entirely as the same would have been held and enjoyed by us if this assignment and sale had not been made, together with all renewals thereo and improvements thereon.

In testimony whereof we hereunto set our hands and affix our seals this 15th day of June, eighteen hundred and seventy-eight.

W. E. SAWYER. [SEAL.]

WILL. MAN.

Recorded in Liber C 24, page 300, May 29, 1879.

3497 *Assignment: Sawyer and Man to Electro-Dynamic Light Co.*

Whereas, William E. Sawyer and Albon Man did obtain letters patent of the United States of America for certain improvements in electric lamps, which letters patent bear date the 18th day of June, eighteen hundred and seventy-eight, and numbered 205,144.

And whereas, the Electro-Dynamic Light Company, a corporation formed under the laws of the State of New York, is desirous of acquiring an interest therein.

Now, this indenture witnesseth, that for and in consideration of the issuing to us of stock and scrip of the said company and of the sum of one dollar to us, the said Sawyer and Man, in hand paid, the receipt of which is hereby acknowledged, we have assigned, sold and set over, and do hereby assign, sell and set over unto the said The Electro-Dynamic Light Company, all right, title and interest which we have in the said invention, as secured to us by said letters patent.

The same to be held and enjoyed by the said The Electro-Dynamic Light Company for its own use and behoof, and for the use and behoof of its legal representatives to the full end of the term for which said letters patent are granted, as fully and entirely as the same would have been held and enjoyed by us if this assignment and sale had not been made, together with all renewals thereof and improvements thereof.

In testimony whereof we hereunto set our hands and affix our seals this 15th day of July, eighteen hundred and seventy-eight.

W. E. SAWYER. [SEAL.]
ALBON MAN. [SEAL.]

Sealed and delivered in presence of—
WILL. MAN.

Recorded in Liber C 24, page 299, May 29th, 1879.

3498 *Agreement: Sawyer and Man to Electro-Dynamic Light Co.*

Whereas, William E. Sawyer, of New York, and Albon Man, of Brooklyn, New York, did obtain letters patent of the United States of America for certain improvements in regulators for electric lights, which letters patent bear date the 25th day of June, eighteen hundred and seventy-eight, and numbered 205,305.

And whereas, the Electro-Dynamic Light Company, a corporation formed under the laws of the State of New York, is desirous of acquiring an interest therein.

Now this indenture witnesseth, that for and in consideration of the issuing to us of stock and scrip of the said company and of the sum of one dollar to us, the said Sawyer and Man, in hand paid, the receipt of which is hereby acknowledged, we have assigned, sold and set over, and do hereby assign, sell and set over, unto the said The Electro-Dynamic Light Company all the right, title and interest which we have in the said invention, as secured to us by said letters patent.

The same to be held and enjoyed by the said The Electro-Dynamic Light Company for its own use and behoof, and for the use and behoof of its legal representatives, to the full end of the term for which said letters patent are granted, as fully and entirely as the same would have been held and enjoyed by us if this assignment and sale had not been made, together with all renewals thereof or improvements ther-n.

In testimony wher-*h*f we hereunto set our hands and affix our seals this 15th day of July, eighteen hundred and seventy-eight.

3499 *Assignment: A. Man to Electro-Dynamic Light Co.*

Whereas, I Albon Man, of the city of New York, have heretofore become interested with William E. Sawyer in various patents and inventions having general reference to the subject of producing light by means of electric currents and to the producing and conducting of such currents; now, in consideration of one dollar to me paid by the Electro-Dynamic Light Company, I do hereby sell, assign, transfer and set over to the said company, its successors and assigns, absolutely, certain agreements, and all my right, title and interest thereunder and therein, and all rights to accrue therefrom to me, which were made by me with the said William E. Sawyer, and which are dated respectively, February 15, 1878, March 19th, 1878, March 25, 1878, and May 11, 1878, together with the right to receive, take and hold any letters patent of the United States, or interest in or under any such letters patent, and all interests in improvements in electric apparatus, systems or lights in the said agreements referred to, as fully as the same are secured to me under the said agreements, I hereby relinquish in favor of said company, all my right, title and interest of every kind under the said agreements, for the United States of America.

In witness whereof I have hereunto set my hand and seal the fifteenth day of July, one thousand eight hundred and seventy-eight.

ALBON MAN.

Sealed and delivered in presence of—

WILL. MAN.

Recorded in Liber A 28, page 121, April 4th, 1882.

3500 *Assignment: Sawyer and Man to Electro-Dynamic Light Co.*

Whereas, we, William Edward Sawyer, of the city, county and State of New York, and Albon Man, of Brooklyn, county of Kings and State aforesaid, have made the following-entitled invention, viz:

Firstly. Certain improvements in "electric lighting apparatus and circuits."

Secondly. Certain improvements in "carbons for electric light" and in the treatment thereof;

—for which we are about to apply for letters patent of the United States; and whereas, the "Electro-Dynamic Light Company," a corporation created and existing under and by virtue of the laws of the State of New York, have purchased of us all our right, title and interest in and to said inventions, and any and all letters patent of the United States which may hereafter be granted for the same, and has paid us for the said inventions the sum of one dollar and given us other good and sufficient consideration for the same, the receipt of which we hereby acknowledge and with which we hereby declare ourselves satisfied, contented and paid; Now, therefore, upon consideration aforesaid, we the said William Edward Sawyer and Albon Man, have and do hereby sell, assign and convey to the said company the whole of our right, title and interest in and to said inventions and any and all United States letters patent which may hereafter be granted for the same, for the said company to have, hold and enjoy for its own use and behoof, and for the use and behoof of its legal representatives, as fully and entirely as we would have held and enjoyed the same had this assignment and sale not been made, for the whole term for which said letters patent may be granted, including any extensions thereof, and through the whole of the United States and territories thereof, and we do hereby covenant, for ourselves and our legal representatives, that we are 3501 now the sole owners of said inventions, and have good right and lawful authority to make and execute this conveyance in manner aforesaid, and that we will at any and all proper and reasonable times make and execute any and all proper papers that may be necessary to apply for and obtain letters patent of the United States for said inventions, and any and all proper papers that may be necessary to vest the title thereof in said corporation.

In witness whereof, we have hereunto set our hands and seals this the 14th day of October, 1878.

3502 *Assignment: W. E. Sawyer to Electro-Dynamic Light Co.*

Whereas, I, William Edward Sawyer, of the city, county and State of New York, have made the following-entitled invention, viz:

A new and useful electric meter, for which I am about to apply for letters patent of the United States;

And whereas, the Electro-Dynamic Light Company, a corporation created and existing under and by virtue of the laws of the State of New York, has purchased of me all my right, title and interest in and to said invention, and any and all letters patent of the United States, which may be hereafter granted for the same, and has paid me for the said invention the sum of one dollar, and given me other good and sufficient consideration for the same, the receipt of which is hereby acknowledged, and with which I hereby declare myself satisfied, contented and paid;

Now, therefore, upon consideration aforesaid, I, the said William Edward Sawyer, have and do hereby sell, assign and convey to the said company the whole of my right, title and interest in and to said invention, and any and all letters patent of the United States, which may hereafter be granted for the same. For the said company to have, hold and enjoy for its own use and behoof, and for the use and behoof of its legal representatives as fully and entirely as I would have held and enjoyed the same, had this assignment and sale not been made, for the whole term for which said letters patent may be granted, and through all the renewals and extensions thereof, throughout the whole of the United States and the territories thereof.

And I do hereby covenant for myself and my legal representatives, with said company that I am now the sole owner of said invention and have good right and lawful authority to make
3503 and execute this conveyance in manner and form as aforesaid. And that I will at any and all proper and reasonable times, make and execute any and all proper papers that may be necessary to apply for and obtain letters patent of the United States for s-id invention, and any and all proper papers that may be necessary to vest the title thereto in said company.

[SEAL.] In witness whereof, I have hereunto set my hand and seal in presence of the subscribing witness.

3504 *Assignment: Sawyer and Man to Electro-Dynamic Light Co.*

Whereas, we, William Edward Sawyer of New York city, and Albon Man of the city of Brooklyn, have invented certain new and useful improvements in electric lamps, for which we, on the fourth day of November, 1878, made application for letters patent of the United States in due form of law:

And whereas, the Electro-Dynamic Light Company, a corporation duly created and organized under and by virtue of the laws of the State of New York, and having its principal place of business at No. 94 Walker street, in the city of New York, has purchased of us all our right, title and interest in and to said invention, and has paid us therefor the sum of one dollar, and given us other good and sufficient consideration for the same, the receipt of which we hereby acknowledge, and with which we hereby declare ourselves satisfied, contented and paid;

Now, therefore, for the consideration aforesaid, we, the said Sawyer and Man, have, and we do hereby assign, transfer and convey to the said Electro-Dynamic Light Company all our right, title and interest in and to said invention, and in and to any and all letters patent of the United States, which may be granted or obtained for the same, in and for the whole of the United States and the territories thereof, for the whole of the term of said letters patent, and through all the renewals and extensions thereof, for the said company to have, hold and enjoy for its own use and behoof and for the use and behoof of its legal representatives as full- and entirely as we would have held and enjoyed the same had this assignment and sale not been made.

And we, the said Sawyer and Man, do hereby covenant with the said company that previous to, and at the time of selling said invention to said company, as aforesaid, we were the sole owners of said invention described, illustrated and claimed in 3505 said application for a patent, and that we have now good right and lawful authority to make this assignment, and convey the whole of the title to said invention and letters patent, hereby conveyed, or intended so to be, in manner as aforesaid; and that we will, at any and all reasonable times, make, execute and deliver, at the cost of said company, any and all papers or instruments of writing necessary in the law to obtain any reissue or extension of said letters patent, and vest the title thereof in said company.

In witness whereof, we have hereunto set our hands and seals this sixth day of November, 1878.

3506 *Assignment: W. E. Sawyer to Electro-Dynamic Light Co.*

Whereas, I, William Edward Sawyer, of the city, county and State of New York, have invented certain improvements in "Electric lighting apparatus," for which I filed an application for letters patent of the United States, December 2d, 1878.

And have also invented certain improvements in electric lamps, for which I also filed an application for letters patent of the United States, December 2, 1878.

And have also invented a certain improved dynamo-electric machine, for which I have prepared an application for letters patent of the United States, dated December 16, 1878.

And have also invented certain other improvements in electric lamps, for which I filed an application for letters patent of the United States November 30th, 1878.

And have also invented a certain improved thermo-lamp, for which I filed an application for letters patent of the United States November 25th, 1878.

And have also invented certain other improvements in electric lighting apparatus, for which I filed an application for letters patent of the United States November 19th, 1878.

And have also invented certain other improvements in electric lamps, for which I filed an application for letters patent of the United States November 19th, 1878.

And whereas, the Electro-Dynamic Light Company, a corporation created and organized under and by virtue of the laws of the State of New York, have purchased of me all my right, title 3507 and interest in and to said inventions, and any and all letters patent of the United States that may be granted for the same, and have paid me therefor the sum of one dollar, and given me other good and sufficient consideration for the same, the receipt of which I hereby acknowledge, and with which I hereby declare myself satisfied, contented and paid.

I, the said William Edward Sawyer, have sold, and do hereby assign, transfer and convey to the said Electro-Dynamic Light Company all my right, title and interest in and to each and all of said inventions; and each and all letters patent which may be granted for said inventions, upon said applications, or any renewals or amendments thereof, for the said company to have, hold and enjoy for its own use and behoof, and the use and behoof of its successors and assigns to the full end of the term for which said letters patent may be granted, and through all the renewals and extensions thereof, and I do hereby authorize and request the Commissioner of Patents to issue said letters patent, applied for as aforesaid, to the Electro-Dynamic Light Company as the assignee of all my right, title and interest in and to the same as aforesaid.

Witness my hand and seal this 9th day of December, 1878.

3510 *Assignment: W. E. Sawyer to Electro-Dynamic Light Co.*

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE.

To all persons to whom these presents shall come, Greeting:

This is to certify that the annexed is a true copy from the records of this office of an assignment from William Edward Sawyer to the Electro-Dynamic Light Company, recorded in Liber Q 24, page 10, and said record has been carefully compared with the original, and is a correct transcript thereof.

In testimony whereof I, E. M. Marble, Commissioner of Patents, have caused the seal of the Patent Office to be affixed this 12th day of December, in the year of our Lord one thousand eight hundred and eighty-two, and of the Independence of the United States the one hundred and seventh.

[SEAL.] E. M. MARBLE,
Commissioner.

Whereas I, William E. Sawyer, of the city, county and State of New York, have invented certain new and useful improvements in electric lamps for which I have applied for letters patent of the United States April 23, 1879; and for which letters patent of the United States was allowed June 28, 1879, as appears by a notice of the Commissioner of Patents dated the day and year last aforesaid.

And, whereas, the Electro-Dynamic Light Company of New York, have purchased of me all my right, title and interest in and to said invention, and in and to the letters patent allowed for the 3511 same as aforesaid; and in and to any and all letters patent of the United States which may be hereafter granted, issued, reissued or extended for said invention, as described in said application for said patent, and has paid me therefor the sum of one dollar, lawful money of the United States, and has given me other good and sufficient considerations for the same, the receipt of which I hereby acknowledge, and with which I hereby declare myself satisfied, contented and paid. I, the said William E. Sawyer, for the consideration aforesaid, do hereby assign, transfer and convey to the said Electro-Dynamic Light Company the whole of my right, title and interest in and to said invention, and any and all letters patent of the United States, which may be hereafter granted, issued, reissued or extended for said invention. For the said company to have, hold and enjoy for its own use and behoof, and the use and behoof of its legal representatives, to the full end of the term for which the same may be granted, issued, reissued or extended, the same as I would have held and enjoyed the same, had this assignment and sale not been made.

And I, the said William E. Sawyer, do hereby covenant, with the said Electro-Dynamic Light Company, that I am now the sole owner of said invention; and to any and all letters patent of the United States which may be granted for the same, and that I have good right and lawful authority to make and execute this conveyance in manner and form as aforesaid.

In witness whereof, I have hereunto set my hand and seal this thirtieth day of July, 1879.

[SEAL.] WILLIAM EDWARD SAWYER.

Witnesses:
AMBROSE E. BEARDSLEY.
WILLIAM L. DURANT.

Recorded, September 1st, 1879. Examined: M. McK.; E. H.

3512 Whereas, William Edward Sawyer, of the city, county and State of New York, and Albon Man, of Brooklyn, in the county of Kings and State of New York, have now obtained certain letters patent of the United States, dated and numbered as follows: Letters patent No. 210,151, dated November 19th, 1878, granted to William Edward Sawyer, as sole inventor, for electric meter; letters patent No. 210,152, dated November 19th, 1878, granted to William Edward Sawyer and Albon Man, as joint inventors, for switch for electric lights; letters patent No. 210,809, dated December 10th, 1878, granted to William Edward Sawyer and Albon Man as joint inventors, for improved electric lamp; letters patent No. 211,262, dated January 7th, 1879, as joint inventors, for carbon for electric lights; and

Whereas, the said William Edward Sawyer and Albon Man have heretofore, by certain instruments in writing, covenanted and agreed with the Electric-Dynamic Light Company, for the consideration therein mentioned, *do* convey to said company the whole of the title to said letters patent and inventions:

Now, therefore, in fulfillment of said agreements and covenants, and for the consideration therein mentioned, and for the further consideration of one dollar to them in hand paid by said company, the receipt of which is hereby acknowledged, and with which the said Sawyer and Man declare themselves satisfied, contented and paid, the said Sawyer and Man do hereby assign, transfer and convey to the said Electro-Dynamic Light Company, a corporation duly created and organized under and by virtue of the laws of the State of New York, the whole of the title to each and all of said letters patent and inventions. The said Sawyer, as sole inventor and owner of patent No. 210,151, and the said Sawyer and Man, as joint inventors and owners of all the rest of said patents, for the whole of the United States and the territories thereof, for the whole of the term for which the said letters patent are granted or may be
3513 granted by reason of any extension or renewal thereof, for the said company, its successors and assigns, to have and to hold for its and their own use and behoof as fully and entirely as the said Sawyer and Man might or could have held and enjoyed the same had this conveyance not been made.

In witness whereof, the said William Edward Sawyer and Albon

Man have hereunto set their hands and seals this the third day of February, 1879.

WILLIAM EDWARD SAWYER.

Oral Testimony in Interference. May 11, 1886. T. G., Ex'r.

CONSOLIDATED ELECTRIC LIGHT CO.
vs. } H, 3553.
EDISON ELECTRIC LIGHT CO. *et al.*

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE.

To all persons to whom these presents shall come, Greeting:

This is to certify that the annexed have been carefully compared with the files of this office and are true copies of certain papers in the matter of the interference Sawyer and Man *vs.* Thomas A. Edison, for improvement in electric lights.

In testimony whereof I, M. V. Montgomery, Commissioner of Patents, have caused the seal of the Patent Office to be [SEAL.] affixed this 22d day of June, in the year of our Lord one thousand eight hundred and eighty-five, and of the Independence of the United States, the one hundred and ninth.

M. V. MONTGOMERY,
Commissioner.

3519 In the United States Patent Office.

SAWYER AND MAN
vs. } Electric Lights.
EDISON.

To Amos Broadnax, Esq., attorney for Sawyer and Man:

Please take notice that, on Friday, April 13, 1883, at 10 o'clock, a. m., at No. 65 Fifth avenue, New York city, I shall proceed to take the testimony of Francis R. Upton, William Holzer and others, as witnesses in behalf of Mr. Edison, in the above-named interference.

The examination will be continued from day to day until completed. You are invited to be present and cross-examine.

RICHARD N. DYER,
For Edison.

Service acknowledged this 10th day of April, 1883.

AMOS BROADNAX,
Per W. H. BROADNAX.

U. S. Patent Office, May 7, 1883.

3520 In the United States Patent Office.

SAWYER AND MAN }
vs. } Interference. Electric Lights.
EDISON. }

In pursuance of the annexed notice, the parties to the above interference attended before me this 14th day of April, 1883, by attorney, as follows: Sawyer and Man by Amos Broadnax, counsel, and Thomas A. Edison by George W. Dyer, Esq., counsel.

By consent the further taking of testimony is postponed until Wednesday, April 18th, at 10 a. m.

WM. H. MEADOWCROFT,
Notary Public, New York Co.

3521 Pursuant to adjournment the taking of testimony was continued the 18th day of April, 1883.

Present: Amos Broadnax, counsel for Sawyer and Man; Geo. W. Dyer, counsel for Edison.

FRANCIS R. UPTON, a witness produced on behalf of Edison, being duly sworn, testifies as follows in answer to questions proposed by GEO. W. DYER, counsel for Edison:

1 Q. You have already testified in this case, haven't you?

A. Yes.

2 Q. Do you know Alexander Welsh, who has testified in this case as a witness for Sawyer and Man?

A. Yes.

3 Q. When did you first become acquainted with him?

A. I first met him in the fall of 1880.

4 Q. Under what circumstances?

A. He was employed in the lamp factory, and I came in contact with him in my visits to that place; the Edison lamp factory at Menlo Park was referred to.

5 Q. How long did Welsh work at the lamp factory at Menlo Park?

A. Until about February, 1882.

6 Q. What was his employment when he first worked at the lamp factory?

A. My impression is he was employed in exhausting the lamps.

7 Q. Do you know how long it was after that, he began to work at carbonizing?

A. He commenced carbonizing about February, 1881.

8 Q. Did he commence then to learn the business of carbonizing?

3522 A. He had some slight acquaintance of the methods used from seeing the process carried on. When he commenced at this time, he was instructed specially in this branch and gave his whole time to it.

9 Q. Were his instructions confined to Mr. Edison's methods of carbonizing?

A. As far as I know they were.

10 Q. Was there any time he was given full charge of the carbonizing, and if so, about what time was that?

A. From the time he was employed in carbonizing until he was discharged, he was given full charge of the carbonizing.

11 Q. Do you remember the time when he was thus employed in the carbonizing?

A. From February, 1881, till February, 1882, is my recollection.

12 Q. Why was Alexander Welsh discharged?

A. Because we had lost confidence in him.

13 Q. For what reason?

A. When he was placed in charge of the carbonizing it was expressly mentioned that he should report experiments truthfully. We were satisfied he was not doing so; this lack of truthfulness had become a by-word in our factory.

14 Q. Since he was discharged what has been his attitude towards the Edison Electric Light Co. and the interests of Mr. Edison?

A. Most of the time active opposition.

15 Q. What instances, if any, can you give of active opposition?

A. It has come to my knowledge several times that he was employed in trying to get workmen in the Edison interests away to other companies.

16 Q. Mr. Welsh in his testimony says that you made promises which you failed to fulfil, which led in consequence to a very bad feeling between us; this was an answer to X Q. 105. Have you anything to say in regard to this statement of Mr. Welsh?

3523 A. I have absolutely no recollection of any unfilled promises to Mr. Welsh. I had no bad feeling towards him, except that I had been provoked by finding out how grossly he had abused the opportunities that were given him.

17 Q. Mr. Welsh says in his redirect testimony, in answer to questions 116 and 117, that he has since been solicited to return to the employ of Mr. Edison by yourself. Have you anything to say as to that?

A. After his discharge from the lamp factory I was desirous of preventing him from carrying information gained by him at the employ of the lamp factory to opposition companies. I recommended him to the superintendent of the Isolated Company as a bright man, at the same time cautioning him regarding his habit of untruthfulness.

18 Q. Do you know Robert White, a witness, who has testified in this case in behalf of Sawyer and Man?

A. I do.

19 Q. Did he work at the lamp factory at Menlo Park, and if so, in what capacity?

A. He worked there as fireman in carbonizing.

20 Q. About what time did he leave the lamp factory and under what circumstances?

A. He was discharged at the same time as Welsh.

21 Q. Why was he discharged?

A. Because we did not think it prudent to discharge Welsh and leave his intimate friend behind.

22 Q. Mr. Welsh testifies that he made certain exhib-s of paper carbon on a morning in July, 1881, between about 7.15 and a quarter to 8, and that it was necessary to complete them at that hour because the train left at eight (8) for New York, and Robert White testifies that you were present during a portion of the time when such exhibits were being made. What recollection have you as to the facts thus testified about?

A. I have no distinct recollection of being present at the time mentioned. I am very positive that there was no train at eight for New York.

3524 24 Q. What hour nearest that time did the train run?

A. At 7.30, within a very few minutes; the next train after was 9.20.

24½ Q. Robert White testifies that in that carbonization you threw water upon the carbonizing box to hasten the cooling of it. What do you say to that statement?

A. I do not recollect doing anything of the kind.

25 Q. He testifies further that you then carried away the specimens of carbonized paper for the purposes, Mr. Welsh informed him, of giving them to Mr. Chas. Batchelor, at the depot. What have you to say to that statement?

A. I can't recollect so doing.

26 Q. Do you remember the fact that at the time Mr. Batchelor testified in this case, in July, 1881, he produced specimens of carbonized paper purporting to have been made in the manner described by Mr. Man and Mr. Sawyer in their previous testimony in this case?

A. I have been informed that he did so.

27 Q. Have you any knowledge or information who made those exhibits produced by Mr. Batchelor, and where they were made and during what time of the day?

A. I have always understood that he (Mr. Batchelor) made them himself, assisted by Mr. Atcheson, the night before he testified regarding them, and that they were made in the laboratory at Menlo Park.

28 Q. Was the laboratory a distinct building from the lamp factory, and, if so, about what distance from it?

A. It was entirely distinct and separated from the lamp factory by a distance of about 1,500 feet. The lamp factory was at the foot of the hill, the laboratory on top. Men employed in one were not allowed in the other, except on business.

3525 29 Q. Were you present during the time when Mr. Alexander Welsh gave his evidence in this case?

A. I was most of the time.

30 Q. Were you present when Alexander Welsh produced and put in evidence samples of carbonized paper purporting to have been made in accordance with descriptions in the former testimony of Mr. Man and Mr. Sawyer?

A. I was.

31 Q. Did you examine such specimens at the time sufficiently to form an opinion upon them?

A. I did.

32 Q. What opinion did you then form of them, as adapted to practical use, in incandescent electric lamps?

A. I formed a very decided opinion that for practical use in incandescent electric lamps they would prove an utter failure. First, in manufacturing lamps the breakage in clamping such loops would be so great as to preclude their use in competition with materials now ordinarily used. Secondly, owing to the irregularity of the carbon they, if it were possible to bring them to incandescence, would be so irregular as to shorten their life very materially. Third, owing to their extreme lack of elasticity it would be almost impossible to transport lamps if such could be made.

33 Q. In the first reason given in the previous answer, what would cause the breakage in clamping, referred to in that answer?

A. In clamping carbons it is necessary to handle them and to hold them firmly. From my experience, I should judge there would be great liability of breakage in either of these operations. The cause of it would be the friable nature of the carbon. I scarcely dared touch the exhibits for fear of breaking them.

FRANCIS R. UPTON.

By consent the further taking of testimony was postponed to Thursday, April 19th, at 10 a. m.

3526 THURSDAY, *April 19th.*

Parties met pursuant to adjournment. Same counsel being present, and PHILIP S. DYER, being duly sworn, is produced as a witness in behalf of Thomas A. Edison, and answers to the questions propounded to him as follows:

1 Q. Please give your name, age, residence and occupation.

A. Name, Philip S. Dyer; age, 26; residence, East Newark, N. J.; employed as book-keeper for the Edison lamp factory.

2 Q. How long have you been in the employ of the Edison lamp factory as book-keeper?

A. Since January 1st, 1881.

3 Q. Do you know Alexander Welsh, who has testified as a witness in this case in behalf of Sawyer and Man?

A. Yes.

4 Q. Was he at any time in the employ of the Edison Lamp Company at Menlo Park?

A. Yes, sir.

5 Q. When did he enter such employ?

A. About October 1st, 1880.

6 Q. When did he take charge of carbonizing?

A. About the latter part of January, 1881.

7 Q. When did he leave the employ of the Edison Lamp Company?

A. Latter part of January, 1882; discharged.

8 Q. Why was he discharged, if you know?

A. Considered untrustworthy and unreliable.

9 Q. Do you know what his reputation for veracity was among the employees of the company?

A. Very bad.

10 Q. Do you know Robert White who testified as a witness in this case for Sawyer and Man?

A. I do.

11 Q. Do you know when he was employed by the Edison Lamp Company at Menlo Park?

A. Yes, sir.

3527 12 Q. What date was it?

A. Middle of April, 1881.

13 Q. When did he leave the employ of the Edison Lamp Company and why?

A. In the latter part of January, 1882; discharged because he was considered unreliable and a friend of Alexander Welsh.

14 Q. What do you know about Mr. Alexander Welsh having attempted to entice away men from the Edison Lamp Company after he had been discharged by them?

A. I know of a conversation he had with one man and know of a telegram he sent to another man, and that man told me Welsh was trying to get him.

Answer objected to as mere hearsay.

Cross-examination by Amos Broadnax, counsel for Sawyer and Man:

15 X Q. What was in the telegram?

A. Welsh wanted this man to meet him at Brooklyn on a certain night.

16 X Q. What was the man's name?

A. Robert McKune.

17 X Q. When was that?

A. I think in the fall of 1882

18 X Q. What time in the fall of 1882 was it?

A. I can't say definitely.

19 X Q. Please to repeat the words of the telegram.

A. As near as I can remember "Meet me in Brooklyn this evening;" I can't remember where the place was.

20 X Q. And you inferred from the language of that telegram that Mr. Welsh was trying to induce the man McKune to leave the employ of the Edison Lamp Company, as I understand it?

3528 A. I inferred that from the telegram after what McKune told me that Welsh had been trying to get him to go over there previous to that time.

21 X Q. What did McKune tell you, please to repeat his words as near as you can?

A. That Welsh had sent word to him several times to meet him.

22 X Q. To meet him for what purpose?

A. Relative to taking a position in the company that Welsh was with.

23 X Q. Did McKune meet him?

A. Not to my knowledge.

24 X Q. How did McKune come to make this statement to you that Welsh was trying to get him to leave the employ of the Edison Lamp Co.?

A. On account of my giving him the telegram, and friendly relations between us, he being about my age. All the telegrams came to my office by telephone.

25 X Q. What was Mr. McKune's duties in the Edison lamp factory?

A. Cutting bamboo fibres for use in the Edison lamp.

26 X Q. Can't you fix the time a little more definitely when you received this telegram for Mr. McKune?

A. No, sir.

27 X Q. Did you ever know Mr. Welsh to tell a falsehood?

A. Yes, sir.

29 X Q. What did he lie about?

A. Everything.

29½ X Q. Lied all the time?

A. Yes, sir; pretty near all the time.

30 X Q. Can't you mention something he lied about?

A. Yes, sir.

31 X Q. Please do so.

A. He lied to me one time about owning a horse. He lied to me several times about his accounts.

32 X Q. Did he swear to these lies, any of them?

A. No, sir.

3529 33 X Q. How do you fix the dates of the time that Mr. Welsh went in the employ of the Edison Lamp Company and the time that he left the employ of that company?

A. From records now in the hands of the Edison Lamp Company.

34 X Q. Do you refer to the time books of the Edison Lamp Co.?

A. Yes, sir.

35 X Q. Who kept those books at the time you say Mr. Welsh went in the employ of that company?

A. The assistant in the office at Menlo Park, John Randolph.

36 X Q. Did you examine that book before you came here to give testimony yourself?

A. I examined that book first when I went in the employ of the Edison Lamp Company in 1881.

37 X Q. When did you last examine it upon this question of fixing time when Mr. Welsh went in the employ of the Edison Lamp Company and when he left that employ?

A. I examined the book last which contains the memorandum of his entering the employ of the Edison Lamp Co. last week, not with any idea of testifying here.

38 X Q. How large is that book?

A. Larger than a sheet of legal-cap paper.

39 X Q. How thick and how much larger?

A. The cover of the book is 9x14, and 1¾ inches thick.

40 X Q. If you can do so, please to produce the book?

A. I do produce the book.

41 X Q. Please to take this book and read from it all the entries you can find in it respecting the time credited to Alexander Welsh.

3530 A. I do so. (Witness reads from page 166.)

Alexander Welsh.

42 X Q. Is that all you find in the book that goes to show the time when Mr. Welsh entered the employ of the Edison Lamp Company, and when he left it?

A. That is all I find in that book to show when he entered the Edison Lamp Company's employ.

43 X Q. How does that account show that Mr. Welsh did not enter the employ of the Edison Lamp Company before October 1st, 1880?

A. The first entry of his name and the first account that we had with him and the first knowledge of a man by the name of Alexander Welsh.

44 X Q. Was this book kept by the Edison Lamp Company or by Thomas A. Edison?

A. Strictly speaking, it was kept by the employees of T. A. Edison, but the Edison Lamp Company paid for the man's services keeping the account.

45 X Q. Do you know of your own knowledge that Alexander Welsh was not in the employ of Thomas A. Edison or the Edison Lamp Company previous to Oct. 1st, 1880?

A. No, sir.

46 X Q. Is your statement that Alexander Welsh went in the employ of the Edison Lamp Company first on October 1st, 1880, based upon the entry in this book you have already quoted?

A. Not wholly.

3531 47 X Q. What other fact or circumstance, is your statement to that fact based upon?

A. Conversations with Welsh and other employees of the Edison Lamp Co.

48 X Q. Please to repeat what conversation you may have had with Mr. Welsh upon that subject.

A. Conversation was general; it was a curiosity to know what time Welsh went to work for the Edison Lamp Company.

49 X Q. Can you swear to anything that Mr. Welsh said that enables you to fix that date?

A. A conversation that I remember having one time with Welsh about the rights of the older employees of the lamp company. Welsh only being there a few months previous to my going there our rights were about equal.

50 X Q. Is that all?

A. Yes; I remember Welsh saying that he was three or four months before I. I also remember Mr. Holzer the superintendent saying so, and others.

Redirect examination by Geo. W. Dyer:

51 R. D. Q. This book that you testified about; what is written on the outside of the book?

A. "Time book."

52 R. D. Q. What is printed on the back of the book?

A. "T. A. Edison."

53 R. D. Q. After you went into the employ of the Edison Lamp Company were regular books first started for that company?

A. Yes, sir.

54 R. D. Q. By whom and under whose directions?

A. By Mr. Wm. Carman under the directions, I suppose, of Mr. Edison. Mr. Carman started the books, and then I kept them afterwards.

55 R. D. Q. Was this account of Mr. Welsh that you have quoted transferred to the company's books?

A. It was.

3532 56 R. D. Q. And charged against the Edison Lamp Company?

A. Yes, sir.

57 R. D. Q. Was that the earliest account in which Mr. Alexander Welsh's name appears on the books of the Edison Lamp Company?

A. Yes, sir.

58 R. D. Q. Do you know how the morning trains from Menlo Park to New York ran in July, 1881?

A. Yes, sir.

59 R. D. Q. What were the hours?

A. 6.65 first; 7.21, 9.21 and 11.21

Recross-examination by Mr. Broadnax:

60 R. X Q. What is printed on the side of this book about which you have testified?

A. "Platina."

PHILIP S. DYER.

(En'd: J. A. W. M. McK.)

3533 State of New York, }
County of New York, } *ss:*

I, J. Edgar Bull, a notary public within and for the county of New York, do hereby certify that the exhibits referred to in the annexed sheets were duly marked by me and were offered in evidence on the 11th day of October, 1882, by George W. Dyer, Esq., on behalf of Thomas A. Edison, that Amos Broadnax, Esq., was present as counsel for Sawyer and Man, that I am not connected by blood or marriage with either of said parties, nor interested directly, or indirectly, in the matter in controversy.

In testimony whereof I have hereunto set my hand [SEAL.] and affixed my seal of office this 16th day of February, 1883.

J. EDGAR BULL,
Notary Public, N. Y. Co., N. Y.

3534 & 3535

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
WASHINGTON, D. C., *June* 2, 1882.

In Re Interference SAWYER AND MAN *v.* EDISON. } Before the Examiner of Interferences.

Subject-matter: Electric lamps or lights.

Sawyer and Man, care of A. Broadnax, 8 and 10 Pine street, N. Y. city;
Thomas A. Edison, care of Geo. W. Dyer, Washington, D. C.:

Please find below a communication from the examiner in charge of interference, in regard to the above-cited case.

An appeal may be taken from the decision of the examiner within twenty days, (see § 4904, Revised Statutes).

Very respectfully,

E. M. MARBLE,
Commissioner of Patents.

3536 Room No. 1.

In the matter of the interference above referred to, upon which a hearing was appointed for the 7th day of May, 1883, the question of priority of invention has been decided in favor of Sawyer and Man.

J. B. CHURCH,
Examiner of Interferences.

(Endorsement: 7768; office to Sawyer and Man and Edison in interference decided in favor of Sawyer and Man June 2, 1883.)

3537 In the United States Patent Office.

SAWYER AND MAN *vs.* EDISON. } Before the Examiner of Interferences.

Application of Sawyer and Man, filed January 9, 1880.

Application of Edison, filed December 11, 1879.

The invention involved in this controversy is:
"The incandescent conductor for an electric lamp, formed of carbonized paper."

A decision was rendered in this case by this tribunal on the 20th of January, 1882, but, on motion in behalf of Edison, accompanied by certain affidavits and other evidence, the Commissioner reopened the case, with leave to take new testimony. The case has now been considered in connection with the testimony before filed and that introduced under the order of the Commissioner.

It appears from testimony on both sides that carbonized paper has certain qualities which are generally considered very desirable, if not indispensable, for an incandescent conductor, but it also has defects which if not cured, cause its destruction in such a brief period as to render it of no practical value in the system of electric lighting. It is found that carbonized paper if used as a conductor in the open air, or in such a vacuum as can be obtained by ordinary apparatus, has a life of only a few minutes. The two parties to this interference have discovered methods of using this paper so as to utilize its desirable qualities and lengthen its life to such an extent as to make a practical operative incandescent electric lamp instead of obtaining mere momentary flashes of light as were given 3538 in their first experiments. For those reasons we do not regard the use of paper carbon abstractly as within the issue, which must be construed to be paper carbon embodied in an operative combination. Though the methods employed for producing this effect are dissimilar in some respects, yet the paper carbon is the basis of the system, and the party who first invented some manner of practically applying the paper carbon so as to adapt it to use is entitled to an award upon the issue involved herein.

Sawyer and Man made experiments in March, 1878, in which paper carbons were used, and perceiving the difficulties, numerous methods of obviating them were resorted to. During that spring the resistance of the paper carbon was made more uniform by treating it with powdered plumbago and with a hydrocarbon vapor or liquid, and oxygen was excluded from the chamber containing the incandescent conductor either by creating a partial vacuum therein or by filling the chamber with a gas (preferably nitrogen).

These experiments were contiuued until the following autumn or winter, and the light of a lamp containing the paper carbon was extended from a few minutes to some hours. Such is the testimony of all the witnesses examined on this point.

It is urged by the opposing party that Sawyer and Man no longer employed a paper carbon, but that it was so modified by the treatment as to become a different composition, and so be removed from the controversy. To this it may be replied that the paper carbon still exhibited its desirable qualities, while its defects were modified to such an extent as to produce a decided improvement in electric lighting. The principle was the same, though the improvements from a failure brought success. A product may receive additions which remove certain of its defects and yet retain the valuable properties and capacities of the original, and then, because it is an improvement, it is none the less within the scope of the basic product. (See Goodyear Dental Vulcanite Company *vs.* Evans, 3 Fisher, page 390.)

3539 Many other considerations besides durability of the incandescent conductor enter into the question of the commercial success of the electric light, and it is not thought necessary to determine in this case whether either of the parties has produced such a light, but simply to ascertain which first employed paper carbon in an operative lamp in such a manner as to demonstrate its practicability as an incandescent conductor. No precise limit of time for the duration of the conductor can be fixed upon, but generally it may be said that an existence of a few moments would not satisfy the conditions required of a conductor, while an existence of some hours would. According to the testimony presented, Sawyer and Man had succeeded in employing paper carbons in such a manner that they lasted some hours at least as early as the autumn of 1878. The life of the carbons varied, but the majority of them burned from five to twenty hours.

It is argued, however, that certain newspaper articles and a book written by Sawyer to show that the experiments conducted by Sawyer and Man were unsuccessful and abandoned. As the case was reopened on account of this evidence, it is deemed advisable to give it special attention. In an article to the New York Herald the following paragraph occurs:

"If you care to settle the question of priority of invention upon the horseshoe lamp as between Mr. Edison and myself, you may inspect one of those lamps which broke down a- No. 94 Walker street about a year ago, and, after many experiments, was so far condemned that Mr. Man and I concluded we would not waste money enough on it to pay for a patent. This lamp is at present just exactly as it was when removed from the bracket, hermetically sealed in a glass globe filled with nitrogen gas, and in just exactly the same condition it was a year ago. To avoid any question I placed said abandoned institution in the hand of Messrs. Arnoux and Hochhausen, number 2 Howard street, yesterday (Monday) morning at nine o'clock."

3540 This letter bears date December 23, 1879. Of the three newspaper articles it is the only one which bears on the question of abandonment by Sawyer and Man. What lamp is this which is referred to?

From the fact that it was made at Walker street, and at about the same time, and with the one now in controversy, the inference is sought to be drawn that it is identical with the one now in question. But it is thought that other facts point more strongly the other way. It is nowhere stated in the article that it was a paper-carbon lamp. The letter says that Sawyer and Man did not think the lamp therein referred to worth patenting, while the testimony of Broadnax shows that they did wish to patent the paper-carbon lamp. As before stated, the letter is dated December 23, 1879, and then refers to that lamp as an abandoned institution, but an application for a patent was executed for the paper-carbon lamp about two weeks thereafter.

The burden of proof is upon Edison to identify the lamp mentioned in the letter with the paper-carbon lamp, but it is not thought he has sustained this point.

In the book introduced in evidence, denominated Electric Lighting, Sawyer, a chapter is devoted to incandescent carbons, and the following sentence occurs:

"The carbonization of live willow twigs, with a view to obtaining a suitable bent carbon by Sawyer and Man, and the carbonization of paper and bamboo by Edison substantially close the account of incandescent carbon."

The book was published in 1881, and Sawyer and Man's application herein involved was before the office. It would be difficult to fathom Sawyer's exact motives in mentioning the fact that Edison had carbonized paper, without at the same time adverting to his own efforts in the same direction. It may be, that knowing 3541 his claim was on file in the Patent Office, he preferred to rest upon that, without publishing it to the world, and by so doing obtain a patent without the expenses of a conflict with rival inventors. Indeed, it seems very plausible that both the letters and the book were intended to throw Edison of his guard, so that Sawyer and Man's patent might be first secured.

At any rate, such an explanation is more consistent with his other acts, and the testimony in the case, than the theory advanced by the other side, that he regarded his former efforts as unsuccessful experiments.

If, however, it be admitted that the articles in the newspapers refer to the paper-carbon lamp, and that Sawyer's derogatory expressions indicate that the experiments made by Sawyer and Man were unsuccessful, and were abandoned, then it becomes necessary to weight this evidence against the other evidence to a contrary effect.

And we find that a large preponderance of the evidence contradicts most positively the implication of abandonment deduced from these publications. Furthermore, it is shown that at the date of these publications, Sawyer was hostile to the company which was working this invention.

After an examination of the entire record, it must be held that Sawyer and Man reduced this invention to practice at least as early as the autumn of 1878.

The testimony in behalf of Edison shows that carbon from paper was made by him in 1876, but it was for other purposes than electric lighting. He, however, seems to have been aware of its quality of high resistance for small surfaces.

Experiments were made by Edison and his assistants relating to incandescent electric lamps in the autumn of 1877 and 1878, and amongst the almost innumerable materials tested it appears that carbonized paper was included. It is in evidence that in the first attempt at making an incandescent lamp Edison wished to put a hard-carbon piece into the globe, but as great difficulty was 3542 experienced in making the carbon small enough, he suggested to his assistant that he should cut the carbon from carbonized paper, of which they had a quantity on hand (Batchelor, answer to Q. 10).

This 1877 test was unsatisfactory, as the carbon could only be made to last a few minutes (Edison answers to X QQ. 104, 163, 153. Batchelor answer to Q. 37).

He then tried boron and silicon, and in 1878 made a second attempt with paper carbons, but this was equally unsatisfactory, as he could not get the paper carbon to stand. He then gave up paper carbon and sought for some more durable material. Platinum was selected, and he testifies that between January, 1879, and the autumn of that year he was "engaged night and day" on experiments with platinum as a conductor (answer to X Q. 242.)

The trouble with the paper carbons was that they would not last, being quickly oxidized in the partial vacuum which he then attained. In the autumn of 1879, however, while experimenting in another direction, he obtained a much more perfect vacuum, and it then occurred to him that perhaps the paper carbon would stand in such a vacuum. Following up this idea, he commenced experiments again with the paper carbon, and they ended in success, as he succeeded in making a lamp which would burn some hours.

The autumn of 1879 may, therefore, be fixed upon as the date of Edison's reduction to practice.

It is quite clear that the former attempts had been discontinued because of unsatisfactory results, and that he had abandoned the idea of employing paper carbons; hence the earlier efforts cannot be regarded save as abortive experiments which are of no avail in this contest.

Indeed, Edison himself stated that it was not until the autumn of 1879 that he reached the conviction that electric lighting could be successfully accomplished by the employment of carbonized paper as a conductor, for it was only then that he learned
3543 what were the proper conditions. (See Edison's answer to X Q. 259.) The earliest date of invention which can be accorded Edison is the autumn of 1879.

In the argument in behalf of Sawyer and Man reference is made to a motion filed before the first hearing for the suppression of certain testimony in behalf Edison, on the ground that it is inconsistent with the preliminary statement as first filed.

Edison was allowed to amend this statement, and the motion to suppress the testimony was denied, after due consideration, and no reason is now seen for changing the former action. It is also contended that the newspaper articles and book are not competent evidence, but whatever opinion this tribunal may have on this point will not be expressed, as the matter is regarded as having been practically passed upon in the decision of the Commissioner reopening the case.

Sawyer and Man must be adjudged to be the prior inventors.

Consolidated Electric Light Co.
vs. } G, 3553.
Edison Electric Light Co. *et al.*

Department of the Interior,
United States Patent Office.

To all persons to whom these presents shall come, Greeting:

This is to certify that the annexed is a true copy from the files of this office of the file-wrapper and contents in the matter of the appeal to the examiners-in-chief of Thomas A. Edison, filed June 21, 1883, number 79851 for improvement in electric lamps.

In testimony whereof, I, M. V. Montgomery, Commissioner of Patents, have caused the seal of the patent office to be affixed, this 19th day of June, in the year of our Lord one thousand eight hundred and eighty-five and of the Independence of the United States the one hundred and ninth.

M. V. MONTGOMERY,
Commissioner.

3547 SAWYER AND MAN *vs.* EDISON. } Interference. Electric Lamps.

Appeal to the examiners-in-chief.

To the Hon. Commissioner of Patents:

In this case, I respectfully appeal to the board of examiners-in-chief, from the decision of the examiner of interferences, who, on June 2, 1883, awarded priority of invention to Sawyer and Man, and assign the following

Reasons of Appeal.

1. The examiner of interferences erred in awarding priority of invention to Sawyer and Man.
2. The examiner of interferences erred in not awarding priority of invention to Edison.
3. He also erred in holding that the "built-up" carbon conductor of Sawyer and Man was the paper-carbon conductor in issue.
4. He also erred in holding that the lamp of Sawyer and Man, referred to in Sawyer's newspaper letters, was not the kind of lamp in issue.
5. He also erred in holding that the statements in Sawyer's book were designedly untrue, and intended to deceive.

An oral hearing is requested.

THOMAS A. EDISON,
By GEO. W. DYER, *Attorney.*

Washington, D. C., June 21, 1883.

(Endorsement: 7985; interference; 1; Sawyer and Man *vs.* Edison; appeal to board; Thomas A. Edison; reasons of appeal; filed June 21, 1883; *In re* Interference Wm. E. Sawyer and A. Man. *vs.* Thomas A. Edison. U. S. Patent Office June 21, 1883.)

3548 Room No. 3.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
WASHINGTON, D. C., *June* 23, 1883.

Thomas A. Edison, care Geo. W. Dyer, attorney, present; Wm. E. Sawyer and A. Man, care Amos Broadnax, attorney, No. 57 Broadway, New York city, N. Y.

SIR: The appeal from decision of the examiner o- interferences in the case of Sawyer and Man *vs.* Edison; subject-matter "electric lamps or lights," will be heard by the examiners-in-chief. at 1 p. m., on Wednesday, July 18, 1883.

Very respectfully,
E. M. MARBLE,
Commissioner of Patents.

(Endorsement: 7985; 2; Wm. E. Sawyer and A. Man. *v.* Thomas A. Edison; "copy" notice of hear——

3549
No. 7985.

United States Patent Office, July 28, 1883.

Before the examiners-in-chief.

On appeal.

In the matter of the interference between the application of William E. Sawyer and Albon Man, filed January 9, 1880, and the application of Thomas A. Edison, filed December 11, 1879.

Improvement in Electric Lamps or Lights.

The matter in contest is embraced in the claim of Edison, as follows:

"The incandescent conductor for an electric lamp formed of carbonized paper."

Edison applied December 11, 1879, and after referring to his former patent for an electric lamp, wherein a filament of carbon is shown enclosed in a glass bulb, and the atmosphere removed, etc., he sets forth his invention to be an improvement in the process of making the carbon, and sets forth the improved character of the carbon so made of paper, and the advantages of its high resistance and small volume, over slight resistance and greater bulk.

His whole specification is devoted to this single paper carbon, and that is made the gist of his claim.

Now let us see when he first conceived of this specific device for this specific object, and see if he followed it up by experiment with reasonable diligence until he reduced it to practice and made his application.

The evidence shows conclusively that he commenced experimenting with paper to form carbon for various uses and purposes, in his electrical labors, experiments and inventions, which are of public notoriety and knowledge, in 1876, and discovered and had full knowledge of its property for great electrical resistance, which would qualify it for the precise purpose for which he afterwards
employed it on his theory set forth in his specification, for
3550 incandescent light. In 1877, he more particularly devoted
his inventive thoughts and labors to producing an electric lamp or light, of the incandescent class, which should be able to "compete with gas, and be a commercial success." Following up his theory, he, amongst other things, employed a paper carbon pure and simple, in a lamp which is now before us, Edison's Exhibit First Incandescent Lamp; he had discovered and knew as well then as now, that to be able to hold this slight filament of high resisting carbon against the destructive effects of the atmosphere in the presence of electricity, he must have as nearly a perfect vacuum as possible. He did the best he could to secure one; and so far succeeded that he was enabled to fully demonstrate the correctness of his theory, and the adaptability and practicability of the paper carbon. He also knew that such carbon would make suitable con-

ductors in incandescent electric lamps (see X Ans. 397, page 140, printed testimony, and Ans. 372–3, page 86).

What he required to perfect, not the carbon, but the lamp, was more perfect means to exhaust the air from the lamp, and a more perfect seal to keep it out when once expelled.

The first came to his hand in a foreign invention, the mercury air pump, with which he could exhaust the lamp to the "millionth of an atmosphere."

The second defect in the lamp he obviated by employing platinum wires fused in the glass which formed nearly a perfect seal. When this was done the lamp was perfected as now patented to him, and the paper carbons that he had formerly invented and reduced to practice in his 1877 lamp, now before us, came into use and have been put into thousands of these lamps and successfully used, without any change, addition or improvement whatever.

So far then as this paper carbon in contest is concerned, Edison conceived of it in 1876, and experimented with it for an electric lamp in 1877, and in September of that year put it to a practical test in a lamp, and afterwards experimented further in 1878, and kept on testing and perfecting his lamp, and fully reduced the perfected thing to practice, and put it on the market, and publicly exhibited it in 1879. 3551

We see no possible ground for charging lack of diligence from conception to complete perfection, and application, and giving to the public.

Certainly Sawyer and Man cannot successfully challenge him, since he came first to the office.

Now, as regards Sawyer and Man. They applied January 9, 1880, and set forth and claimed:

"1. Incandescing arcs for electric lights.
"2. Incandescing arcs of carbon.
"3. Incandescing arcs of carbonized paper.
"4. Incandescing arc of carbonized fibrous or textile material."

In their specification they say that their "improved burner consists in an arch-shape piece of carbon shown as 'A' in their drawing."

They lay no stress at all upon the character of this carbon, except as to this arch form, saying that they have tried carbonized paper covered with powdered plumbago, wood, carbon or charcoal, and ordinary gas carbon.

All was fish coming to their net, any kind of carbon, if in the form of an arch, came within their supposed invention and claims, and certainly the carbonized paper and plumbago was not the "paper carbon" pure and simple of Edison.

A substitute specification was afterwards filed by their attorney, in which is repeated the declaration that their "improvement consists in the employment of an incandescent arc of carbon," etc., and more fully sets forth the "advantages of the arched form," and say they have used such burners in the presence of nitrogen and hydrogen gas in vacuum chambers, etc., and they claim: 3552

1. An incandescing arc, of carbonized fibrous textile material, and of an arch or horseshoe shape.

2. The combination of such a shaped carbon and a transparent, hermetically sealed chamber from which oxygen, etc., are excluded.

3. Like combination with addition of transparent, hermetically sealed chamber, from which oxygen, etc., are excluded.

"4. The combination, substantially as hereinbefore set forth, of an electric circuit, an incandescent arc of carbonized paper included in and forming part of said circuit, and a transparent, hermetically sealed chamber, in which the arc is enclosed."

All of these claims were rejected, except the 4th,—the examiner holding that there was no patentable novelty in the form, etc.

This 4th claim was put in interference with Edison's first.

But there is nothing in their specification to show that they considered themselves the inventors of anything, except this form, as regards paper carbon, they merely say that they have "tried" "paper and plumbago" together with various other substances. They lay no stress at all upon the paper-plumbago carbon as being in any way different or superior to the other carbon tried. They claim any and all carbon in that shape. There is then no good basis in their specification for making any such claim as that made by Edison.

At most they set forth a claim to use paper carbon alternately, and as the equivalent of any other carbon in the specific form, and for the purpose set forth.

3553 Now, when we come to look at their proofs, we find the same thing in regard to their trying paper with other substances in making carbons, and experimenting with electric incandescent lamps.

Everywhere it is the same thing—using paper indiscriminately with other things, such as "fibrous and textile material," embraced in their first claim.

In fact, Sawyer swears that "what Man did not do in the way of carbonizing different things can't be imagined."

There is nothing to show that they considered paper superior to any of the other things. Indeed upon the theory upon which they were working, and in the lamp which they brought forth, it had no special value. It was employed rather as a vehicle to carry the real carbon. It was a skeleton upon which they built up their comparatively large and hard carbon, the thing which they had to "treat" by burning it electrically in the presence of hydrocarbons, to secure a deposit upon it of "hard condensed carbon," suitable for their theory of low resistance and greater quantity of electrical current (Man's testimony, ans. 17 and 18; Church, ans. 39; Wm. E. Sawyer, fol. 268, ans. 5, p. 67, and ans. 6; Church, X ans. 92 and 94, p. 100; Man's, p. 103, folio 411).

Sawyer fully recognizes the difference between Edison's theory, on which he reduced his lamp—having this attenuated paper carbon pure and simple—to practical and commercial success; and the theory upon which he and Man were working, while they tried paper-plumbago carbons treated to secure additional bulk of carbon.

He says: "Mr. Man's idea and mine upon the question of resistance began to differ. That is to say, my theory that the most perfect electric lamp would be one in which the incandescent conductor had the highest resistance and the least transverse mass (the theory on which Edison worked out his invention) was gradually abandoned by myself, while largely retained by Mr. Man; my present theory being that the most perfect electric lamp is
3554 one in which the incandescent conductor has not only the least transverse mass, but the least resistance; I soon began to reduce the resistance of my carbons to as low as an ohm; at present I make them only ¼ ohm, therefore I would treat the carbons so as to obtain a heavy deposit." (X ans. 42), and he adds that "Mr. Man reduced the resistance in his carbons from 50 to 75 per cent. by the treatment referred to." That is the "Sawyer and Man treatment," which was patented to them.

They commenced their experiments with paper and other things in the spring of 1878.

Sawyer says Man took pieces of blotting paper, rubbing and pounding graphite into them until they were full, and carbonized by electrical currents in the presence of illuminating gas. Mr. Man also packed blotting paper in powdered gas-retort carbon, and carbonized in an iron box heated in a range.

These were "treated" in the presence of hydrocarbon and tried in a lamp. The experiment was not satisfactory to Sawyer, at least. He says his own idea was that a "harder carbon would be better than those thin, fragile paper carbons, but Mr. Man preferred the paper," etc.

And the question is asked him by his own attorney, "After you had the paper carbons made, state whether you treated them electrically in the presence of hydrocarbon, for the purpose of consolidating and enlarging them," and he answers, "I did." (See also Man's testimony, ans. 17, p. 7. where he speaks of their thus "perfecting the carbon by a deposit of carbon from the gas," etc., "over the whole carbon," etc.

In regard to these experiments in 1878, Sawyer says, that certain carbons shown in a drawing produced, were "positively used, were sealed up and run; the great trouble with them was when we raised the temperature till we could get a bright light, they would break; for this reason I preferred the harder carbon, we finally made them hard enough by treating them in hydrocarbon gas by the Sawyer-Man process." (Ans. 16.)

3555 "Untreated by the Sawyer-Man process, would last from one second to ten minutes, if run up to a good bright light."

In the fall of 1878, it seems that Mr. Man resumed experiments in making carbons from various substances, Sawyer taking no active part, except in testing them, and then it was that Sawyer says, "What Mr. Man did not do in carbonizing different things, can't be imagined," as before stated, but so far as paper is concerned, Sawyer is asked again by his own attorney, "Please state whether or not you began and perfected the invention of the paper-carbon burners, while you and Mr. Man were at 43 Centre street," and he answers, "Yes, sir." (Q. and ans. 22.) The experiments in Centre street were the same we have been considering.

It seems that some lamps were made in the fall of 1878, or fore part of 1879, on their theory, in which prepared paper carbons treated by the Sawyer-Man process were made to do duty, and that some of them burned 100 hours, but the majority broke in 5 hours, and nineteen-twentieths of them in 20 hours. (Sawyers X ans. 94.)

One of these lamps in its broken condition is made an exhibit, and seems to have had a French carbon treated by such process. (See Man's testimony; p. 103, fol. 411.)

In regard to the treated paper carbon made and used by Sawyer and Man, Mr. Edison in his expert testimony says, in answer to Q. 54, p. 31:

"I do not see that the treating of a paper carbon by a hydrocarbon gas, to deposit hard-carbon, improves the paper carbon. If the paper carbon was originally bad, it will always remain so. If it is coated by a deposit of hard carbon the light is radiated then from a hard carbon and not from a paper carbon. If the paper carbon is to have a deposit of this hard carbon placed over it and within it, it doesn't matter whether the paper carbon is good, 3556 bad or indifferent, or is any other form of carbon, or even a metal. The incandescing conductor of the lamp becomes really and truly a hard-carbon conductor, as the major portion of the current passes through the hard carbon, and all the light is radiated from it. If a paper carbon is dipped in different hydrocarbons several times, and recarbonized each time, a deposit of hard carbon takes place on the surface as well as within the paper. The use of a hydrocarbon for depositing hard carbon by electrical incandescence, is only a method for rendering a useless carbon available in an electric lamp."

And again, ans. 59, he says: "The source of light would be a hard gas carbon and not the paper carbon."

It seems to us from a consideration of all they pretend to disclose in their application to the office, and of the testimony before us, that all that Sawyer and Man ever did in the way of using paper in forming carbon for electric light purposes was as a convenient vehicle to carry this true hard carbon built upon it, as set forth, and it seems to us from their own presentation of the case, that in the way they have used, and propose to use paper carbons, as treated by their patented process, any other carbon, or, as suggested in their specification, any carbon from a "fibrous or textile material" or other substance equally convenient as to form with paper, would do just as well. They do not claim in the specification, nor does it appear in evidence, that they have invented and given to the public anything new and useful in the way of carbons beyond what has already been patented to them as a process for building up.

Indeed, when we come to consider this patent No. 211,262, January 7, 1879, in connection with Sawyer's publications, we shall find ample reasons for this holding.

They made their application for this patent October 15, 1878, right after their experiments, as detailed by Sawyer, and in 3557 their specification they say their invention consists "in electrically heating the illuminating part of an electric lamp while surrounded by a carbon liquid, and a new article of manufacture, consisting of an improved illuminating conductor for electric action; and a novel process of preparing the illuminating part of an electric lamp, consisting of first heating the same by means of the electric current while immersed in a carbon liquid, and of subsequently, when the globe containing it is charged with nitrogen gas, and before the flow of such gas through the lamp has ceased, and before the lamp is sealed, heating its illuminating part by means of the electric current to draw out impurities."

And they set forth *in extenso* the defects of ordinary carbons, and especially dwell upon the "dissociate character of all obtainable carbons," a characteristic specially of paper carbons, and they speak of "gas-retort carbon, and that molded from powdered material," but aver that "neither are suitable for incandescent lights, as they lack hardness, density and homogen-ity."

But treated by their process, these defects are cured and when heated they glow with uniform brilliancy.

And they aver that "they have found a pencil of carbon immersed in hydrocarbon liquid and heated to an extremely high temperature by the voltaic current is not of itself attacked, but decomposing the surrounding matter (?), the carbon of which enters and fills up its pores to an extent impossible, except with matter in a very attenuated state, and deposits a perfectly homogeneous layer, generally of a bright gray color, upon the exterior surface," etc.

"Carbon pencils may be cut from this deposit, or the original pencil with its coating may be used in the lamps."

Not a word is said about paper carbon as possessing any quality making it superior to other carbon for treatment by this process, though it was evident that it was during the experiments 3558 made by them in 1878, as narrated, that they hit upon this process and its results. Beyond this we do not think that they themselves supposed any discovery or invention in relation to carbons for incandescent light was made during their experiments, and this is in perfect keeping with Sawyer's publications put in evidence. See his statements in regard to such patented process, p. 69 of his book on electric lighting, and p. 72, when he concedes to Edison the "carbonizing of paper" and bamboo for incandescent purposes.

As to the effect of these publications by Sawyer, as evidence, the Commissioner of Patents, in his decision upon a motion to open the case to introduce it thus expresses himself:

"On the particular point now under consideration, however, said letters have force. In his letter of December 24, 1879, Sawyer says: 'If you care to settle the question of priority of invention upon the horseshoe lamp, as between Mr. Edison and myself, you may inspect one of those lamps which broke down at No. 94 Walker street, about a year ago, and after many experiments was so far condemned by Mr. Man, and I concluded we would not waste enough money on it to pay for a patent.'

"Again he says: 'To avoid any questions, I placed said abandoned institution in the hands of Messrs. Arnoux and Hochhausen, No. 2 Howard street, yesterday, (Monday) morning at 9 o'clock.' In his letter of January 4th, he says: 'Notwithstanding the assertion that one of Mr. Edison's electric lamps has been running for 240 hours, I still assert, and am prepared to back up my assertion, that Mr. Edison cannot run one of his lamps up to the light of a single gas jet (to be more definite, let us call it twelve candle power) for more than three hours.'

3559 "His letter of January 6, 1880, does not seem to have anything material in it, except to show that it is one of a series of letters written by Sawyer at that time.

"The quotations above given have a tendency, at least, to show whatever has been done by Sawyer and Man prior to the time said letters were written, in relation to the invention herein claimed, was simply experimental, and that their experiments had fallen short of success. Sawyer not only says that their efforts had proven ineffective, and were considered by both himself and Man as worthless, but that the abandoned institution had been placed in the hands of parties where it could be found. In his second letter he very forcibly denies the truthfulness of statements made as to the operativeness of Mr. Edison's lamps. Notwithstanding these letters were written and published as above stated, on the 9th of January, 1880, an application executed by Sawyer and Man, describing and claiming the invention in question, was filed in this office.

"In a work published by Mr. Sawyer, and received at this office on March 12, 1881, Mr. Sawyer says, on page 72: 'The carbonizing of live willow twigs, with a view of obtaining a suitable bent carbon, by Sawyer and Man, and the carbonizing of paper and bamboo by Edison, substantially close the account of incandescent carbons.'

"On page 78 he says: 'The filament originally used by Mr. Edison was prepared by cutting card-board into the desired shape, and carbonizing the same by placing the loops thus formed in layers within an iron box with intervening layers of tissue paper, closing the box to exclude oxygen, and raising the whole to red heat in a furnace.'

"Taking all these statements of Mr. Sawyer together, without further explanation, I am compelled to reach the conclusion
3560 that the experiments made by himself and Man were not successful, and that they did not have the invention complete on December 24, 1879.

"The statements contained in his book seem to ascribe this particular invention to Mr. Edison, although this book was published a year after the application of Sawyer and Man was made."

We find nothing in the testimony touching these experiments and publications to explain away the force of these admissions, and conclude with the Commissioner as to the effect thereof.

An attempt is made on the part of Sawyer and Man to destroy its validity by showing that Sawyer made such publications after he had parted with all interest in this invention, and its reliability, by showing that he was bitterly hostile to Man, and the parties with whom he was associated in the ownership of Sawyer's invention.

We find no satisfactory evidence to show that Sawyer or anybody else supposed that he alone, or with Man, had made any invention "of paper carbon," or that any mention of such invention is to be found in any contract or assignment made by him.

As to the other matter, it is possible that Sawyer had good cause for such feeling, and the fact that he was so hostile may possibly reflect as strongly on one party as the other.

Besides, it does not follow that such feeling would affect the truth and veracity of the party entertaining it, especially on a matter of such open and common notoriety as were the transactions and facts embraced in such publications, all of which were susceptible of being easily controverted if not true.

If, therefore, Mr. Man, or others interested, considered such statements untrue, and their rights injured, it was open to them to at least meet them by counter-statements of what they deemed a more correct setting forth of facts.

3561 But nothing of this kind appears to have been attempted in the lifetime of Mr. Sawyer, but on the contrary, they put him on the stand and made him the principal witness, and gave him credit, and can hardly be permitted to come in now and impeach his credibility, or destroy his character for truth and veracity.

For if we are asked to disbelieve his published statements on account of his hostile feelings, how can we be asked to credit him in his statements of other facts when he is a party to the issue, and presumably interested?

Giving credit, then, to Sawyer and Man for all that they claim of invention in their specification herein, and for all that they aver that they did in the way of experimenting with paper carbon in 1878, and after, and admitting that they made a successful incandescent lamp on their theory in 1879, or even in 1878, in which they used a paper carbon alternately with French and other carbon pencils, treated by their process, and built up and consolidated, and made large and hard, as was deemed essential by them, we find no sufficient evidence to show that they ever conceived of reducing to successful practice the paper carbon pure and simple, set forth and claimed by Edison, and made the subject of this interference.

In fact, from Mr. Sawyer's own testimony, it would appear that such paper carbon would be of little or no value in an incandescent lamp of their construction, and not practicable until "treated" to consolidate and harden.

We must therefore find Edison to be the original and first inventor of the thing in controversy, and find priority in his favor, reversing the decision of the examiner of interferences.

File-wrapper and Contents in the Matter of the Appeal of Sawyer and Man. May 11, 1886. T. G., Ex.

CONSOLIDATED ELECTRIC LIGHT CO.
vs.
EDISON ELECTRIC LIGHT CO. *et al.*
} H, 3553.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE.

To all persons to whom these presents shall come, Greeting:

This is to certify that the annexed is a true copy from the files of this office of the file-wrapper and contents in the matter of the appeal to the Commissioner filed by William Edward Sawyer and Albon Man, August 3, 1883, for improvement in carbon for electric lighting.

In testimony whereof I, M. V. Montgomery, Commissioner of Patents, have caused the seal of the Patent Office to be affixed this 19th day of June, in the year of our Lord one thousand eight hundred and eighty-five, and of the Independence of the United States the one hundred and ninth.

[SEAL.]

M. V. MONTGOMERY,
Commissioner.

3566 New York, *April* 13, 1882.

Honorable Commissioner of Patents, Washington, D. C.

Dear Sir: Having received no acknowledgment of my communication of the other day respecting the pending interference matter between Sawyer and Man and Thomas A. Edison, I repeat that I have affidavits to submit concerning such interference of the most important and fundamental character, and desire to and will forward such affidavits upon receiving the necessary information.

Resp't'y, W. E. SAWYER.

New York, *April* 11, 1882.

Commissioner of Patents, Washington, D. C.

Sir: Before any decision is rendered in reference to the interference case between Sawyer and Man and Thos. A. Edison upon electric lamps under present proceedings, I desire to submit affidavits additional and highly important and fundamental and most importantly influencing this case. Will you please acquaint me when to proceed?

Resp'y, W. E. SAWYER.

Copy.

3567 Department of the Interior,
United States Patent Office,
Washington, D. C., *April* 19, 1882.

In the Matter of the Interference between Sawyer and Man and Edison. } Before the Commissioner.

In reply to your letter of the 13th inst., stating that you desired to file affidavits of the most important character in the above case, you are hereby notified to forward the affidavits referred to immediately.

Respectfully,
(Signed) M. SEATON,
Chief Clerk for Commissioner.

W. E. Sawyer, 61 Broadway, New York city.

(Endorsement: Office to W. E. Sawyer, Edison *v.* Sawyer and Man.)

3568 In the United States Patent Office.

William Edward Sawyer and Albon Man
vs.
Thomas A. Edison.
} Interference—Carbon for Electric Lighting.

In the above-entitled interference on behalf of Sawyer and Man an appeal is hereby taken from the decision of the board of examiners-in-chief, awarding priority of invention to Edison to the honorable Commissioner of Patents in person.

This appeal is taken for the reason that the board of examiners-in-chief erred in awarding priority of invention to Edison and also in not awarding priority of invention to Sawyer and Man.

And for the further reason that said decision is contrary to the evidence and is erroneous in law, and these appellants pray that the honorable Commissioner of Patents will set an early day for the hearing of this appeal and that they may have an oral hearing herein.

I herewith enclose my cheque for twenty dollars, the fee required by law upon this appeal.

Respectfully submitted.

AMOS BROADNAX,
Attorney for Sawyer and Man.

Dated August 2nd, 1883.

Very respectfully, SCHUYLER DURYEE,
Chief Clerk.

Sawyer and Man, care Amos Broadnax, N. Y. city.
Thomas A. Edison, care R. N. Dyer, present.

(Endorsement: Office to Sawyer and Man and Edison; notice of hearing, Aug. 28, 1883.)

3571 (Duplicate.)

Department of the Interior,
United States Patent Office,
Washington, D. C., *Oct.* 8, 1883.

In the Matter of the Interference of
Sawyer and Man
vs.
Edison.
On Appeal to the Commissioner.

Sir: You are hereby informed on the above appeal that the decision of the examiners-in-chief awarding priority of invention to Edison is overruled.

By direction of the Commissioner.

Very respectfully, SCHUYLER DURYEE,
Chief Clerk.

Sawyer and Man, care Amos Broadnax, New York.
Thomas A. Edison, care Geo. W. Dyer, present.

(Endorsement: Office to Sawyer and Man and Edison; notice of Commissioner's decision; Oct. 8, 1883.)

3572 United States Patent Office.

Sawyer and Man
v.
Edison.
Electric Lamps.

Appeal from the examiners-in-chief.

Application of Sawyer and Man filed Jan. 9, 1880.

Application of T. A. Edison filed Dec. 11, 1879.

Mr. A. Broadnax for Sawyer and Man.
Messrs. L. Hill and N. R. Garden of counsel.
Mr. G. W. Dyer for Edison.
Hon. Roscoe Conkling of counsel.

The invention in controversy is defined as follows:

"The incandescent conductor for an electric lamp formed of carbonized paper."

Priority of invention was awarded to Edison by the examiners-in-chief, and from their decision appeal is taken to the Commissioner in person by Sawyer and Man, alleging that said decision is erroneous both in fact and law.

Before proceeding to a consideration of the question of priority of invention, it is necessary that certain other questions should be determined which were referred to by the examiners-in-chief in their decision, and urged by counsel for Edison in their arguments at the hearing.

They are as follows:

First. Are the inventions claimed by the respective parties substantially the same?

Second. Are Sawyer and Man joint inventors of the subject-matter in controversy?

A negative answer to either of these questions would necessarily require a dissolution of the interference. 3573 If the inventions made and claimed by these parties are not substantially the same invention, a decision in favor of either would be of no effect; and if Sawyer and Man are not joint inventors of the subject-matter claimed by them, their application was improperly filed, and there is in fact but one applicant properly before the office claiming the invention.

The application of the respective parties disclose the invention—one specifically and the other in connection with carbons formed of other substances. The interference, therefore, was properly declared, because an interference exists where two applicants are claiming substantially the same invention, and where an applicant claims an invention described and claimed in an unexpired patent. For a proper determination of the first question it will be necessary to examine the record of the case, or at least so much of it as may be necessary to ascertain the inventions claimed by the respective parties. Edison in his application describes his carbon and its manufacture as follows:

"I make use of paper of the desired thickness as free as possible from foreign substances or adulterations and for this purpose I prefer and use bristol-board. With suitable instruments, such as a punch and die, I cut out a narrow strip of this paper, preferably in the form of an elliptical bow or an arc of a circle, the ends of the strip being by preference wider than the other portions.

"A number of these pieces of paper are laid flatwise in the bottom of a mold, preferably of wrought iron, and there is laid on them a light weight in the form of a flat piece of gas-retort carbon or other device that will not be distorted by the heat. If several of these are laid one on the other in the mold a piece of tissue paper is interposed between each one and the next.

"A cover is used to close the mold, and the mold is raised very gradually to a temperature of about six hundred degrees 3574 Fahr. This allows the volatile portions of the paper to pass away, and at the same time the mold retains the paper in its proper shape and the paper is prevented from curling up or becoming distorted, as it would be likely to do if the heat were applied suddenly or the light weight dispensed with.

"The mold is now placed in a furnace and heated almost to a white heat and then removed and allowed to cool gradually. The carbon filaments will be found to be smaller than the card-board blanks, and to be sufficiently strong and flexible for handling. The ends of the carbon are to be secured to the metallic conductors in any convenient manner.

"The carbon filaments prepared as aforesaid are very uniform in their resistance to the electric current, and I make them thin and of a sufficient length to offer a great resistance to the passage of the current."

Sawyer and Man do not describe in their specification the process of making their paper carbon, but refer to a paper carbon, and in their fourth clause specifically claim it. Resort must, therefore, be had to the testimony taken in their behalf to show what their paper carbon is.

Albon Man on this point testified as follows:

"4 Q. State, if you please, how you made the carbons, and of what form they were after they were made.

"A. We made the carbons in two different ways—or three. The first were carbonized by the heat of the electric current, the paper being fastened between two conductors and filled with plumbago in some cases and in some cases with mineral salts. The first experiment was in the open air, subsequent experiments in a reservoir of hydrocarbon gas and probably, although not positively, in a reservoir of hydrogen, also in a reservoir of nitrogen, the reservoir being of glass and sealed up, the metallic conductors to which the 3575 paper was affixed passing through to the interior of the reservoir in which the gases were contained. Another method of manufacture was to place the paper in an iron box in powdered gas carbon, close the box and heat the whole in fire. The form- of the papers were various; some of them simple straight strips of paper, some of them were strips of paper cut into an arch form and inserted edgewise between the metal conductors; some of them were bent in an arch form and inserted flatwise between the conductors. 'A,' in drawing Figs. 1, 2 and 3 of the application for patent, represents the form where the paper was cut into an arch. Where the paper was straight without being cut into arch form it was sometimes tied to the conductors with wire and sometimes inserted in slits in the top of the conductors and packed with powder carbon to make connection with the conductor, sometimes fastened between clamps formed by binding screws passing through the heads of the metal conductors." (Sawyer and Man's Record, pages 3 and 4.)

"12 Q. Please to describe now what, if any, preparation you gave to the paper before carbonizing it.

"A. Before carbonizing the first time we filled the paper sometimes with a solution of white loaf sugar and sometimes with Canada balsam, and after carbonizing the first time we soaked the carbon produced in the solution of loaf sugar sometimes, and sometimes in Canada balsam, and recarbonized it; repeating operation several times in some instances; in other cases we did not treat the paper at all before carbonization; this was in the preparation of the carbon which was made in the furnaces, in the preparation of the carbon made with the electric current, in order to make the paper a conductor we coated it with graphite or plumbago and sometimes soaked it in solutions of different metallic salts and dried it; the latter process did not seem to work well; paper filled with plumbago worked the best." (*Ibid.*, page 5.)

3576 "17 Q. Please to state what further treatment you gave the carbon before you put it into the lamp.

"A. After it was placed between the metal conductors, we put it in a sealed reservoir of hydrocarbon gas or a reservoir through which hydrocarbon gas was passing; the reservoir being of glass so that we could observe what was going on; we then turned on the current of electricity gradually and heated up the carbon while it was in the bath, first to about a good white heat, and afterwards to high incandescence; continuing it so long as to perfect the carbon by rendering it uniform in resistance by deposit of carbon from the gas which went on under these conditions. At the point or points of highest resistance first and subsequently over the whole carbon." (*Ibid.*, page 7.)

Other witnesses called in behalf of Sawyer and Man testified on this point substantially to the same effect.

Edison uses his carbon in a glass bulb from which the air has been exhausted by a pump to the millionth of an atmosphere. Sawyer and Man use their carbon in a similar bulb from which the air has been expelled by the introduction of nitrogen or hydrogen gas. Both carbons are used in substantially the same way and for the same purpose. It is urged in behalf of Edison that because Sawyer and Man treat the paper before it is carbonized, and subject the carbon after it has been formed to the treatment of hydrocarbon gas, as stated by Mr. Man, it is no longer an incandescent conductor for an electric lamp formed of carbonized paper, but a compound conductor, and that the paper carbon is simply a frame work upon which a coating of carbon is deposited, and that the original character of the paper carbon is entirely changed.

On behalf of Sawyer and Man it is urged that notwithstanding the treatment to which the paper and carbon are subjected, the carbon is still one formed of carbonized paper. The only witness who testified understandingly as to the effect which the deposit of carbon had upon the paper carbon, was Mr. Batchelor, a witness called in behalf of Edison.

3577 "158 X Q. What experience, if any, have you had in treating paper carbon electrically in the presence of hydrocarbon gas?

"A. I have had considerable experience in treating carbonized paper used as an incandescent conductor in hydrocarbon vapor in connection with the paper-carbon loops of Edison's electric lamp.

"159 X Q. What effect does such treatment have upon the paper-carbon burner?

"A. It deposits carbon from the hydrocarbon on the surface of the incandescent conductor.

"160 X Q. Doesn't it fill up the interstices and consolidate the carbon, making it finer and more compact?

"A. It probably does fill up the little interstices on the surface, but I do not think it makes the paper carbon any more compact. It adds to that by coating on the surface. I have frequently broken these conductors that have been treated in the vapor of the hydrocarbon, and, under a powerful microscope, have found that the fracture of the paper carbon showed no greater density, and the deposited carbon sticking to it in the shape of small needles stuck endwise on it." (Edison's Record, pages 179 and 180.)

Other witnesses testify as to the manner in which the conductor performs its function after being treated in a hydrocarbon vapor, but not as to the effect which such treatment has upon the paper carbon.

From Mr. Batchelor's statement it will be seen that the paper carbon is not affected by such treatment except by the coating of carbon which it receives. In all other respects it remains the same.

The invention, as claimed, is broadly to the incandescent conductor for an electric lamp, formed of carbonized paper. The claim is without limitation, and was intended to cover, I think, any kind of a conductor for an electric lamp formed of carbonized paper.

3578 Can it be truthfully said that the conductor made and claimed by Sawyer and Man is not a paper carbon? Before its treatment in hydrocarbon vapor it certainly is. Does that treatment change its entire character? Is the desk at which I sit not a wooden desk, because covered with a coating of varnish? Is the paper on which I write not paper, because sizing was used in the manufacture to give it body and finish? Are the doors which lead into this room not wooden doors, because there is a coating of paint on them? The desk and the doors are undoubtedly improved by the coatings of varnish and paint, because made more durable in any atmosphere, and under any conditions, but they are used in the same manner as if the coatings were not on them and are known by the same name.

So with Sawyer and Man's carbon; it is undoubtedly changed somewhat by a coating of carbon deposited thereon; but it is nevertheless, I think, a paper carbon. The carbons when prepared by either of the parties in the manner described by them become incandescent conductors when placed in a lamp from which the oxygen has been removed, either by exhaustion by a pump, or by expulsion by hydrogen or nitrogen gas. Neither will operate unless the oxygen is removed, and both will when it is. In other words, each of the carbons become- an incandescent conductor under substantially the same conditions. They are, therefore, substantially the same, and must be so held. If counsel for Edison considered them otherwise, they should have moved a dissolution of the interference after the testimony was originally concluded, and not a reopening of the case for the taking of further testimony.

At all events such motion should have been made before the case was fully submitted on the merits a second time to the examiner of interferences for decision on the question of priority of invention. The idea that the invention claimed by Sawyer and Man does not fall within the issue was clearly an afterthought conceived after the decision by the examiner of interferences on the question of priority in favor of Sawyer and Man.

3579 In relation to the second question Sawyer testifies that he first suggested the making of carbons from paper. Man testifies that he does not know whether Sawyer or himself first suggested it. The first experiment following the suggestion by whomsoever made was an attempt to pass an electric current through a piece of paper which had been marked with a lead pencil. That experiment was not attended with much success, but subsequently it was found that by rubbing the paper with plumbago the current could be passed through and the paper carbonized. Carbonization of paper, however, was not new, and hence whether it was carbonized in that or any other way, so far as this issue is concerned, is immaterial.

After the experiments of Sawyer and Man to carbonize paper by electric currents, the plan was adopted and subsequently followed, which is set forth in the testimony of Mr. Man above quoted.

In their efforts to carbonize paper, the testimony of Man and Sawyer, as well as other witnesses, shows that both the parties were engaged in devising ways and means to secure a perfect carbon from paper, very likely each of them made suggestions which were adopted; they were working together for a common end and object, viz: the carbonization of paper, which was finally accomplished in the manner described by Mr. Man.

Where two or more parties thus unite their efforts to accomplish a particular object, and by such efforts that object is secured, I think it must be held that the product obtained, if any is obtained, is the joint product of both. There is no doubt in my mind that Sawyer and Man should be considered joint inventors of the incandescent conductor made by them.

The case, therefore, recurs on the question of priority of invention.

From the testimony it appears that Edison, in 1876, made certain experiments in the carbonization of paper and in determining the resistance of such carbons.

3580 The history of Edison's experiments in electric lighting by incandescent paper carbon is fully and succinctly stated by Mr. Batchelor, a witness called in his behalf, who testified that he had had general charge of all of Edison's experiments during the last eight or nine years. His testimony is as follows:

"37 Q. Please to give a summary, in a connected way, mentioning dates, as far as possible, of the progress of the invention of incandescent conductors for electric lights made of carbonized paper, from the beginning up to the completion of the commercial lamp."

"A. The history of electric lighting by incandescence with paper carbon by Mr. Edison, so far as I know it, is as follows: In the summer of 1877 he used strips of paper carbonized as an incandescent conductor *in vacuo*, and the lamp in which they were used is now in evidence, and marked 'Exhibit Edison's First Incandescent Lamp.' I should have said here that I remember Edison, within a day or two previous to this lamp being made, using carbonized paper as an incandescent conductor between two electrodes of a battery, but in the open air. The next experiment, or series of experiments, that I call to mind are the ones which I have before spoken of as being made in August or September, 1878. At this time my whole time and attention began to be devoted to develop-

ment of his system of incandescent electric lighting. These paper carbons were made by coating thin papers with lamp-black and tar and rolling up tightly into a rod, drying and carbonizing the same in a suitable furnace. Some of these paper carbons were put in between the two electrodes in an electric circuit, and raised to incandescence in a vacuum. At this time carbons made of paper were not the only things that we tried as incandescent conductors in a vacuum. We made experiments with hard carbons, wood
3581 carbons, and some metal, such as platinum, nickel and iron.

It had early been decided by Mr. Edison that the requisite material for his incandescent lamp should have a great resistance combined with the least possible surface, and I remember well that at this time and previous we used to expect that we should be able to get a substance for an incandescent conductor that would give us at least 500 ohms resistance. The result of this latter series of experiments *in vacuo* had shown us that in order to get a high-resistance lamp from carbon in any form it would have to be cut in an exceedingly fine filament. The paper carbons which we tried were larger than we should have to use if we wanted a higher resistance. With the vacuum we then got, and which we considered at that time to be good, the carbons lasted at the most from ten to fifteen minutes in a state of incandescence. The experiments on platinum led us to hope that it might be easier to get a high resistance from that metal than from carbon. From the date of the finishing of these experiments, which, I believe, was toward the latter end of October, '78, Mr. Edison turned his attention to lamps in which the incandescent conductors were formed of metal and alloys of metal. During the last part of the year '78, and up to October, 1879, I made, at Mr. Edison's request, a very large number of lamps having platinum and platinum-iriduum composing the incandescent conductor. A great many of these lamps had their conductors coated with insulating material in order to be able to wind them up close and get them into as small a space as possible, in order to offer the least radiating surface. Mr. Edison very frequently sat down at my table and worked for hours helping me on these experiments. Our conversation frequently was directed to getting the highest resistance in the least possible space. I remember once or twice during these conversations, early in 1879, he remarked how easy it would be to
3582 get this resistance if carbon were only stable. During the time that I was experimenting on these lamps he had been very busy experimenting to perfect the different apparatus composing his electric lighting system as a whole. I had also worked on these matters, but as our lamp was an exceedingly difficult job the majority of my time, both night and day, with the exception of a week or two in which I devoted some time to telephones, was spent on the lamp. He had succeeded in making a more perfect dynamo machine In testing the lamps with platinum conductors he had been continually improving the apparatus for exhausting the globes. In October, 1879, when he had got a very perfect vacuum for his lamp, he suggested the use again of carbonized paper as a conductor,

and accordingly he had me cut a fine filament of paper which we carbonized and put in a globe. This filament, I believe, was cut straight from paper and bent round previous to putting in the carbonizing chamber. I do not remember what we did with this lamp afterward. But within a day or so of that I cut a loop from paper similar in shape to the one now in Edison's commercial incandescent electric lamp. At the same time that these were being tried I also made lamps of loops of carbonized thread, carbonized flax, fine filaments of lamp-black and tar rolled up and baked, and also threads which had been treated with lamp-black and tar previous to carbonization. All these things we used about the same time as incandescent conductors in electric lamps, the most satisfactory at the time being the carbonized-paper loop which I had cut by hand. We immediately after this made a steel mould in which these loops could be cut quickly, and after a few experiments in the carbonization of them, in order to get their resistance as near as possible alike after carbonization, we made a number of these filaments and used them at an exhibition in Mr. Edison's house, about the second or third of December, 1879. When the first 3583 lamp was made, which had a fine filamentary carbonized-paper conductor from which the light was given, which was about October 22, 1879, then I believe we had a system of electric lighting that was complete and could compete with gas, and we proceeded as expeditiously as possible to exhibit it as such." (Edison's Record, p. 153.)

Mr. Edison testifies to his experiments in the carbonization of paper in 1876, to his experiments in 1877, with the lamp known as Edison's First Incandescent Lamp, to his experiments in 1878, when paper carbons were laid aside, and to his later experiments in 1879, in substance the same as Mr. Batchelor. On direct examination he was asked (Edison's Record, p. 12):

"24 Q. When did you produce electric lamps with incandescent paper carbon conductors in vacuum bulbs hermetically closed, so as to be a commercially complete lamp, capable of entering into competition with gas light?

"A. I made such a lamp about October 22, 1879, which had the characteristics of high resistance, small radiating surface, and sufficient stability and economy to allow of competition with gas."

On cross-examination he testifies as follows:

"259 X Q. State, if you please, when it was that you first reached the conviction that electric lighting could be successfully accomplished by carbonized paper *in vacuo*.

"A. In September or October, 1879; that it could be accomplished by the use of carbonized paper in high and stable *vacuo*, which were the proper conditions. (*Ibid.*, p. 66.)

"396 X Q. When did you ascertain whether or not the conductor could be made small enough and burn under the proper conditions?

"A. I ascertained and obtained the proper conditions to allow of the conductor being made small enough some time in October, 1879. This was when it was placed in high vacuum." 3584 (*Ibid.*, p. 140.)

October, 1879, therefore, must be taken as the earliest date upon which Edison can be said to have had this invention. The invention in controversy is not simply a paper carbon, but an incandescent conductor for an electric lamp, resulting from the use of a paper carbon under certain conditions. The conditions under which he could use such a carbon for that purpose, according to his own statements, and those of the witnesses who had general supervision and management of all his experiments in electric lighting, but did not ascertain until that time.

Sawyer and Man, as appears from the testimony commenced their experiments in electric lighting at No. 43 Centre street, in the city of New York, some time in February, 1878; their operations were continued at that place until the latter part of May, or first June, of the same year. At about the latter date they removed to the corner of Centre and Howard streets, where their operations were continued until the latter part of September of that year; from thence they removed to No. 94 Walker street, near the corner of Elm, where their operations were continued from that time until the following May. Their experiments and demonstrations covered a period of about fifteen months.

Albon Man, one of the parties to this record, testifies as follows:

"13 Q. State, if you please, when it was that you first used the carbon burners you have been describing in the sealed electric lamp.

"A. In March, 1878.

"14 Q. Can you state at what time in March, 1878?

"A. Between the 1st and 15th; I can't give the date." (Sawyer and Man's Record, p. 6.)

"18 Q. Please to state what part or parts of the invention and experiments were made, of which you have been testifying, previous to the 15th of March, 1878, and state what was done after
3585 that, and down to the months of October or November, 1878,
in the order as near as you can, of its being done?

"A. We prepared the paper carbon, first electrically, and subsequently by carbonization in the furnace, in March, 1878; and from that time on to May continued our experiments with it, we treated it during this period in the hydrocarbon bath, improved it by soaking in sugar, etc., and recarbonization. In September, 1878, we commenced the use of the oils, in connection with the electric current, in the preparation of carbon. In October, 1878, we carbonized the complete paper circles or washers, and also straight pencils of paper, with better success than before, that is, having better appliances for the work. I think the first lamps we exhibited with paper were in October, 1878; we had others before that, but did not exhibit them; we first had an electric lamp fitted with a carbon burner, made of paper, in March, 1878." (*Ibid*, p. 8.)

Referring to the experiments made by Sawyer and Man at their rooms on Centre street, Mr. Man testifies as follows:

"74^8 X Q. What was the most satisfactory experiment you made at that place?

"A. With paper carbonized in the furnace.

“ 74^9 X Q. How long did the carbonized-paper conductor last in this experiment?

“A. Until we took down the lamps, taking the carbon out practically uninjured. I can't say exactly how long. We were trying everything we could think of at that time. We ran the lamps for a time, and took them down to examine the carbon to see the effect, and to see if we had got the lamps sealed; we took them down often—daily, or every two or three days.

“ 75 X Q. What was the form of paper carbon in this instance?

“A. That of a flat arch.” (*Ibid.*, pp. 18 and 19.)

3586 “ 83 X Q. What kind of paper was that carbon conductor made from?

“A. White blotting paper.

“ 84 X Q. Single, or of several thicknesses?

“A. I should think several thicknesses pressed together.

“ 85 X Q. Was that conductor coated with powdered carbon?

“A. No, sir; the paper was carbonized in box in furnace; was thicker after carbonization than we wanted; was worked down with emery paper after being worked in shape with knife and filing. This refers to paper shaped after carbonization. The burners shaped before carbonization were simply cut in shape with knife or scissors, and were ready for use after carbonization except rubbing them down on the emery paper.

“ 86 X Q. Do you remember positively this carbon conductor was in a state of incandescence for fifteen minutes?

“A. Yes, I should think for a couple of hours at a time (*ibid.*, page 20).

“ 49 X Q. How many lamps were you in the habit of running upon the same circuit?

“A. Largest number I think was eight. Usually ran but one.

“ 50 X Q. How long did you ever run eight lights continuously at that shop?

“A. I should think probably a week.

“ 51 X Q. Night and day right along?

“A. No, we ran none continuously for a week; but ran them for several hours continuously; we were troubled for power (*ibid.*, page 13):

“ 113 R. D. Q. State, if you recollect, how long you continued a paper carbonized burner in a state of incandescence at any one time.

“A. All day, and until late in the evening. This at the corner of Walker and Elm.

3587 “ 114 R. D. Q. And what its condition when you turned off the current?

“A. Same as when we put it on, except possibly improved.

“ 115 R. D. Q. When was that?

“A. That particular one I should say was in the month of December, 1878.

“ 116 R. D. Q. And was that carbonized-paper burner made in the same way that those were made at No. 43 Centre street?

“A. Yes, same as that in which some were made at No. 43 Centre street. There were other trials much before this, in October, but we only ran them during the day (*ibid.*, page 24)."

William H. Church, a witness sworn in behalf of Sawyer and Man, testifies as follows:

"41 Q. Please to state when it was that you first saw the paper carbons used in the lamp—not experimentally, but in the lamp as perfected.

"A. In Sept., 1878 (*ibid.*, page 31).

"1 X Q. I call your attention to the lamps referred to in your 41st and 42d answers, being the lamps you say you saw perfected and in use in September, 1878, from that time on during the winter. How many different lamps did you see at that time at the places named?

"A. Quite a number; it would be difficult to give the number of separate distinct lamps; sometimes the same lamp was taken down and put up again and again; but for a guess I should say 25 or 30 probably. But this is a guess.

"2 X Q. How many different lamps can you state from recollection that you saw at that time at the places named?

"A. They put up one lot of lamps in which there were six or eight
of a kind. Then another lot varying from that of about as
3588 many more or perhaps a dozen. Then still another form of
as many more, say a dozen. Each of these lamps—some at
least—were taken down and refilled again, or perhaps two or three times, to observe their working. There was still another kind I think of, being four different lots. But the last did not have a paper carbon, but a straight pencil. Mr. Sawyer called it the feeder lamp." (*Ibid.*, pp. 31 and 32.)

"43 X Q. How many lamps did you see in circuit run by this 4-horse-power engine?

"A. I should think 6; might have been 7 or 8. Don't think more than 7 or 8. Have watched 6 lights very often.

"44 X Q. How long did you see these 6 lights burning continuously at one time?

"A. Two hours and a half. Usually watched them about an hour. Seen the current turned in gradually from the light of a very small taper up to a full incandescent light—the best incandescent light, by all odds, I have ever seen. * * *

"46 X Q. Do you know when this type of lamps was produced?

"A. My wife was taken ill last November, and died 11th of December (1878); it was after the 16th of December I came to New York. Then I think I saw this lamp for the first time.

"48 X Q. How many of these lamps did you see in a circuit together?

"A. About the same number, *i. e.*, about half a dozen, more or less." (*Ibid.* pp. 38 and 39.)

William Sawyer, a witness called on behalf of Sawyer and Man, testifies as follows:

"51 Q. State how long you saw any one of the carbons made of carbonized paper illuminating continuously at the corner of Walker and Elm streets, as near as you can recollect?

3589 "A. My answer is about as before. We ran them from day to day.

"52 Q. Did you take occasion to examine them after they had thus been illuminated?

"A. Yes; some seemed as perfect as when they went in, others were fractured.

"53 Q. How many lamps did you have in circuit in Elm and Walker?

"A. The highest number I think was eight.

"57 Q. State, if you know, how many of those lamps were filled with carbonized-paper burners?

"A. Can't say positively, but think all were furnished with such burners.

"58 Q. Did you put carbonized-paper burners in the lamps yourself?

"A. Yes.

"59 Q. In Centre as well as Walker street?

"A. Yes; I made them all." (*Ibid.* pp. 49 and 50.)

William E. Sawyer, one of the parties to this record, testifies as follows:

"3 Q. The subject-matter of this interference as given by the Patent Office is: the incandescent conductor for an electric lamp formed of carbonized paper; please state whether or not you, in conjunction with Albon Man, have at any time made and used such a conductor?

"A. We have a great many times.

"4 Q. State, as near as you can recollect, when it was that you and Mr. Man made such a conductor?

"A. Almost immediately after we went to 43 Centre street; should think about 6th or 7th March, 1878; might have been a little earlier or later.

"18 Q. State as near as you can recollect, how long the best of the carbon papers you made at 43 Centre street would last in the lamp when raised to a temperature high enough to give a good, bright light, after having been treated by the Sawyer-Man process?

3590 "A. Run at a power of about 25 candles they would last from 5 to 100 hours; once in a while we would get a lamp so perfect in every respect that it would seem to undergo no change after a long use; but generally they would fracture in from 5 to 20 hours run at that temperature; the difference in the duration of the burners was due to both imperfections in the lamp and in the carbon; where the fracture alone occurs it must be due either to imperfection in the carbon, or the effect of unequal expansions; when consumption occurs it is due to the imperfect charging of the lamp." (*Ibid.* pp. 65 and 70.)

I have thus given sufficient of the testimony of the respective parties to this contest to show what they did respectively, and when they did it.

Edison completed the invention and reduced it to practice on or about October 22, 1879. Sawyer and Man had the invention in a rude form as early as March, 1878, and completed as early as September or October of the same year. The question here is not when was the invention so completed as to compete commercially with gas, but when was it completed as an operating invention?

It may be that it will never prove to be equal to gas commercially, but that will not prove it is not a complete and perfected invention. An invention is complete when the thought conceived is embodied in some practical and operative form.

It may never prove to be profitsble because of other ways devised for accomplishing the same end. This invention was complete in a legal sense when either of the parties to this controversy had devised means by which to demonstrate its practicability. This was done, not when they with a conductor formed of carbonized paper had produced a light which would continue for a few minutes, but when they with such conductor had produced one which would last for hours, days and even weeks. Such a light with such conductor was first produced by Sawyer and Man.

3591 It was sought to be shown on the part of Edison that all that was done by Sawyer and Man amounted to no more than experiments leading toward a completed invention, but never reaching the goal, and that such experiments were afterward abandoned. In support of this proposition attention was called to certain letters alleged to have been written by Mr. Sawyer and published in the New York Herald, and also to a book put forth under his name and shown to have been written by him. If it had not been conclusively shown that Sawyer and Man had perfected their invention and reduced it to practice more than a year prior to the time either of these letters were written, and more than two years before the book was published, some weight might be attached them, but such proof having been adduced, the publications, in any view which might be taken of them amount to nothing.

When this case was before me in July, 1882, on a motion to reopen it to take further testimony, I stated in my decision—"Taking all the statements of Mr. Sawyer together without further explanation—I am compelled to reach the conclusion that the experiments made by himself and Man were not successful, and that they did not have the invention complete on December 24, 1879." On a full and careful reading of the testimony the "further explanation" mentioned has been fully supplied. Before the writing of these letters and publications the invention of Sawyer and Man had passed beyond the tentative domain of experiment, and had reached the solid ground of completion by practical demonstration. If it be conceded, therefore, that Mr. Sawyer wrote the letters attributed to him, and published the book put forth in his name, they cannot be allowed, either singly or together, to work an abandonment of the invention of Sawyer and Man. This invention was the product of their joint efforts, and could not be abandoned by either separately and alone. Mr. Sawyer could not by any act or by
3592 any word prejudice the rights of Mr. Man without the consent of the latter. I do not think, however, that it was the intention of Mr. Sawyer to abandon the invention, but, feeling

piqued and annoyed by the success of Mr. Edison, he published his letters for the purpose of calling attention to his own and the joint inventions of Sawyer and Man. At the time said letters were written and the book published he was inimical to the owners of this invention, and his habits for sobriety were not good, to say the least. Under such conditions it is not strange he should have written and published what under other *other* circumstances he would not have uttered.

In view of the facts disclosed in the testimony regularly taken in this case, I do not consider any of the statement made by him in his letter or book of any importance, and hence dismissed them from consideration. Neither do I consider, for the foregoing reasons, the question of where the title of the invention was of the time said letters were published of any moment of the decision in this case. The question here is not as to who at that time or now owns the invention of either of the parties, but which of the parties to this record first made the invention. I think it is fully and clearly shown that Sawyer and Man were the first inventors of the "incandescent conductor for an electric lamp formed of carbonized paper."

The decision of the examiners-in-chief awarding priority of invention to Edison is therefore overruled, and priority of invention of the matter in controversy is awarded to Sawyer and Man.

E. M. MARBLE,
Commissioner.

October 8, 1883.

(Endorsement: U. S. Patent Office; Commissioner's decision; Sawyer and Man *vs.* Edison; October 8, 1883; recorded vol. 25, page 41.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
WASHINGTON, D. C., *Oct.* 19, 1883.

In the Matter of the Interference of SAWYER AND MAN *vs.* EDISON. } Appeal to the Secretary of the Interior.

SIR: In compliance with rule 2 of the rules governing appeals to the Secretary of the Interior, you are hereby informed that the Commissioner has submitted his report to the Secretary in answer to the appeal of Thomas A. Edison.

By direction of the Commissioner.

Very respectfully, SCHUYLER DURYEE,
Chief Clerk.

T. A. Edison, care Geo. W. Dyer, present; Sawyer and Man, care Amos Broadnax, No. 8 Pine St., N. Y. city.

(Endorsement: Office to Sawyer and Man *vs.* Edison; notice of Commissioner's report to Secretary; Oct. 19, 1883.)

3594 Interference.

SAWYER AND MAN
vs.
EDISON.
} Electric Lamps.

Before the honorable Secretary of the Interior.

Brief for Edison in Support of His Appeal.

In this case reliance will be had upon the arguments submitted in behalf of Edison before the Commissioner of Patents, which arguments will be found in the printed briefs of Hon. Roscoe Conkling and of George W. Dyer filed herewith and made a part of this brief.

These arguments will also be relied upon as to the errors in law and fact in the decision of the Commissioner, and set out in this appeal herewith submitted.

ROSCOE CONKLING,
GEORGE W. DYER,
For Edison.

October 29, 1883.

3595 *Copy of Appeal.*

Interference.

SAWYER AND MAN
v.
EDISON.
} Electric Lamps.

To the honorable Secretary of the Interior:

In the above-entitled interference I respectfully appeal to your honor *for* the decision of the Commissioner of Patents, who on October 8, 1883, awarded priority of invention to Sawyer and Man, and assign*ed* the following:

Reasons of Appeal.

The Commissioner erred in the following particulars:

As to Matter of Law.

1. In determining that if the inventions claimed by the respective parties are not "substantially the same," or if Sawyer and Man are not joint inventors, then the interference must necessarily be dissolved.

2. In determining that the conductors of the respective parties were "substantially the same" because both employed paper, and both papers were adapted for use in incandescent electric lamps, without taking into consideration the other essentials which in law enter into the comparison of two things asserted to be "substantially the same," viz., a similarity in the mode of operation, and in the result attained.

3596 Having found that Sawyer first suggested the use of paper for carbons for incandescent lamps, and that both Sawyer and Man participated in subsequent experiments in treating the paper after it was carbonized.

3. In determining that under such circumstances Sawyer and Man were joint inventors of carbon conductors made of paper.

Having found that Edison had made and used paper-carbon conductors for electric lamps, and had decided that carbon had the requisite qualities of high resistance and small mass necessary to develop his theory.

4. In determining that Edison did not, in fact, invent his paper-carbon conductors until such time subsequently, as he had ascertained from experiment the best size for his filaments, and had devised a better mode of creating a vacuum in his lamps.

5. In determining that Sawyer and Man did not make the invention when their lamp had a life of a few minutes, but did make it when their lamp had a life of a few hours.

6. In determining that the letters and book of Sawyer were not proof of an abandonment of the invention of Sawyer and Man, because there was proof that Sawyer and Man had completed the invention before the letters were written.

7. In determining in effect that one of the two joint inventors cannot abandon the common invention by public declarations known to and uncontradicted by the other inventor.

As to Matter of Fact.

The case finding on uncontradicted testimony that the paper conductors of Edison had a resistance of one hundred ohms, and those of Sawyer and Man a resistance of one-fourth of an ohm.

3597 1. In determining that these conductors were "substantially alike."

The case finding that Edison's conductors were simply carbonized paper, where the paper gave the high electrical resistance and the consequent light, and Sawyer and Man's conductors were paper carbons built up by hydrocarbon deposits, where the deposits alone caused the low resistance and alone gave the light.

2. In determining that these two conductors were "substantially alike."

3. In determining from the proofs that Sawyer and Man invented paper-carbon conductors for incandescent lamps in 1878.

4. In determining from the proofs that Edison invented paper-carbon conductors for incandescent lamps in 1879.

5. In determining that Sawyer and Man's paper carbons were perfected inventions.

6. In awarding priority of invention to Sawyer and Man contrary to the proofs in the case.

7. In not awarding priority of invention to Edison, in accordance with the proofs in the case.

In view of the pecuniary interests involved in this appeal the Secretary is respectfully requested to grant an oral hearing.

THOS. A. EDISON,
By GEO. W. DYER.

ROSCOE CONKLING.

Washington, D. C., October 17, 1883.

J. K. McC.

3598

DEPARTMENT OF THE INTERIOR,
WASHINGTON, *November 19th*, 1884.

The Commissioner of Patents.

SIR: In accordance with the principle established by the recent decision of the U. S. Supreme Court in Butterworth, Commissioner of Patents, *v.* The United States *ex rel.* Hoe *et al.*, the appeal of Thomas A. Edison to the Secretary, from the decision of the Commissioner of Patents, awarding priority of invention to Sawyer and Man, in the case of Sawyer and Man *vs.* Edison, is hereby dismissed for want of jurisdiction on the part of the Secretary of the Interior to hear and determine such appeal.

The papers in the case belonging to the files of your office are herewith returned.

Very respectfully, H. M. TELLER, *Secretary.*

(Endorsed: $\frac{588}{160}$; office of receiver; Com'r of Patents, Nov. 20, 1884; Sawyer and Man *vs.* Edison; Secretary's decision dated Nov. 19, 1884; recorded page 101.)

3599 (Duplicate.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
WASHINGTON, D. C., *Nov.* 24, 1884.

In the Matter of the Interference of SAWYER AND MAN *vs.* EDISON. } Appeal to the Secretary of the Interior.

SIR: You are hereby informed that the above appeal has been dismissed for want of jurisdiction on the part of the Secretary of the Interior to hear and determine such appeal.

By direction of the Commissioner.

Very respectfully, SCHUYLER DURYEE,
Chief Clerk.

Sawyer and Man, care Amos Broadnax, 10 Pine street, New York city; Thomas A. Edison, care Geo. W. Dyer, present.

(Endorsed: Sawyer and Man *vs.* Edison; notice of Secretary's decision; Nov. 24, 1884.)

3600 Interference.

SAWYER AND MAN
vs.
EDISON.
} Electric Lamps.

To the honorable Commissioner of Patents:

In the above interference, I move for a rehearing before your honor, and for a stay of issue of patent to Sawyer and Man during the pendency of this motion, and ask that your honor fix an early day for the hearing, and assign the following

Reasons in Support of Motion.

In this interference, priority of invention was awarded to Sawyer and Man by the examiner of interferences, and on appeal priority of invention was awarded to Edison by the board of examiners-in-chief, and on further appeal priority of invention was awarded to Sawyer and Man by the Commissioner.

An appeal was then taken by Edison to the Hon. Secretary of the Interior, and was fully argued before him.

He made no decision thereon in consequence of the mandamus proceedings in Gill *vs.* Scott which followed directly afterwards. The Secretary has now dismissed the appeal for want of jurisdiction, under the recent decision of the Supreme Court of the United States in Butterworth, Commissioner, *vs.* United States *ex rel.* Hoe *et al.*, so that all the papers are now before your honor.

After the decision of the Hon. Commissioner of Patents in this interference, Edison did not move for a rehearing and exhaust his remedies before the Commissioner because as the law was 3601 then construed a direct appeal lay to the Secretary which was accordingly taken, and Edison ought not thereby to be deprived of the benefit which would have resulted from a motion for rehearing by the fact that the Secretary had misconstrued the law.

The specific errors of the Commissioner are stated in the reasons of appeal, and the post-cript hereto appended, and reliance will be had upon these reasons in addition to those before presented.

GEO. W. DYER,
For Edison.

Mr. Amos Broadnax, attorney for Sawyer and Man, New York:

Take notice that the above motion will be filed on Monday, November 24, 1884, and heard at such a date as may be determined by the Hon. Commissioner of Patents.

GEO. W. DYER,
For Edison.

(Endorsed: Sawyer and Man *vs.* Edison; motion by Edison; U. S. Patent Office, Nov. 24, 1884. A copy of the within papers served on me 22d of Nov., 1884. Amos Broadnax, for Sawyer and Man.)

3602

Reasons of Appeal.

The Commissioner erred in the following particulars:

As to Matter of Law.

1. In determining that if the inventions claimed by the respective parties, are not "substantially the same," or, if Sawyer and Man are not joint inventors, then the interference must necessarily be dissolved.

2. In determining that the conductors of the respective parties were "substantially the same," because both employed paper, and both papers were adapted for use in incandescent electric lamps, without taking into consideration the other essentials which in law enter into the comparison of two things, asserted to be "substantially the same," viz., a similarity in the mode — operation, and in the result attained.

Having found that Sawyer first suggested the use of paper for carbons for incandescent lamps and that both Sawyer and Man participated in subsequent experiments in treating the paper after it was carbonized.

3. In determining that under such circumstances Sawyer and Man were joint inventors of carbon conductors made of paper.
